Methods. This analysis is part of an AIDS Community Outreach Project funded by the National Institute on Drug Abuse. Over 500 IVDS are in treatment were recruited and interviewed with a focus on needle using and sexual behaviors. Bloods were drawn and analyzed for the presence of HIV antibody using ELISA and Western Blot techniques. Generation was obtained by asking date of birth and categorizing age into three categories: Post baby boomers, those born after 1928; baby boomers, those born 1929-1946 and pre-baby boomers, those born prior to 1946.

Results. Generation differences in risk behaviors and seroprevalence exist. While post baby boomers have drug use patterns and sexual behavior patterns similar to the other generations, they are more likely to clean their needles and have fewer partners. Associated with these behavioral differences is the finding that post baby boomers have a seroprevalence rate of 15.7% compared to 23.7% of the other two generations (significant at the .005 level).

Conclusion. Younger generations of IVDS are more receptive to AIDS prevention strategies and most ready to change high risk behaviors.

Th.D.P.51 COCAINE, MARIJUANA AND ALCOHOL AS RISK FACTORS FOR HIV INFECTION IN SEROCONVERTED INDIVIDUALS: A PILOT STUDY

John D.L.,* Nordstrom, J., Allen, M.,** Boyce, L.,** Specko, P.,** Weinrich, J.,** Mulgrew, C.,** et al.,** UICD AIDS Cohort Study, San Diego State Univ., and University of Calif., San Diego, 1986

Objective. To study the association between use of cocaine, marijuana, alcohol and HIV infection in homosexual men.
Methods. Drug, alcohol, and medical histories were compared in 50 HIV infected (HIV+) homosexual men and 44 HIV uninfected (HIV-) homosexual men, all without a history of intravenous drug use. Sexual histories of 11 HIV+ cases and 11 HIV- controls with were compared for the 7-year period (1978-1984) during which infection occurred and before they were told their HIV status.

Results. Odds ratios and multiple logistic regression analysis revealed a significant association between number of years of cocaine use and HIV seropositivity (p<.01). Odds of being seropositive increased with more prolonged exposure to cocaine (OR=3.7). HIV was weakly associated with levels of marijuana use, but not with levels of alcohol consumption. Analysis of the sexual histories of the sub-sample suggested an association between high-risk sex and levels of cocaine usage.

Cocaine Use	HIV	Total	Odds Ratio (HIV+)	Odds Ratio
0	9	25	1.00	
1-3	16	23	1.00	1.78
4-26	25	37	2.08	3.72

Conclusion. Cocaine, in contrast to alcohol and marijuana, may contribute to risk of HIV infection by promoting risky sexual behaviors.

Th.D.P.53 MODE OF HIV TRANSMISSION AND SEROCONVERTED INTRAVENOUS DRUG USERS IN SEROCONVERTED INDIVIDUALS: A PILOT STUDY

Brown, Lawrence S.; Nemoto, T.; Primm, R.J.; Foster, K.J.; and Chu, A. Addiction Research and Treatment Corporation, New York City, USA.

Objective. To investigate mode of HIV transmission among seroconverted IVDS, especially those on their drug and sexual behaviors.

Methods. A total 641 subjects (218 in '87 and 233 in '88); 627 males and 114 females; 311 HIV+ and 330 HIV- were recruited from methadone clinics in Manhattan and Brooklyn, New York City. After informed consent, a standardized questionnaire was administered by trained interviewers. Also, blood was collected and tested for HIV antibody by ELISA and Western Blot techniques.

Results. The overall HIV infection rate was 60% in 1987 and 52% in 1988. In 1987 and 1988, respectively, 19 of 23 and 23 of 40 subjects, who admitted to a previous HIV seronegative result, were found to test HIV seropositive. These suspected seronegatives significantly differed from subjects who remained seronegative in frequency of sharing needles (p<.01), sharing cookers (p<.02), and use of shooting galleries (p<.05) during the last 5 years. Among 1987 cohort group, all those who remained seronegative stopped sharing needles, but 12 out of 18 subjects who seroconverted still shared needles.

Conclusion. Needle-sharing behaviors continue to be associated with HIV seroconversion among IVDS. More effective education to stop needle sharing among IVDS is needed.

Th.D.P.50 IVDS CHARACTERISTICS ASSOCIATED WITH NEEDLE SHARING

Donald Wallace, Vishov S. Goss, J. Thelma Study, Johns Hopkins School of Hygiene and Public Health, Baltimore, MD, USA.

Objective. Ascertain characteristics associated w/needle sharing in cohort of active IV drug users (IVDU).

Methods. IVDS were recruited for a prospective natural history study of HIV infection from street outreach clinics, hospitals and drug treatment programs. Characteristics were compared among IVDS who reported or denied needle sharing in the preceding 6 months.

Results. Among 441 active IVDU's, 469 (70%) reported sharing needles in the preceding 6 months. Race, sex, age and marital status were not associated with sharing.

	Share + (%)	Share - (%)	P Fisher
Daily user	48	30	<.0010
Cocaine - other drugs	80	91	<.0000
Started before '80	87	85	<.0000
Unemployed at least 1 yr	71	78	<.0100
Pub. assist. for 1 yr	73	72	<.0100
Homeless for a period	50	48	<.0100
Arrest in last ten yrs	82	78	<.0001
Arrest withdrawn	39	39	<.0001
Used gallery	49	11	<.0001

Conclusions. Most currently active IVDS's in this sample (70%) reported sharing needles. The inability to head off serious withdrawal symptoms, more frequent use and economic destitution may be driving forces for needle sharing and gallery use. Multivariate analyses are being carried out.

Th.D.P.52 AIDS-RELATED KNOWLEDGE, ATTITUDES, AND BEHAVIOR IN TREATMENT FACILITY

Milutin, Marzetta,* Coates, R.,* Devesy, P.,** Frankin, T.,** Rankin, J.,** Department of Preventive Medicine and Biostatistics, University of Toronto and **The Addiction Research Foundation, Toronto, Ontario, Canada

Objective. To describe AIDS-related knowledge, attitudes and behavior in a group of Canadian injection drug users (IDUs).

Methods. Over a 3 month period, 90/100 (90%) attending a Toronto treatment facility completed an anonymous, self-administered questionnaire.
Results. Of the 81 male and 29 female respondents, 44% were under 30 and 90% were under 40; 90% were heterosexual; 34% reported more than one sexual partner in the past year, with 12% reporting 10 or more. Most had a drug problem for more than 5 years (50%). The common primary drug was heroin (61%), with 20% being mainly cocaine users. 71% reported needle-sharing within 5 years, 34% within the preceding month. 90% knew that heterosexual spread of AIDS. 84% were personally willing to be tested for HIV and 20% already had been (all were negative). 20% would change their drug use behavior if they received a negative test; 8% their sexual behavior; 15% indicated uncertainty as to how they would deal with a positive test, while a further 12% would consider suicide or resume heavy drug use. Current needle sharers could not be distinguished from former needle sharers on selected demographic, attitudinal, and knowledge variables.

Conclusions. IDUs are sharing needles despite knowledge of the risk. For those testing positive, there may be a risk of self-destructive behaviour. Testing should be done only with excellent counselling and ongoing support.

Th.D.P.54 INPATIENT OUTREACH WITH INTRAVENOUS MINORITY DRUG-USING AIDS PATIENTS: IT CAN BE DONE

Joseph, Deborah; Graham, V.; Kitchens, A. King's County Hospital AIDS Team, Brooklyn, New York, USA.

Objective. To use a group approach to increase coping in a population often thought to be unresponsive, defended, and non-responsive to benefits from such a modality. Purpose(s): 1) educate about diagnosis, services; 2) reduce isolation and depression; 3) bridge to aftercare services; and 4) optimize education and counseling services.

Methods. Large city hospital with daily AIDS census of 65 serves a poor minority community. Patient population in mostly street/room 3-drug/truck users. General nursing staff support adjacently helps motivate patients to attend group. The nurses and a social worker use supportive techniques to facilitate this twice-weekly, voluntary, confidential group.

Results. Group size ranged from 8-13. Patients freely self-disclosed and verbalized. They displayed a capacity to both give and receive support. Patients resolved confidentiality issues through discussion, and without reticence processed themes of stoicism, sexual responsibility, stigmatization, and maintenance of hope. Patients rapidly developed a sense of ownership of the group and acted as outreach to other isolated, non-disclosed patients.

Conclusions. Outreach to expectant concerns that patients would have great difficulty allowing their diagnosis to be revealed among their peers, patients did together to affirm their commonalities to form a constructive camaraderie. The stereotyped image of this population as being incapable of bonding and emotional interdependence is inaccurate. Thus, organized peer support is a necessary part of social work with this population.

Th.D.P.67 LONG TERM FOLLOW UP OF A COHORT OF DRUG ABUSERS OF THE AREA OF FRUGIO BILLIA (NORTH ITALY)

RES. Ghisla R.A., Vanni F., Tomasi A., Galardi G.F., Divisione Malattie Infettive, Ospedale S. Maria Annunziata, Frugio Billia, Italy.

Objective: To monitor the natural history of the disease in the drug addict and as drug addict.

To assess risk factors and progression in AIDS.

Methods: In May 1985 we began a long-term follow up programme of 106 and ex 106 with HIV infection, who live in the area of Frugio Billia (North Italy). This study is being carried out on about 100 patients thanks to collaboration among the Department of Infectious Diseases, the Rehabilitation Centre of the area and the prison.

We think HIV began to circulate among IVDA in our area in 1980-1985.

170 IVDA HIV with 20 AIDS cases were found out in December 1986. 100 HIV with 30 AIDS cases have been found out up today. The patients are followed with six-monthly check up at Day Hospital, which consist in medical examinations as an serologic, immunologic, and histomorphologic tests.

113 patients HIV infected, in II and III stage of the CD4+ classification, were enrolled from June 1986 to June 1988. 79 of them have completed 3 years of their follow up at least, 9 of them died 3 for the AIDS, 1 the remainder didn't present themselves for the following controls.

In this study we are describing these subjects in their clinical development (according to the classification) and on the ground of some parameters beginning year of the usual drug use, passing months on the street, contracted positive tests for HIV antibodies, total number of injections, number of HIV, HLA-antigen, IgG, positivity of HIV-antigenemia, other risk factors as homosexuality and/or prostitution.

Th.D.P.68 A STUDY COMPARING HIGH HIV-RELATED DEATH AMONG HIV-SEROPOSITIVE IVDA'S WITH DEATH AMONG SERONEGATIVE IVDA'S: THE HIV-PREVALENCE AND THE SERO-CONVERSION RATE AMONG IVDA'S.

Christian Solbach, Peter Kittelsen, Finn Jensen, Oslo City Health and Environment Department, Per Magnus, Norwegian National Institute of Public Health, NORWAY

OBJECTIVES: The Department of AIDS Prevention runs a testing and counselling clinic as well as an out-patient clinic for HIV-positives. The clinics have since the epidemic among IVDA's become known been the most visited testing and counselling facility for IVDA's in Oslo. Between August 1985 and January 1989 approximately 1000 IVDA's have registered at the clinic. The seroprevalence and the sero-conversion rate among the tested IVDA's will be presented. The main objective of the study is to estimate the mortality rate among all 1000 IVDA's registered, and to compare sero-positives and sero-negatives. The mortality rate will be studied with respect to other background factors.

METHODS: The 1000 IVDA's represent between 25000 and 40% of the IVDA population in the Oslo area. All clients at the clinic seek it voluntarily. All information regarding deaths and causes of death are based on statistics obtained from the Central Bureau of Statistics. The viroserological results are based on tests taken at the clinic, or first reported to us by the clients and then confirmed by the department. The causes of death will be presented graphically. Survival analysis utilizing Kaplan-Meier plots will be used to compare the hazard rates of the two groups.

RESULTS AND CONCLUSIONS: Results, statistics and conclusions will be available and presented at the conference.

Th.D.P.69 METHADONE MAINTENANCE IN HIV-INFECTED IV. DRUG ADDICTS - MEDICAL AND PSYCHOSOCIAL EFFECTS

Walter Feyer, P. Baumgart, G. Wiles, L. Kuder, P. Heyen, K. G. Dorst

University of Medicine, University of Wuerzburg, F.R.G.

Objective: to study the effects of methadone maintenance in AIDS-ARC-IV drug addicts on medical, psychological and social parameters.

Methods: open prospective study 30 IV. drug addicts (CDC IV, WR 3-4) were enrolled before and during methadone maintenance. Clinical and labor data, psychological and quality of life parameters and toxicological screening tests were evaluated. The study was based on cooperation between general practitioners, the HIV-outpatient department staff and institutional psychosocial support.

Results: We evaluated data of 30 patients (20 m 10 f) mean age 29,12y, after an average methadone maintenance of 13 (5-24) months. 3 of 30 patients had relapsed; 2 of them only for several weeks. Medical parameters were improved in 20 of 23 patients body-weight, secondary complications due to HIV and drug addiction, infectious/fungal. Psychological parameters were improved in 17 of 23 patients. Stabilization could not be achieved in 4 patients because of ongoing IV. drug addiction of their partners. Drug-delicts stopped in all patients, prostitution in those, who remained in methadone therapy. Positive effects due to quality of life were noticed by all. Change of HIV-stage was observed in only 3 patients, 2 of them after relapse.

Conclusion: chronic HIV-infected IV. drug addicts do benefit from a controlled methadone maintenance. Most of them did stop IV. drug addiction, drug delicts and prostitution as a necessary condition of medical and psychosocial stabilization. Cooperation of all medical and psychosocial institutions is of paramount importance. In addition this stabilization has its place in regard to prevent further spread of HIV-infection.

Th.D.P.70 THE USE OF STERILE SYRINGES AMONG IVDA'S WHO DID NOT UNDERGO INTENSIFIED TREATMENT AT 1986

J. CITERIO, P. HEALTH PRODUCER IS ADMIN.

Marcelo Barron, Juan Carlos P. Banchero, P. Utrera and E. Wallace.

Doctor, Madrid City Center for D.S., Terraza de Arden (Madrid); Doctor, Madrid City Council, see Bureau and Office, Madrid City, SPAIN

Objective: to study the influence of AIDS prevention campaigns message on IV IVDA that had been treated with cisindine, with regard to changing of habits and to permanence.

Methods: Reality-epidemiological inquiry on the present situation of 72 IVDA who were treated with cisindine during 1980-1987, with regard to drug dependence and AIDS risk habits.

Results: 50 IVDA out of the 72 IVDA answered the question: 18 of them were 20-24 years old, 25 were 25-29 years; 47 of them (85%) were males and 5 (9%) females; 82.5% had been IVDA for 9-17 years. The economical level of the group was 49% under the minimum wage. In Jan '88, 18 were unemployed, 5 relapsing periodically and 20 remained 20%. Habits regarding HIV risk infection: 80% have a better health control; 70% have spread out prevention methods; 43% improve alimentacion habits; 58% improve daily hygiene habits. Out of the 26 staying 30, 5 suffering 11 occasionally users and 6 remained daily IVDA. As for the spreading of AIDS control methods, as health workers we point out: 60% bring us our drug addicts to the center; 80% recommend the use of sterile syringes; 5% recommend the use of condoms. None of the 20 IVDA use shared syringes. 2 of them occasionally, and 18 of them use individual syringes.

Conclusion: the above reveals the importance of the detoxification treatment even if there are relapses due to the influence on the subsequent health condition.

Th.D.P.71 SURVEY OF THE METHADONE TREATMENT PROGRAMME OF THE OUTPATIENT CLINIC OF THE VIENNA PSYCHIATRIC UNIVERSITY HOSPITAL

Walter Feyer, Franziska C. O., Fersmann, D.,* Hutterer,

* Fersmann, V.* Gollwitzer-Lobos, K.*

Psychiatric University Hospital, Vienna, Austria, * Osterreichische AIDS-Hilfe (Austrian AIDS Foundation), Vienna, Austria.

Objective: to present a survey of the structure and status of the patients in the programme mentioned above.

Methods: The outpatient clinic mentioned above has been carrying out a methadone detox and maintenance programme since October 1982 and has by now the largest number of patients in Austria. The data presented are results taken from routine documentation.

Results: The following data (average values) concerning the 99 men and 37 women treated were obtained: age at the start of the methadone treatment: 29 years; age at first contact with drugs: 16 years; length of opiate dependency: 12 years; in methadone treatment: 8 months; first methadone dose: 55.25 milligrams; present-day dose: 77.7 milligrams; HIV positive: 44% (75% men, 25% women); polytoxicant addiction of the HIV positive patients at the time of methadone adjustment: 55% (73.3% men, 26.7% women); working profession at the start of methadone treatment: 21.3%, working since methadone substitution: 30.9%; previous convictions (drug abuse offences): 64.7% (73.5% men, 20.5% women); total number of convictions: 18.9% opiate, 5.1% methadone, 0.7% solvent, 3.0% unknown; couples in treatment: 13.2% (both are HIV infected: 33.3%, one partner is HIV infected: 22.2%, both partners are negative: 44.4%).

Conclusion: The programme promotes social and occupational reintegration.

Th.D.P.72 AIDS RELATED BEHAVIOR AND ATTITUDES

AMONG IV DAUROS UNDER IN CARE

A. Eklund, A. Ahlman, C. Sallsten

Department of Psychiatry, Alms University Medical School, Almsna, Greece

Objective: Data presented in this study emphasize an attempt towards the identification of possible factors influencing the low transmission rate (seroprevalence rates lower than 1%) of HIV among Greek IV drug users. Methods: Randomly selected in the visit transactions such as needle and syringe sharing practices and sexual behavior have been investigated in a sample of 127 IV drug users who were in contact with health services. Subjects were additionally asked on the main reasons to which they had resorted to AIDS as well as on their personal beliefs and attitudes related to the risks of infection.

Results and conclusions: Frequent injection frequency, high drug usage, practicing such as sharing of syringes and needles, and sharing of needles, were the major risk factors (75%) while only 37% of them were changed such practices due to the appearance of AIDS. Concerning their sexual behavior the majority (83%) use safety (SR) or even never (81%) condoms during intercourse. From those reporting homosexual contact (20%) the large majority has sexual contacts with both sexes. Half of the population stated not having changed sexual behavior after the appearance of AIDS. Low levels of awareness and sense of responsibility in HIV transmission changes is further confirmed by the high rates of those who believe that it is easy or even totally impossible to be infected by the virus (10%). Moreover respondents expressed the belief that the level of awareness for HIV transmission among subjects in their environment is low to non-existent (80%) and that no change has occurred in behavior (70%). A minority only (30%) considered as main source for the present information on AIDS health professionals, while for the majority (70%) the main source of information were the mass-media and mainly periodical press. Findings are discussed along with implications on the possible reasons of low HIV prevalence among Greek IV drug users. The study was supported by the Greek AIDS implications were discussed. WHO approved study has been used as a basis for the initiation of an ongoing more extensive and continue WHO supported study.

Le SIDA et l'individu AIDS and the Individual

Th.D.P.79 CLINICAL SYMPTOMS AND MEDICAL HISTORIES OF A COHORT OF IV DRUG USERS: CORRELATION WITH HIV SEROPREVALENCE

Editors: Margot K., Vlahov D., Solomon L., Lindsey A., Chodura N., The ALIVE Study, Johns Hopkins University, Baltimore, MD, U.S.A.
Objective: To ascertain the frequency of clinical symptoms and histories of medical illnesses and their correlation with HIV seroprevalence in a cohort of active IV drug users (IVDU).
Methods: A cohort of active IVUDs were recruited for a prospective study of the natural history of HIV infection from street outreach, STD clinic and STI & drug treatment centers. Persons with AIDS were excluded.
Reported symptoms and medical histories from baseline questionnaires were correlated with HIV serological data (ELISA and Western confirmation).
Results: Overall 441 (84.7%) of 519 participants were HIV seropositive. Significant associations were as follows:

HIV +	HIV -	P-value (Chi-square/Fishers)	
Dyspnea	7.4%	11.6%	0.007
Fatigue	18.9%	22.9%	0.079
Weight loss	28.7%	30.3%	0.007
Oral Thrush	1.8%	4.3%	0.011
Hg. Bacteremia	0.2%	1.4%	0.009
Hg. Endocarditis	0.5%	1.4%	0.063

Histories of the following were associated with HIV status: Bacterial Pneumonia, Tuberculosis, Syphilis, Cirrhosis, Tuberc. of bladder, etc.
Conclusion: Although symptoms associated with AIDS-related events are frequent among active IVUD's who are seronegative, several symptoms are significantly more common in HIV seropositive IVUD's.

Th.D.P.81 THE USE OF A BEHAVIORAL INTERVENTION AS PART OF A RISK REDUCTION STRATEGY AMONG INTRAVENOUS DRUG USERS

Christie, Ang, Daw, M.C.T.
 Department of Clinical Psychology, Consulting Clinic, Ruchill Hospital, Glasgow, UNITED KINGDOM

Objective: To develop a minimal behavioral programme aimed at increasing behavior change towards safer sex and drug use among intravenous drug users (IVDU).

Methods: A booklet was developed following behavioral principles consisting of the following sections: Assessment and feedback; Knowledge test; Drug risk, monitoring and identifying client's own risk situations, using problem solving to find better ways to cope with risk, common risk situations and ways to solve them; Sex risk, choosing partners and using condoms; Identifying risk situations and ways to cope with these; Local information. The format of the booklet is written with local drug users in view. The booklet was developed with the help of groups of clients in residential drug treatment agencies who tested and commented on each section.

Results: A booklet has been developed successfully prior to formal evaluation.
Conclusion: Behavioral interventions offer a great deal to those who wish to change their behavior but have difficulty translating their intentions into practice. So other educational packages offer specific advice on monitoring and altering specific areas of difficulty which lie behind making such changes.

Th.D.P.83 COMPARISON OF SEXUAL BEHAVIORS AMONG WHITE IVUD AND NON-IVUD (MIVUD) HETEROSEXUALS IN SOUTHEASTERN NEW ENGLAND

Meyer, Kenneth; Zierler, S.; Falgout, I.; Lauffer, D.
 New England Behavioral Health Study (NEBHS), Brown University, Providence and Memorial Hospital, Pawtucket, RI, USA.

Objective: To compare sexual behavior and risks of HIV transmission or acquisition of white IVUD and MIVUD in an area where > 1/3 PWAs are IVUD and the prevalence of non-HIV STI is lower than the U.S. average.
Methods: Cross-sectional analysis of in-depth interviews and serologies from the first 175 white enrollees of a community-based prospective study of the heterosexual spread of HIV in New England among self-identified high risk heterosexuals. The full cohort is 813 white.
Results:

	IVUD (%) (n=212)	MIVUD (%) (n=113)
HIV seropositivity	40%	3%
> 1 partner for the past year	61%	21%
> 50 lifetime partners	36%	21%
Sex with an IVUD	61%	21%
History of STD (ever)	45%	30%
Always used condoms for the past year	12%	5%
Never used condoms for the past year	43%	44%

Conclusion: Although IVUDs are more likely to be HIV+ than MIVUD and have sex with other IVUDs, a higher percentage of IVUD always used condoms. Routine condom use was uncommon in both groups. Heterosexual transmission of HIV among white IVUDs was documented. HIV+ IVUD frequently had sex with MIVUD and a subset of HIV+ IVUDs are continuing to place themselves at increased risk for acquiring HIV.

Th.D.P.80 RISK FACTORS FOR TRANSMISSION AND CHANGES IN RISK BEHAVIOUR AMONG IV DRUG ADDICTS (IVDA) IN GENEVA

Robert Claude P., Delgion J., Hirschel B., Pujuguet de Melédine, Div. of Infectious Diseases, University Hospital, and Ermitage Foundation, Geneva, Switzerland, phone 41 22 24 64 18.

Objective: To evaluate risk factors and behaviour with regard to transmission of HIV. Methods: IVDA serum samples were collected since 1983. From 1983 to 1988, IVUDs were interviewed once (223 IVDA), twice (115), and more than twice (30).
Results: Among antiretroviral addicts in an outpatient methadone maintenance program, seroprevalence increased from 7% (5/70) in 1981 to 36% 56/154 in 1988. In 1986-1988, however, 47/88 (53%) of IVDA patients were seropositive.

Table 1 Sharing of needles and syringes (sharers) and non-use of condoms.

Hiv status	before 1987		1987 and 1988	
	sharers*	no condoms	sharers*	no condoms
Seropositive	91% (44/70)	88% (34/56)	5% (2/43)	54% (29/69)
Seronegative	82% (28/34)	50% (46/49)	29% (7/14)	75% (24/32)

*among those still injecting
 10% of men have had sexual relations with homosexuals, and 80% with other IVDA. Among a subgroup of 53 HIV+ IVDA, 31 had a stable sexual partner. Of 18 partners tested, 11 were HIV+, in a sexual transmission was the only probable route of infection.
Conclusion: Among IVDA in Geneva, sharing of needles and syringes has greatly decreased since 1986. However, there remains a potential for sexually transmitted infection. Future preventive strategies aimed at IVDA's must take this into account.

Th.D.P.82 A COMPARATIVE ANALYSIS OF HIV INFECTION AMONG IV DRUG USERS IN TREATMENT AND ON THE STREET

McDory, Clyde L.; Chitwood, D.B.; and Page J.A.*
 *University of Miami School of Medicine, Miami, FL, USA.

Objective: To compare the seroprevalence of HIV among IVUDs in treatment and on the street and to determine the difference in distribution by age and ethnicity/race.

Method: Two separate studies in the Miami metropolitan area have recruited 500 IVUDs respectively from drug treatment programs and from the street. Blood samples were drawn from the clients within the treatment program, or for the street sample at a centralized assessment center at the medical school. Pre and post test counseling were provided in similar fashion to each of the groups as they were given similar assessments of their sex, drug and other histories.

Results: The street population indicates a much higher seropositivity (33%) than the treatment population (13%). Ethnic data indicate no exception, showing more males to be seropositive in treatment (16%) than in the street population (8%). The treatment population is predominantly white (74%), whereas the street population is predominantly black (83%). However, in versus 61 white in the treatment population, 315 black versus 174 white (at the street). Overall, females are of greater seropositivity than males.
Conclusion: It is extremely important to actively recruit and establish prevention and control measures for the street population of IVUDs, as well as for those in treatment because of the potential high risk for transmission of HIV.

Th.D.P.84 PSYCHOEDUCATIONAL GROUP APPROACH TO AIDS PREVENTION WITH DRUG ABUSERS IN RESIDENTIAL TREATMENT: IMPACT 6 MONTHS AFTER INTERVENTION

Sorlessen, James J.; Gibson, D.L.; Reitzman, G.; Dumontet, R.; Costantini, M.; Melrose, J.; et al.
 Center for AIDS Prevention Studies, UC San Francisco, CA USA

Objective: To assess the impact of 6-hour psychoeducational groups on the AIDS knowledge and attitudes of drug abusers completing residential treatment.

Methods: 96 drug abusers in the latter stages of treatment were randomly assigned to receive a 6-hour group protocol or a set of brochures about AIDS. Assessment interviews occurred before randomization, after the intervention, and 6 months after the pre-assessment. Subjects averaged 84% attendance at training. HIV tests were reached for the post-interview, and 81% (of 79 due to data) have been reached for 6-month follow-up. Measures were designed to tap AIDS-related knowledge, risk, perceived threat, response efficacy, self-efficacy, communication skills, and social supports.
Results: There was a significant effect at the post-interview in the expected direction in knowledge of AIDS risk ($p < .006$) and a trend in the expected direction in self-efficacy ($p = .07$). 6 months the knowledge difference had faded, but the differences in perceived self-efficacy had become more pronounced ($p < .02$).

Conclusion: Conducting AIDS education groups in a residential treatment setting can increase participants' knowledge and change some attitudes that put them at risk of acquiring or transmitting HIV. Further research and interventions are needed that are more focused, potent, and long-lasting.

Th.D.P.86 AIDS AND SUBSTANCE USE EDUCATION AND PREVENTION: A COMMITTEE-BASED APPROACH.
Allen, David; Beckman, R. W. and Shyne, G.***
 *Municipality of Metropolitan Toronto, Toronto, Ontario, Canada.
 **Alexandra Park Community Centre, Toronto.
 ***Health Care Consultants (HCC), Toronto, Ontario, Canada.
Objectives: 1. To provide the information and behavioral change skills necessary for prevention of AIDS to substance users. 2. To train workers in effective training techniques for bringing about knowledge and behavior change in substance users. 3. To assure that all those in need have access to bleach and syringe-exchange education programs and related services. 4. To provide advocacy for substance users.
Methods: With personal financing, volunteer labour, donations and the various resources available to community groups, this program initiated AIDS and substance use education (including workshops for workers), provision of bleach-kits, opening of syringe-exchange education programs, and assessed advocacy for substance users. The program relied on community support and networking, free services from health-care and other professionals, and the donation of money, time and supplies from many sources. The key component of this program appeared to be community concern and networking.
Results and Conclusions: Nearly thousand bleach-kits have been distributed through this program. A number of community groups now offer syringe-exchange education programs; a mechanism for formal training of trainers in AIDS care has also been established; general public education on AIDS and substance use is ongoing; advocacy for substance users is increasing in strength. In the absence of government leadership or funding, community groups can effectively provide AIDS education, prevention, and other services if they use networking and shared resources.

Th.D.P.86 MANAGEMENT OF HIV-INFECTED FEMALE IVDA'S
Friedmann*, Schfer, Axel*, Heckmann, Eck*, Schwärtdländer**.**
 *Department Obstetric and Gynecology, Freie Universität Berlin
 ** AIDS Research Center, Bundesgesundheitsamt, FRG
Objective: To evaluate the effects of methadone treatment in a clinical center for Gynecology.
Methods: Maintenance to abstinence by step wise reduction in three different groups of a total collective of 71 women.
 Group 1: 31 HIV-negative pregnant women
 Group 2: 19 HIV-positive pregnant women
 Group 3: 21 HIV-positive non-pregnant women
 Evaluated by clinical documentation and drug tests (salivary). In group 1 39 % reached total abstinence before delivery, in group 2 only 16 % and in group 3 67 % reached total abstinence during period of in- or out-patient care; significant differences were found between in-patient and outpatient care.
Conclusions: Maintenance programs are not very common in the FRG
Results show, that indications of methadone treatment should be very selective. The sources of maintenance - to abstinence depends on very different factors, such as drug status, social support, clinical program, personality, and serology of HIV.

CHANGES IN THE SEXUAL BEHAVIOR OF HIV INFECTED PATIENTS PARTICIPATING IN A PCIP PROCESS.
David L. Garcia L., Salame E., Hernandez MP*
 *Division of Epidemiology, Ministry of Health, Mexico
Objective: To induce changes in the sexual behavior and use of condom as a preventive measure of contracting HIV sexual transmission. In a group of HIV seropositive homosexual men.
Methodology: 38 seropositive, homosexual, asymptomatic, unmarried men, aged between 18 and 45 years old requesting psychological support were selected. The individuals were assigned to 3 groups: A (3 months), B (6 months), C (1 year), (60 sessions, 1 x wk). Several psychosocial group techniques, such as interpretation and free association, were used. Killing fantasies, inability to establish total object relations, hostile feelings towards homosexuality, uncertainty of presenting clinical symptomatology and dying were interpreted in group sessions with the purpose of promoting condom use and modifying risky practices. Changes were evaluated at the end of 4 sessions.
Results: The results are presented in the following table:

	GROUP A		GROUP B		GROUP C	
	Pre	Post	Pre	Post	Pre	Post
BEHAVIOURS	No.	No.	No.	No.	No.	No.
Use of condom	0/12	11/12	0/12	12/12	0/12	10/12
Safe Coitus	2/12	2/12	3/12	6/12	6/12	4/12
Hostile feelings for being homosexual	4/12	4/12	6/12	3/12	12/12	3/12
Unpleasant presenting symptomatology	12/12	12/12	12/12	12/12	12/12	12/12

 Groups A and B and 6 months groups were associated with changes in sexual behavior, the one year group structural changes and in the condom's use.

Th.D.P.89

COUNSELLING AND EDUCATION ON AIDS.
Quares, Eleonora Paji, Rendic de Lacerda, M.C., Neman, J.J.L., Lemp, P.P.F., Moore, C.M., Carvacho Melo, L.L. et al.
 *Officer at a Public University Hospital - University of Rio de Janeiro - Brazil.
Objective: To inform people about AIDS transmission/acquisition, prevention, safe sex and the disease.
Method: Psychiatrists, psychologists, social workers and nurses during private sessions at a HIV-1 outpatient unit of our hospital and at conferences in schools, churches, poor communities, bars, industries and other groups; either multiprofessional lectures where all aspects of AIDS are explained or case studies and other exercises with simple language to be easily understood. After the explanation there is an interactive question session when all the remaining doubts are solved.
Results: The most common questions are about oral, anal, vaginal sex, kiss, meninges, mosquito bite, syringe, vaccine, cure, blood transfusion/blood tested, when to find the AIDS test, when to find treatment. It was more difficult to explain, be understood and be accepted: all information about condom/safe sex when talking to male adults. There is a greater concern among women than men about learning how to explain or talk about AIDS with their children. It was difficult to talk openly about sex and drugs with adolescents because teachers and parents are not prepared to cope with sex and drugs subjects.
Conclusions:
 1. Despite being a volunteer work without any support, we are doing our best.
 2. More support should be given for counselling and education on AIDS because they are the only way to stop the AIDS epidemic.
 3. A special attention should be given to adolescents because they are learning about life, love, sex and drugs at this very moment and they have the right to live long.

Th.D.P.90

HIV-AIDS Counselling & Collaborative Project
Gowanlock, Kenneth and Findlay, Joel, Federal Centre For AIDS
 Ottawa; Carballo, Manuel, Global Program on AIDS, World Health Organization, Geneva/SWITZERLAND
 There is a growing need to enhance the availability and quality of counselling for persons with HIV infection, those with AIDS, their families and others affected.
 The Federal Center for AIDS Canada, in collaboration with the WHO/GPA and collaborating Canadian provinces has developed a planning approach for improving, expanding and maximizing existing counselling resources in order to increase the capacity for HIV counselling in any community. This initiative, a world first, examines, defines, and facilitates development of the common elements of counselling needed when dealing with HIV and AIDS. The approach looks not only at a common methodology for such counselling but at necessary co-ordination of existing services for the strengthening and expansion of counselling networks. Implicit in the approach is the enhancement of collaboration between health, social service and community based organizations.
 This presentation will highlight training needs both in the formal health-social service system and in the broader community based non-governmental area, and provides for this training to be put in place.

EXTRAORDINARY WITHOUT ORDINARY SEXUALITY
Seth L. Baker, Director, Sexuality Division, Calgary Health Services, Calgary, Alberta, Canada

Objective: Education emphasizing negative aspects such as, AIDS, STD's unwanted pregnancy focuses on "extraordinary sexuality". When negative information is stressed, social and behavioral strategies necessary for the integration of information and utilization of preventive actions are missed. PARENTS need to shift from a focus on extraordinary to ordinary sexuality.

Method: The Board of Health approached Calgary School Boards to present PARENTS on the extent of adolescent sexual activity, STD, and ectopic pregnancy. Current piecemeal and optional approach to sexuality education was compared to negative results of sexual activity. The Board of Health recommended that sexuality education programs be mandatory for all students. **Result:** Both school boards accepted the proposal and schools will have a comprehensive, sexuality education curriculum provided to all students by 1990. The Board of Health committed funds to training, inserviceing and support of teachers in the school system. **Conclusion:** In order to promote safer sexual behavior, public health and school officials must ensure that all students receive not only cognitive information about sexuality, but also a comprehensive curriculum that will examine feelings and the behavioral skills in order to practice safer sex techniques. To accomplish this, AIDS education must be placed in the context of comprehensive, compulsory, sexuality education. Public health agencies can have an impact of the decision to provide such education to a community.

D.503

**THE USE OF ONE EFFECTIVE MEDIUM - TELEVISION
TO REACH CANADIAN YOUTH AND PARENTS ABOUT HIV
AND AIDS**

Liebold, Heidi M., Federal Centre for AIDS, Health and Welfare

As a result of the Canada Youth and AIDS Study conducted with 38,000 youth across Canada it was found that a high majority of Canadian youth have received their information about AIDS from television. The Canada Youth and AIDS Study is representative of Canadian youth in grades 7, 9 and 11, first year University/College, Dropouts and street youth. Television as a main source about AIDS was not only prevalent in the in-school population but also those out of school such as dropouts and street youth. In response to this, the Federal Centre for AIDS of Health and Welfare Canada commissioned to undertake three national film productions. Two of these film productions are focused on youth and the third on parents. One of the youth productions will focus on the 12 to 14 year olds and the second on 14 to 16 year olds. The film production for the older population will have an original story and corresponding rock video segment that will be released separately and reinforce the messages of the film production. The parent film will provide parents with the needed information on HIV, AIDS and healthy sexuality but will focus on how parents can effectively communicate this information to their children.

D.505

**LE SIDA EN AFRIQUE CENTRALE - SYSTEMES D'INFORMA-
TION DES PARENTS ET DES ADOLESCENTS**
EVALUATION

• Département de Psychologie et de la Presse, Linguistique, Kinésithérapie, Centre de l'Éducation Nationale, Gombe, Kinshasa, Zaïre

Objectif: Évaluer le synergisme du rôle des médias ainsi que des hommes et des systèmes d'information sur le SIDA parmi les adolescents en Afrique Centrale.
Méthodes: Une enquête par sondage d'opinion relative à la perception du message sur le SIDA était menée parmi 3000 adolescents à Kinshasa (Zaïre) dont une moitié scolarisée et une autre non scolarisée en 1986.

Résultats: L'enquête a montré une l'indice de performance et d'efficacité des messages d'information est très faible. Leur acceptation est insuffisante pour le besoin d'une fonction d'intégration d'une forte proportion des adolescents (34,6%). Les résultats sont significatifs (96,9%) pour les scolarisés en ce qui concerne la perception du message et moins (50%) pour les autres. Cela se traduit aussi au niveau des canaux de communication.

Conclusion: Il faut agir sur un ensemble de reconstructions en vue d'améliorer les systèmes d'information opérationnels sur les perspectives de prévention et de traitement du SIDA, ainsi qu'au rôle des médias. Enfin, des suggestions sont aux variables immédiates à incorporer dans les programmes de santé publique sur le SIDA en Afrique Centrale.

D.502

**TITLE: HIV SEROPREVALENCE AND DEMOGRAPHIC SURVEY OF
INCARCERATED ADOLESCENTS**

Author: Baker, Charles J., Ba, O., Morris, R., Marcott, S., Rosenberg, J., and Schuller, R.

Journal: Court Health Services, Los Angeles County, California, USA

OBJECTIVE: To determine HIV Seroprevalence and I.V. drug abuse factors in adolescent incarcerated within the Juvenile Hall, County of Los Angeles.

METHOD: Blood samples were collected anonymously from 2,005 youngsters. **RESULTS:** The following were recorded: Age, Sex, Race, history of I.V. drug abuse and SGP/SGOT testing.

RESULTS: Only two samples were positive by ELISA and Western blot tests. 90% of the youngsters were between 15 and 17 years of age. 92% of were male. 69% were hispanic. 21% were black and 13% were white. History of I.V. drug abuse were recorded in 24 and 34 received SGP/SGOT tests.

CONCLUSION: HIV Seroprevalence this survey (0.099%) compares favorably with the 0.16 determined 1-1/2 years ago in the same type of population. This prevalence may suggest greater awareness of high risk behavior for AIDS among adolescents.

D.504

**A MODEL-DRIVEN AIDS EDUCATION AND COUNSELLING FOR
ADOLESCENTS IN AN IHO**

Blumenthal, C.J., Mc Schram, S., Mc and Long, G. Mc
Kaiser Permanente Medical Care Program, San Francisco, California and
Los Angeles California, U.S.A.

Objective: Within a pre-paid health plan population of over 5 million members, a targeted intervention model has been developed to identify adolescents at high risk for becoming infected with the AIDS virus.

Method: All health plan members age 12-21 who present for a health care visit by appointment are given a brief questionnaire to be completed in the waiting room before the encounter begins. Highest risk simple, brief questions about sexual activity and other risk behaviors are asked. A rapid review of the completed questionnaire allows the counselor to determine if the adolescent is at risk, no risk, or potentially at risk for AIDS. The questionnaire, once reviewed, is discarded, is not a part of the medical record, but allows a one to one confidential exchange between the teen and counselor. Those adolescents who are identified at risk are referred to a prevention counselor for evaluation of risk behavior, education on AIDS prevention and HIV testing, and most importantly, behavior modification. All adolescents referred to the model for counseling are re-evaluated in several months; behavior and risk taking is reviewed; education is reinforced. Adolescents not at risk are referred to an education component of the model.

Conclusion: Intervention affecting adolescent behavior change may be one of the most definitive methods of preventing high risk adolescents from becoming the next wave of the AIDS epidemic in the 1990's. Information alone is not effective in changing users' risk behavior. Our model of intervention in a nationwide HMO has the potential of changing the behavior of over a million adolescents in the USA.

D.506

**STRENGTHS LIFE EVENTS AND SOCIAL SUPPORT AS PREDICTORS OF
SAFE BEHAVIORS AMONG HERMAN AND GAY YOUTHS**

Rosenberg, Clara and Robinson-Davis, M., Bradley, J., and

Koopman, C., New York State Psychiatric Institute and Columbia University, New York, NY, USA

Objective: To evaluate the effectiveness of stressful life events and social supports as mediators of safe sex behaviors among runaway and gay youth.

Methods: A review of the literature, focus groups, and a chart review in community agencies were used to construct measures of stressful life events and social supports for runaway and gay youths. Test-retest reliability and internal consistency appear high for both measures. Ninety-five runaways and 30 gay youths were interviewed regarding their sexual behavior in the last three months, life events, and social supports.

Results: Runaways have four times the number of stressful life events as Hermans; however, 33% have had a death in the last three months. 12% were physically assaulted, and 20% raped in the last three months. The sexual behaviors of those in the social support network is most highly correlated with the adolescents' unsafe sex and drug use behaviors. Gay youths perceived their parents as less supportive and themselves as needing support more than runaway youths. Neither life events nor social support were significantly correlated with high risk behaviors. **Conclusion:** Life events and social supports may not be the most critical mediators of high risk behaviors among these groups.

- D.507** RISK FACTORS ASSOCIATED WITH A HISTORY OF SEXUALLY TRANSMITTED DISEASE AMONG ADOLESCENTS
Diclemente, Ralph, J. Forest, K.**, Wickler, B.***
** University of San Francisco, California, USA
*** Vassar College, Poughkeepsie, New York, USA.

Objective: To identify a profile of risk factors associated with a history of treatment for sexually transmitted disease.
Methods: A national sample of 1,129 college undergraduates, ages 18-23, completed self-administered questionnaires assessing knowledge, attitudes about AIDS, prevalence, type and frequency of sexual behaviors, frequency of condom use and history of treatment for sexually transmitted diseases.
Results: Women and minorities were twice as likely to be treated for an STD compared to males or Caucasians. (Prevalence Ratio (PR) = 2.0, Risk Confidence Limits (CL) = 1.4 - 2.8, P=.007) PR=1.9, CL=1.4 - 2.6, P=.001 (respectively). Unprotected sexual intercourse was also associated with a positive history of STDs (PR=1.3, CL=1.0 - 1.4, P=.09). Students with multiple sex partners and a higher frequency of sexual intercourse were also more likely to have reported medical treatment for an STD (PR=1.7, CL=1.3 - 2.3, P=.003; PR=1.3, CL=1.1 - 1.5, P=.007, respectively).
Conclusion: Identifying adolescents' behaviors which significantly increase the risk of STDs permits development of more effectively targeted education programs.

- D.509** EVALUATION OF A TARGETED AIDS/HIV EDUCATION PROGRAM FOR SECONDARY SCHOOL STUDENTS IN A MIDWINTER CITY METROPOLITAN AREA
Coppola, A. Greg*, Kistner, R.*, Ross, J.*, and Kurwin, M.*
*Marshall University, Huntington, Tennessee, USA

Objective: To evaluate change in AIDS/HIV knowledge level among secondary school students following a targeted education program.
Method: An education program was developed involving a minimum of two hours by trained health teachers. The curriculum stressed HIV modes of transmission and risk reduction measures. 500 students were pre- and post-tested with this intervention. The testing instrument: asked five demographic questions and 15 cognitive questions. Instrument sheets were also coded by health teacher.
Results: There was an overall gain in knowledge with the mean of correct responses increasing by three points on post-test scores as compared to pre-test scores. Sex, race, age, grade level, and residential area did not account for differences in pre- or post-test results. Significant differences in this student knowledge level were found in the post-test by teacher codes; such differences on pre-test results were not significant.
Conclusion: A targeted education program for secondary school students can increase knowledge about AIDS/HIV. Differences in the success of the intervention by classical demographic variables were not significant. Significant differences in the success of the intervention were found in regard to teacher codes. Based on the study results, the curriculum itself successful, however, this success was varied by teacher. Such variation suggests improved teacher training in the delivery of AIDS/HIV education.

- D.511** INTERVENTION MODEL: WORKING WITH GAY AND LESBIAN YOUTH AT RISK FOR HIV INFECTION

Hunter, Joyce MEd, CM

Herrick-Narwin Institute, Inc. New York, New York, USA.

Objective: To develop an effective, comprehensive intervention program for gay and lesbian youth who are at risk for HIV infection and train professionals to work with this population.
Method: The methods used are focus groups for youth, workshops, and community forums. We have worked with over 1,500 youth in the last year and a half. We also conduct semi-structured focus groups (four per week) and one per week for professionals. The young people that we work with are self-identified gays and lesbians. Seventy five percent of these adolescents are minority youth, ages 12-21 (55%).
Results: Development of training manual, printing and publication of articles and brochures.
Conclusions: Materials for this population must be specifically tailored for these adolescents and the professionals who serve them. In contrast to current U.S. providing explicit safer sex practice and guidelines instruction, these materials need to be extremely explicit sexually. Also, these materials need to reflect and acceptance of homosexuality.

- D.508** A COMPARATIVE ANALYSIS OF RISK BEHAVIORS AMONG A SCHOOL-BASED AND JUVENILE DETENTION FACILITY SAMPLES OF ADOLESCENTS IN SAN FRANCISCO, CALIFORNIA
Diclemente, Ralph; Duhan, R.
University of California, San Francisco, California, USA.

Objective: To describe a comparative risk behavior analysis of adolescents residing in a juvenile detention facility (JDC) and a school-based sample.
Methods: Adolescents, ages 14-18, attending high schools in San Francisco (N=802) and incarcerated at a juvenile detention facility (JDC) (N=113) completed identical self-report questionnaires assessing AIDS-related risk behaviors. Surveys were anonymous and completed during the same time-period.
Results: Significant differences in the prevalence of AIDS-RELATED risk behaviors were identified between the two samples. Adolescents at JDC report a higher lifetime prevalence of intravenous drug abuse (12.8% vs 3.7%, P=.003; PR=3.5, CL=1.8-6.7); more than three lifetime sex partners (86.4% vs 51.8%, P=.000; PR=1.7, CL=1.6-1.9); a greater proportion with multiple sex partners in the past year (84.8% vs 46.0%, P=.000; PR=1.8, CL=1.5-2.2); and an earlier age of sex onset (P=.0006).
Conclusion: Adolescents in juvenile detention facilities report a significantly higher prevalence of AIDS-related risk behaviors which substantially increases their risk of acquiring and transmitting HIV infection.

- D.510** KNOWLEDGE OF HIV TRANSMISSION AND ADOLESCENT SEXUAL BEHAVIOR

Wolke, D.**, Ziffer, A.**, Bywater, M.**, Bywater, L.*
*Rollins College, Winter Park, Florida 32789, U.S.A.

Objective: To assess how the knowledge of HIV transmission affects the sexual behavior of the adolescent.
Method: A survey of 210 students, 107 men and 103 women in 9th to 12th grade, was completed. Knowledge of transmission of AIDS, sexual activity, change in sexual behavior, and source of educational information on HIV infection was assessed.
Results: Of the adolescents surveyed, 67% of the men and 40% of the women were sexually active. Of those who knew the routes of HIV transmission, 56% of the men and 34% of the women had changed their sexual behavior. Of those who did not know the routes of HIV transmission, 70% of the men and 42% of the women were sexually active. Only 9% of the men and 12% of the women admitted they lacked accurate information about transmission of HIV infection. A full 60% of those surveyed operate with misinformation. Regardless of sex, sexual behavior, and accuracy of information, radio/television and magazines were reported as the most frequent sources of information about HIV infection. **Conclusion:** Adolescents are participating at alarming rates in high risk sexual behavior. While those most likely to be involved in high risk sexual behaviors are those with inaccurate information, what is disturbing are the numbers who know the risks but fail to alter their sexual behaviors.

- D.512** REPORT OF CMHA'S COMMITTEE ON SERVING CHILDREN AND YOUTH WITH HIV INFECTION IN RESIDENTIAL GROUP CARE.
Ezery, L. Jean*, Anderson, G. M.**, M. J. MD, Horowitz, R.W., Esq., Gitelson, P., Amin, J., East, J.P., et al.
*Child Welfare League of America, D.C. USA

Objective: To address issues of concern to Board members, executives, administrators, clinicians, and care staff and volunteers surrounding the care of children and youth who are emotionally disturbed, infected with HIV, and in need of therapeutic residential group care.
Method: A subcommittee of the Task Force on Children and Youth Infection undertook the challenge of writing a Guide for Residential Group Care Providers. Experts in legal, medical, and psychosocial issues associated with HIV met with experts in providing services to children who not only exhibit behaviors which put them at high risk for HIV infection, but who are also emotionally disturbed and who might have suffered abuse or neglect at the hands of their parents.
Results: The CMHA subcommittee 1) identified issues associated with administration, advocacy, and public policy, program procedures and prevention; 2) identified specific responses to those issues; 3) suggested strategies to achieve them; and 4) practices. **Conclusion:** It is feasible and appropriate to provide care and treatment of HIV-infected children in residential group care.

Publications

Le SIDA et l'individu
AIDS and the Individual**D.531** CHANGES IN SEXUAL BEHAVIOUR OF GAY MEN UNDER THE IMPACT OF AIDS. II

Bochow, Michael; Markert, Stefan
INTERSOZIA, Berlin (West); FEDERAL REPUBLIC OF GERMANY

Objective: To analyze whether further changes in sexual behaviour of gay men are still taking place and whether those already identified in a previous survey (1987) have proved to be stable.

Methods: A questionnaire of 62 questions on different topics relating to sexual behaviour and lifestyle of gay men was circulated by the seven most important gay journals in West Germany in October 1988. The questionnaire is almost identical with the questionnaire distributed for a first investigation in 1987. The 1988 survey is therefore a replication study. The response amounted to 122 questionnaires in 1987 (1987 = 100%).

Results: A preliminary assessment shows a remarkable stability of changes in sexual behaviour of gay men in West Germany. Low risk sex has proved to be accepted by an important majority of gay men. Gay men with a stabled gay identity are also the most successful in coping with the risk of HIV infection.

Conclusion: Efforts in prevention activities targeting specific subgroups of gay men are still to be intensified, namely gay men with a lower level of education and men with covert homosexual activities.

D.533 IMMUNE MODULATION FOLLOWING THE DEATH OF A COHORT: AN ANIMAL MODEL OF PSYCHOLOGICAL STRESS IN AIDS

Yashkovski, Eli; Shalonsky and Prince, E. Aron
Laboratory of Neuroendocrinology, NIDDK, National Institutes of Health, Bethesda, MD, U.S.A.

Objective: The psychological stress, experienced by AIDS patients following the death of their sexual partners or close friends, has been suggested to influence immune functions. An attempt was made in these studies to establish an animal model for this type of psychological stress.

Methods: We examined immune functions among several mouse strains (C57/BL₆, AKR/J and BALB/c) following the death of a cage-mate. Mice were housed in groups of five. At 48 hr intervals, one cohort was killed by cervical dislocation and returned to the home cage. Behavioral responses of the remaining cohorts were noted for 7 hr following each exposure. At the end of four such exposures, natural killer (NK) cell activity was measured in the remaining cohort.

Results: Fighting among the cohorts and biting carcasses were frequently observed in the C57 and AKR but not in the BALB/c mice. Lying carcasses, setting with carcasses were seen more frequently in C57. NK cell activity was significantly suppressed in C57 but not in AKR and BALB/c.

Conclusions: These results suggest that 1) the degree of psychological stress experienced following the death of a cohort differ between different haplotype strains, and 2) such behavioral changes can influence immune functions.

D.535 BEHAVIOUR MODIFICATION STRATEGY IN AIDS PREVENTION

LEWIS, RICHARD; HARRIS, CONSTANCE; AIDS Task Force, I.H.C. Hedley; SOBEL, MD, Health Education, National AIDS Program, Baltimore, BRUNELL, RALPH
Report on an experiment in Baltimore and a discussion on methodology objectives. To promote participative training models for health educators involved in AIDS prevention directed at behavioural change for specific target groups.

To establish the most effective method for each objective and target group.
Method: Theoretical background and practical experience lead to the use of participative methods by the training of health educators in Baltimore. Representatives from different target audiences were trained in information, group work and communication.

RESULTS: Experience indicates a close relationship between the training methods used and the output. Depending on the setting, the degree of personal involvement and the method procedures, changes are obtained in subsequent levels: knowledge, motivation, attitude and behaviour. For example, a lecture or an article provoked a change in knowledge while attitudinal and behavioural change lasted more or less transient. A synthetic table indicating correspondence between method and output is proposed.

CONCLUSIONS: Prevention can be made more effective when methods correspond more to the expected modifications. A differential target audience should also be used for outcome evaluation. The focus of the prevention campaign being behaviour modification, more resources are required for training of trainers, research to devise effective methods and evaluation of the outcome.

D.532 MODIFICATIONS OF AIDSOPREVA AT AN OUTPATIENT CARE UNIT IN RIO DE JANEIRO

BRAGA,
Luigi; Paulo Henrique Pinheiro; Carvalho Neto, L.O.; Sion, F.S.; Moura et al. C.A.

Caffare's Gulinie Hospital, University of Rio de Janeiro (UAC-400) - Brazil.

Objective: To study the etiology and incidence of seronegative manifestations of HIV negative individuals concerned about AIDS who came to the AIDS Outpatient Care Unit at our Hospital (seronegative states and profiles related to AIDS).

Methods: The study comprised 21 HIV negative individuals (17,084) with AIDSOPREVA selects among 130 patients interviewed, from Feb 88 to Dec 88. We performed physical examination, we used non destructive interviews, immunohistologic support and counseling.

Results: Seronegative manifestations related to the serology are shown in the following table:

Serologic And Signs	N	%
Sexual satisfaction	19	90.5
Clapnetis	15	65.2
Low concentration	10	47.6
Insomnia	10	47.6
Headache	8	38.1
Sex Alterations	3	14.3
Fever	1	4.8
Trying Suicide	1	4.8

During immunohistologic sessions it was observed that all the 21 individuals presented a pre-existing sexual conflict, basically comprising latent homosexual impulses, directed to an external object, as AIDS, a seronegative disease. **Conclusions:** A conflictive sexuality can reinforce the fear of AIDS, causing psychiatric states HIV POSITIVE manifestations that can be confused with non specific symptoms of HIV infection. AIDSOPREVA should be considered when elaborating an AIDS prevention campaign.

D.534 RELIABILITY OF DATA COLLECTED ON SEXUAL HISTORIES IN MATRIAN EMBRISMS IN BRAZIL

Molina, Eli's; Loureiro, F. M.
Genetics Health Department, Montreal General Hospital and McGill University, *Intervista de Montreal, Montreal, Quebec, Canada.

Objective: To evaluate test-retest reliability of a questionnaire on sexual histories administered to Brazilians origin.

Methods: Test-retest reliability of the questionnaire was assessed using 18 subjects (11M, 7F), aged 15-70. The median of the interval between the two qualitative administrations was at 15 days with 13.3% of intervals being 28 days or more. French illiterate subjects were asked only 14 questions related to their sexual history. The 27 most sensitive questions were self administered for French literate subjects, the other 7 questions being administered by interview. Kappa statistic was used for the estimate of reliability.

Results: All obtained kappa were significant at the p<0.0001 level. The lowest values were 0.103 and 0.737 for questions on the change of number of sexual sex and homosexual encounters. Six kappa values ranged between 0.800 and 0.900, 8 were zero to the 0.500 to 0.799 range, and perfect agreement (k=1.000) was found for 18 variables. Areas higher than 0.900 were found for: number (k=0.800), prostitute and time (k=0.800), k=0.500) of lifetime sexual partners and for frequency of condom use with these partners (k=0.800).

Conclusions: Sexual histories can reliably be obtained in the Brazilian ethnic minority of Montreal: these questions are self administered or asked orally.

D.536 THE USE OF THREE BIOPSYCHOLOGICAL INTERVENTIONS ON THE STRESS LEVELS AND MOODS FUNCTIONING OF HIV POSITIVE INDIVIDUALS

HAMILTON, Brian; CHU, J.; Duffault, Ethan; *Bellows Hospital/Community Health Project, NY, NY USA, **Smith College School of Social Work, Northampton, MA USA

Objective: On the premise that personality coping styles are a co-factor in disease prognosis, we are assessing the effects of 3 biopsychosocial interventions on the stress levels and mood functioning of HIV patients.

Methods: 10 seropositive patients underwent an intensive 16-week intervention involving Bioenergetic Psychotherapy, Meditation designed to stimulate Thyroxine gland activity & a structured Journal writing program. Each patient received a complete immune profile & biopsychosocial questionnaires at start, mid & end points with 6 month follow-up planned. Results compared to data collected from comparison group not receiving independent variable.

Results: Preliminary data suggest a trend toward enhancement of immune functioning (noting 40% correlations between overall mood profile including anxiety & depression, & most variables as cortisol and immunoglobulin levels. Therapeutic techniques used were successful in patients learning individual stress management-therefore reducing each patient's overall stress levels as measured by through assessment profiles throughout the study.

Conclusion: We anticipate finding a correlation between biopsychosocial interventions designed to promote stress reduction and positive, enhanced immune functioning. We further hope to show how these interventions can be successfully implemented in overall treatment protocols in the functioning of community-based AIDS Assessment Clinic Programs.

OCCUPATIONAL THERAPY ACTIVATION AT A MULTIDISCIPLINARY TEAM TURNED TO AIDS
MOREIRA, C.E.F.A.A.; TANNUS, L.M.N.; LIMA, M.P.J.S.; BELUCCI, S. B. B.
Centro Geriatrico. (CGCI). Campinas. São Paulo, Brazil.

CGCI a philanthropic non governmental entity, multidisciplinary composed by: doctors, psychologists, nurses, dentists, physical education teachers and occupational therapists. Research based on individual attendances of HIV infected clientele from CGCI, ambulatory, hospitable, domiciliary. The clientele belongs to differ ent risk groups at different infection stages. Their ages vary from 13 to 47. Besides the social stigma aggravation, the exacerbation of pre-existing psychological conflicts takes place, determining the Occupational Therapy activation, being the main objective the quality of life improvement, defined from emerging individual needs, like expression and communication, psychological equilibrium maintenance which results in maintenance or improvement of patients cognitive state, and life or death process acceleration. The Occupational Therapist must consider the social-political-economical and cultural context in order to avoid the restriction of therapeutic process. Results will be discussed, in the presentation.

D.545

THE BRITISH SURVEY OF SEXUAL ATTITUDES AND LIFESTYLES - A PILOT STUDY
*G.J. Field, Anne M. Johnson, **K. Wellings, C.

Hodsworth, *G.A. Wadsworth, **R. Anderson, *R.G. and a multidisciplinary team of Medicine, Health Education Authority, Gen. Merv's Hospital Medical School, Imperial College, London, U.K.

Objective: To assess the feasibility of a major national study of sexual attitudes and lifestyles in a random sample of the British population. **Method:** A stratified multi-stage sample of addresses was taken from the Postcode Address File and one person aged between 16 and 59 randomly selected from each address. Respondents were asked about numbers of sexual partners in different life periods, contraception, homosexuality, sexual practices, drug use, prostitute contact and attitudes towards sexual behaviour. Sensitive questions were contained in a self-completion booklet and completed anonymously through the interview. **Results:** From 1,095 eligible addresses, 774 productive interviews were achieved, a response rate of 67%. Preliminary analysis shows that the sample was broadly representative of the population although men were slightly under-represented. There was marked variability in numbers of sexual partners and specific sexual practices. Those in younger cohorts experienced first sexual intercourse earlier and had higher numbers of sexual partners than older cohorts. The proportion of respondents reporting homosexual experience was broadly similar to comparable European studies. **Conclusion:** Good response rates with no serious biases were achieved relative to other surveys of this nature. This pilot study has established a methodology which will be used in a national study of 20,000 individuals.

D.547

SEXUAL BEHAVIOUR AND ITS CHANGE AFTER HAVING KNOWLEDGE ABOUT AIDS
BRASILIAN UNIVERSITARY STUDENTS.
Dias, M.M.**, Adai, Francisco H.**, Goodson, P.***,
Dias, J.L. * and Vitor, A.***

* State University of Campinas, Campinas, SP, Brazil; ** The Population Council, New York, U.S.A.; *** CIBICOP, Campinas, SP, Brazil.

Objective: To assess the incidence of sexual behaviors that constitute risk of contracting AIDS among Brazilian University students and the degree of information about AIDS on this incidence.

Method: A structured questionnaire on sexual behavior and knowledge about AIDS was mailed to 2000 students of the first two grades of the State University of Campinas. Analysis was performed using SPSS PC.

Results: The percentage of respondents was 37.4%. The percentage of students not using condoms, 77.2% before knowing about AIDS, lowered to 45.6%. The incidence of oral and anal sex did not change after knowing about AIDS. The percentage of multiple partners, higher among males, was 70.5% before and 71.6% after receiving information on AIDS. Analyzing the group that had risky behaviors before, 86.5% persisted in anal sex, 56.4% not using condoms and 55.6% continued having multiple partners. **Conclusion:** Knowledge on AIDS did not modify substantially sexual behavior among students. Educational strategies appear as an urgent need.

D.544

TOWARDS IMPROVING CONDOM USE IN A SEXUALLY TRANSMITTED DISEASE CLINIC
Ridley, Jerry; Brynes, D.***

** East Orange Health Department, Newark, N.J., U.S.A.

Objective: To assess patient knowledge about condoms and spermicides in a STD and HIV infection clinic. **Method:** Twenty four patients (22 men, 2 women), mean age 25.8 ± 5.7(SD), were consecutively interviewed at an Inner City STD Clinic. Their knowledge of condoms and spermicides was evaluated through a questionnaire. **Results:** Fifteen (62%) patients knew what the average cost of condoms was. No one respondent could identify any of the spermicidal brands available on the market, also none of the patients used them. Only 2(8%) patients never used condoms, while 19 (79%) patients used condoms only occasionally. Only three patients had preference to a certain condom type. Five (21%) patients reported occasional rupture of condoms while in use. One patient reported his use of vaselins for additional lubrication. **Conclusions:** These results indicate that current counselling methods may need to be modified. One such modification is to provide each counselor with a sampler rack of the available condoms and spermicides in that particular geographic location. This would allow patients to handle each item individually in order to decide which is more appropriate for their needs. Such an approach will improve condom and spermicidal use in this population at high risk for HIV and STD infections.

D.546

THE HIV SUPPORT GROUP: AN ANALYSIS USING DIFFERENT SOCIAL PROBLEM MODELS AND DIFFERENT INSTITUTIONAL SETTINGS
Nesanel, N.D., Jerry Thomas

Bronx AIDS Community Service Project, Director of Education, N.Y.C. American Village, Inc., Health/RVY Coordinator, N.Y.C., U.S.A., Mercy College, Adjunct Professor, N.Y.C. & Bedford Hills Correctional Facility, Internship and Academic Coordinator, N.Y.C.

Objective: To analyze HIV Support Groups in relationship to five social problem models: medical, social discrimination, value conflict, deviant behavior and labelling. To analyze HIV Support Groups at five types of institutions: residential drug treatment community, methadone treatment program, the criminal justice system (local lock-up, state incarceration, the police, the courts, parole and probation), mental health facilities and general hospitals.

Method: Personal observation and study based upon years of experience. **Results:** Differences in HIV Support Groups have been according to what we used to understand them and the type of institutional setting.

Conclusion: To educate, change attitudes and change behavior, we need to consider what kind of model we use and the differences in the types of institutional settings. More study is needed in this subject.

A THREE COMPONENT AIDS ATTITUDE SCALE
Tom, Mohammed B. and Varber, A.
Indiana University, Bloomington, Indiana, U.S.A.

Objective: To plan, implement, evaluate and study AIDS education program, development of a valid knowledge test and attitude scale is essential. The purpose of this study was to develop a valid Likert-type test to assess student attitudes towards AIDS and AIDS prevention. The three-component attitude scale consisting of feeling, belief, and intention to act which is known to be an appropriate way of measuring health attitudes was utilized for the above purpose.

Method: By reviewing related literature, a table of specifications consisting of two conceptual areas was developed. A large pool of Likert-type attitude statements related to the table of specifications was developed using a variety of sources. These statements were reviewed by a jury of experts for clarity and content validity. Based on this collective analysis, a preliminary scale with 30 items was constructed. The preliminary instrument is being administered to a representative sample of 50 college students. The collected data will be subjected to Pearson correlation for criterion of internal consistency; t-test for discriminating analysis of the items and external criterion.

Results: As a result of these analyses, 15 of the most discriminating original 30 items on the preliminary instrument will be selected for the final scale. For validation purposes, the finalized scale will be administered to a representative sample of 300 college students in a major university in the United States. The collected data will be analyzed by using univariate and multivariate statistical techniques in order to evaluate scale performance, validity and reliability.

D.561 A FORMULA FOR ASSESSMENT OF INDIVIDUAL RISK ACTIVITY FOR HIV INFECTION WITH MODIFICATION FOR BEHAVIOR
Berman, Robert L., M.D., Yale University, New Haven, CT., USA

Objective. To develop a method capable of assigning a probability figure to an individual's risk of contracting AIDS, given his or her individual risk factors and sensitive behavior.

Methods. Numerous reports of clinical and epidemiological studies were analyzed to determine the lowest common denominators for risk factors involved in the spread of AIDS.

Results. The probability of an individual contracting AIDS (IRF) is the product of the probabilities of three factors: 1. the transmission efficiency of the activity (TE), 2. the prevalence of HIV in the area to which the contact belongs (AP), 3. the risk group of the contact (RG).

IRF = TE x AP x RG
 This probability can be modified by utilizing the failure probability of each protective measure taken in the encounter, i.e. condoms, testing, etc. Utilizing this formula gives results comparable to the published observation that are available, and allow for predictions when they are not.

Conclusion. The calculated individual risk probability ratio may be a valuable tool to help assess an individual's risk, and help determine the best specific preventive measures to lower his or her risk to acceptable levels for counseling and educational purposes.

D.563 ART THERAPY WITH HIV POSITIVE PATIENTS, MENDING, RESTITUTION AND HEALING
Farmer, Gill M., Art Therapy Section, Walter Reed Army Medical Center, and the Neurotic Research Group, Washington, D.C., United States of America

Objective. To present the importance and value of creative, expressive activities with HIV positive persons.

Methods. Didactic presentation and 20 minute video. The videotape features approximately 150 slides of art productions (by HIV positive military personnel) synchronized to a musical selection which match the primary emotions expressed in the art work. A poem written and read by a patient opens the slide program. One of the musical selections ("The Way We Were") is sung by a patient; others are music found meaningful by the patients themselves. The didactic presentation describes distinctive features in art work of HIV positive persons and the characteristic changes as the disease progresses. Diagnostic value of drawings to screen for major depression, psychosis, suicide risk, and competency will be outlined. Techniques found to be effective are described, with relevant hypotheses from the literature. Preliminary results using imagery followed by drawing to relieve anxiety, reduce pain, or gain insight into problems will be discussed.

Results. The presentation vividly informs how the HIV positive diagnosis and condition is experienced by patients. Effective interventions using art are presented.

Conclusion. It is important to assist patients to find some meaning for their lives, in order to regain a sense of control and self-esteem. Creative art activities allow patients to provide for their own needs for acceptance, life review, mourning and restitution.

D.565 HIV POSITIVE SUPPORT GROUPS - A MODEL OF INTERVENTION
Solomon, Kargu Rosenholtz, SJ James, RJ Santiago, D, and McLaughlin, N., NYC Department of Health, New York, N.Y., AIDS Program Services

Objective. 1. To provide group support for individuals who have tested HIV positive and their partners. 2. To provide barrier free group services to survivors who have tested positive and experience physical, emotional, and social.

Methods. The Department of Health provides professionally facilitated group services for people who tested positive and their partners and for people with AIDS. All groups run weekly and have an on-going, drop-in format. Participation is anonymous, and there are no fees or intake procedures. There is a strong emphasis on self help and leadership training. Peer support, effective communication and feedback are utilized in order to address relevant HIV issues such as safer sex, safer drug use (with an emphasis on drug free behavior) including utilization of 12 step anonymous program (e.g. AA), health promotion and maintenance, patient notification; positive attitude towards self, and control over lives and HIV status.

Conclusions. HIV support groups are effective models of intervention for those who have tested positive, particularly for those who are substance abusers and their sex partners. The groups serve as an appropriate arena to explore risky behavior including obstacles to behavior change, new and creative ideas regarding negotiating and practicing safer sex, partner notification and becoming drug free.

Results. 1. Participants have been helped to deal with the emotional crisis and transition that a positive test result precipitates.

2. Services can provide group education and information that is essential in slowing transmission and possibly progression of AIDS.

3. This model has helped to empower those who are HIV+ to become leaders of supportive groups in other settings, and has provided training for HIV counselors who wish to replicate this model. By enabling them to work with HIV+ individuals and their partners on a long term basis, groups have reduced the burden frequently observed among HIV counselors.

D.562 A TRAINING PROGRAM FOR COMMUNITY CONSULTING COUNSELING AND TESTING
Author: Rosenblatt, S., Fowley, C., Solomon, Kargu, James, R., Bantamberg, E., Schultz, S., New York City Dept. of Health, New York, NY, AIDS Program Services

Objective: To provide nurses, drug counselors, public health educators, social workers, physicians and other health and social service professionals with the skills needed for advising patients/couples about AIDS and conducting counseling related to HIV antibody testing.

Method: A consulting and testing training program was developed to help professionals overcome the barriers to talking about sex, drug, the implications of HIV disease and death. A five-day, 35-hour course, led by two trainers and limited to 12-16 participants, provides complete and up-to-date information about HIV disease, basic counseling techniques, active listening skills, and development of referral resources. The program is run according to the small group genetic model.

Results: There has been an overwhelming demand for this training. From health and other professionals working in prisons, TB and STD clinics, hospital inpatient and out-patient settings, OAS-DYN and Family planning agencies, and drug treatment programs. Requests have found the course extremely helpful, and more felt the need for additional follow-up in view of the emotional intensity of the issues and the limited clinical supervision in the small group genetic model.

Conclusions: A manual containing the complete curriculum of the five-day course has been prepared to be used by agencies in New York City and elsewhere. In addition, the training unit is planning 1/2-day follow-up sessions and 3-day second stage training programs which include case management, case management, refinement of HIV-related counseling skills, sharing of referral resources and more intensive training in such areas as addiction, death and dying and women's issues.

D.564 UTILIZING A FAMILY INTERVENTION MODEL TO PREVENT AIDS WORKER BURNOUT WITH INNER CITY PATIENTS
Walter, Gillian, The Ackerman Institute for Family Therapy, New York, New York, USA

In many large cities the majority of all new AIDS diagnoses are found in inner city families. These families present as drug using, multi-problem families, most of whom sustain more than one loss from HIV infection. The co-occurring of family problems, the stigmatization of AIDS, and the overburdening of AIDS workers negatively affect the way in which these families are perceived and worked with. Furthermore, workers are demoralized by focusing on the individual patient who inevitably dies rather than seeing AIDS as located within a living system whose future he/she can influence. In two years of consultation to pediatric and adult AIDS projects in inner city hospitals, the Ackerman AIDS team has devised a brief, problem-focused model of family intervention which allows the worker and family to concentrate on problems of survival and future planning. In this model intervention identifies family strengths and additive problem-solving capacities. Members of the extended kin system or other natural networks are identified as resources and invited to become a part of the counseling contact. As the worker comes to see the family as a resource, they become colleagues in care instead of entering into the adversarial relationship that feelings of powerlessness generate. David Reiss' illness/family research has shown that when a family can identify or utilize strengths, illness may provide an opportunity for transformation and change.

D.566 BEREAVEMENT ISSUES FOR SURVIVORS OF PERSONS WITH AIDS
Goldman, Kathleen A., Malone, D., Hospice of Central Iowa, Des Moines, Iowa, U.S.A.

Objective. To determine if survivors of a loved one who died of AIDS have a different social and emotional environment in receiving grief.

Method. Personal interview which surveyed what survivors were doing to handle their grief, what resources they had in the community and if they were accomplishing the tasks of grief.

Results. Grief tasks discussed in terms of the social and emotional environment of PWA survivors. These environmental factors appear to interfere with the resolution of three of the four tasks of grief. The results in survivors experience physical and emotional symptoms stemming from unresolved grief.

Conclusions: A structure for a therapeutic group of PWA survivors is proposed. Grief resolution is the primary goal. Specific structured exercises for facilitating the goals of each task of grief are suggested.

D.585 "IMVIT" - A PROJECT EMPLOYING FORMER IVDA'S IN HIV PREVENTIVE AND SUPPORT WORK.
Marti Inaba, Rene Ringold, Paer Nestand, Arvion Lien.
Juroun Saetved, Finn Gunnar, Dept. of Aids Prevention, Oslo City Health and Environment Department, NORWAY

OBJECTIVES: There is a need for new approaches in the HIV preventive and supportive work among drug users. This project, established by the Department of Aids Prevention in May 1987, employs, on a full time basis and with normal wages, both social workers and former IVDA's. The aim is to work out new methods utilizing the special expertise the former IVDA's have, in cooperation with professional social workers.

METHODS: - Support groups for HIV positive former IVDA's, run by a former IVDA and a social worker in cooperation. Strictly for persons not in active drug use. Some of the groups are for women only. - Support groups for active drug users. - Individual counselling. - Couple counselling. - Open doors in the day-time, with high tolerance for users under the influence of drugs. - Informal conversation, coffee. - No formal notes taken, informality and confidence stressed. - The project is being evaluated during the spring of 1989.

RESULTS: By January 1989 the project has run 7 support groups, and been in contact with 70-80 HIV positive IVDA's which constitutes approximately 40% of the known HIV positive IVDA's in the Oslo area. A qualitative evaluation of the methods used will be presented in the paper.

D.587 COCAINE USE DURING PREGNANCY: VALIDITY AND ASSOCIATIONS WITH HIV RISK BEHAVIORS
Richard J. Jansky and Ellen J.
HIV Center for Clinical Behavioral Studies, NY Psychiatric Institute and Sergievsky Center, Columbia University, New York, N.Y., U.S.A.

OBJECTIVE: To assess the validity of interview data on cocaine use during pregnancy, and associations between cocaine use and risk behaviors for HIV infection.

Methods: Over 150 women who delivered at a New York City hospital without receiving prenatal care completed a brief structured interview about their use of intravenous drugs, sexual partners at risk of HIV infection, and cocaine use shortly before delivery. The validity of self-reported cocaine use in the period immediately before delivery was evaluated against the results of a urine toxicology screen obtained from the infant at delivery. The association between HIV risk behaviors and cocaine use are studied.

Results: The sensitivity, specificity, and positive and negative predictive values of the interview data on cocaine use are presented. The odds of engaging in behaviors associated with HIV infection are compared for cocaine users and nonusers.

Conclusion: Associations between cocaine use and HIV infection may vary between populations. Within particular settings it may be important to develop means of identifying cocaine users so that they may be counseled appropriately.

D.589 DEMOGRAPHICS, DRUG USE AND SEXUAL BEHAVIOR OF INTRAVENOUS DRUG USERS (IVDU'S) WITH AIDS
Richard J. Jansky, G.R. Kahl, P.J. Palmer, C. Klein, R.S. Montefiore Medical Center, Albert Einstein College of Medicine, Bronx, New York, U.S.A.

OBJECTIVE: Before demographic, drug and sexual behavior of IVDU's with AIDS. **Methods:** Detailed standardized interview of hospitalized AIDS patients.

Results: 112 hospitalized IVDU's with AIDS participated from 10/84-1/89. Demography: male 72%, female 28%; Hispanic 49%, Black 33%, white 14%; mean race/ethnicity 68; mean age 35 years; unemployed 50%; <12 yrs education 4%; income <10,000 71%; supporting 2-3 people 23%. Drug Use: median age last IV use 17 yrs (range 11-39); 97% used IV heroin (for med and/or 9 yrs); 95% IV cocaine (median 3 yrs), 25% other drugs IV. 2 daily IV drug use 62%; "shorting hallway" use 68%; needle sharing 84% (with homosexual men 20%, family members 2%). Other drugs: alcohol 2 daily 35%, marijuana 84%, mood altering drugs 57%, stimulants 2%. Since 1978 only 31% participated in methadone Rx; 41% were incarcerated. Sexual Behavior: All sexually active since 1978; mean of 2.6 sexual partners in year before AIDS dx (median 1); sex with other IVDU 54%, with other AIDS pt 7%, male with other male 17%, female with bisexual male 12%; 17% treated payment for sex.

Conclusion: In addition to many women and poor minorities, the "first wave" of IVDU's with AIDS is characterized by teenage onset of IV drug use, subsequent prolonged, frequent IV drug use, poly substance abuse, infrequent drug treatment and co-existence of high risk drug and sex behaviors. Intervention to reduce transmission should address these complex, interrelated issues.

D.586 A COMPREHENSIVE AIDS PROGRAM IN A METHADONE TREATMENT PROGRAM
Rosa, Brian Maggi, Connolly, G. Cassidy, P.*
New Bedford Area Center for Human Services, Inc., New Bedford, Massachusetts, United States of America.

Our presentation will consist of an explanation of our methadone program and its six core components related to HIV infection. The components to be discussed are: AIDS education, HIV antibody testing, client advocacy, psychotherapy, and community and street outreach.

AIDS education is mandatory to all clients in our methadone treatment program. Three hours of education is provided within the first three months, and a minimum of one hour is provided every three months. HIV antibody testing is offered monthly on a free, voluntary, and confidential basis to all clients and significant others. This is done with pre/post counseling. Case managers can be utilized by all clients to assist with delivery of services (i.e., housing, legal, social, financial, etc.). Weekly one-hour counseling sessions are required of all clients. Within the context of these sessions, AIDS issues are continually addressed. Groups are offered for professional and support staff. Outreach workers actively educate and refer IVDU drug users to community resources. Health, condoms, and educational materials are distributed freely within the community. Our presentation will demonstrate the effectiveness of this program as it relates to knowledge, attitudes, and behavior change.

D.588 OBSERVATIONAL AND INTERVIEWS DATA ON PATTERNS OF INTRAVENOUS DRUG USE AS RELATED TO HIV-1 INFECTION
Doris J. Roney, Clifford, D.B.*, Berlin, P.C.*, Kawa, H.*, Inciardi, J., McBride, D.C.*, and Clyde B. McCoy*,
University of Miami School of Medicine, U.S.A.

Objective: To demonstrate the utility of data collected in the natural habitats of drug users for constructing intervention strategies.

Methods: In a longitudinal study of 230 street-recruited intravenous drug users (IVDU) in Miami, Florida, the investigators include direct observation of needle using behaviors and solicitation of open-ended interviews on needle using behaviors and attitudes.

Results: In "safe houses" settings, compliance with house rules shapes needle using behaviors, an enforcement of house rules are key targets for intervention to prevent HIV infection. Alternative needle practices are apparently sufficiently flexible to allow change within groups of "shooters".

Conclusion: Data resulting from these procedures provide clear guidelines for intervention but pose problems for rigorous research design. Differential influence of participants in networks of IVDUs may affect documentation studies that use random assignment strategies for testing impact of specific interventions.

D.590 SELF-REPORTED NEED FOR TREATMENT AMONG HIV DRUG ABUSERS IN AN HIV-CLINIC
Truher, Per, Johnson, P.O.** and Hagedorn, L.*
*Karolinska Institute, Department of Psychiatry, Huddinge, Sweden.
**Karolinska Institute, Department of Infectious Diseases, Karolinska Hospital, Stockholm, Sweden.

Objective: The aim of the study was to ascertain whether there is a self-experienced need for treatment of drug abuse at a HIV-clinic. **Methods:** A questionnaire was filled out according to the responses of the patients. Patients were asked about present abuse, present treatment and perceived need for treatment.

Results: After 6 months 111 questionnaires were filled out. The mean age was 33 years and 27% reported no contact with a social worker and more than half (54%) reported no present treatment of abuse. One of 117 reporting, 43% abuse heroin, 35% amphetamine, 23% alcohol, 11% benzodiazepines, 9% hashish with poly-drug abuse by 37% and 87% had intravenous drug abuse. 54% had a desire for treatment, waiting methadone treatment. In a majority of the cases (73%), rehab centers (17%), clinics and detoxification (6%).

Conclusion: This study shows that there is a significant self-reported need for treatment with a self-reported preference for methadone treatment. It is very important to improve and increase availability to specific treatment as this is of utmost importance both from individual and epidemiological point of view and necessary to prevent an extensive spread of HIV infection.

D.609 NEEDLE-SHARING PATTERNS AS A PREDICTOR OF HIV SEROPREVALENCE AMONG NEW YORK CITY INTRAVENOUS DRUG USERS (IVDU)
See: Kathleen; Brown, L. S.; Prime, S. J.; Memoio, T. A.; Foster, K. Addiction Research and Treatment Corp., New York City, USA.

Objective: To examine the association between patterns of needle-sharing and HIV seroprevalence among IVDU's in NYC.
Methods: Following informed consent, 210 patients, recruited from methadone maintenance clinics in Brooklyn and Manhattan, were administered a standardized questionnaire in 1987. This sample included 152 blacks, 471 Hispanics, and 85 whites, of which 103 were males and 642 were females. Sera were also collected and tested for HIV antibodies via ELISA and Western blot assays.

Results: The overall seroprevalence rate was 60%. Respondents who did NOT clean their needles were more apt to frequent shooting galleries ($p<0.005$). Those who frequently cleaned their needles were more likely to share needles than those who did not ($p<0.001$). Those who shared needles with the same person for at least one year were more likely to be seropositive ($p=0.062$) and less likely to use shooting galleries ($p<0.001$).
Conclusion: This information suggests that interventions directed at reducing usage of shooting galleries, at least, modifying behaviors in shooting galleries may reduce the incidences of HIV transmission associated with needle-sharing.

D.611 BEHAVIORAL RISK FACTORS OF HIGH IMMUNODEFICIENCY VIRUS (HIV) INFECTION AMONG INTRAVENOUS DRUG USERS (IVDU)
See: Memoio, T.; Brown, L.S.; Prime, S.J.; Foster, K.; Cho, A., and Ajuluobu, D. Addiction Research and Treatment Corporation, New York City, USA.

Objective: To investigate behavioral risk factors among IVDU's, especially focusing on their drug and sexual behaviors, and psychological status.
Methods: In 1986, a total 202 subjects: 162 males and 100 females; 107 blacks, 116 Hispanics, and 35 Whites, were recruited from methadone maintenance clinics in Manhattan and Brooklyn, New York City. After informed consent, a standardized questionnaire was administered by trained interviewers. Also, blood was collected and tested for HIV antibody by ELISA and Western blot techniques.
Results: The overall HIV infection rate was 61%. A significant association between age groups and HIV status was found, $p<0.05$. Frequencies of heroin and cocaine use before enrollment were positively correlated, $p<0.01$. After enrollment in the methadone treatment program, the frequencies of using heroin, cocaine, and marijuana were significantly decreased, $p<0.01$. The HIV positive subjects started using heroin significantly earlier in their age ($p<0.01$) and reported significantly larger number of needle sharing partners at shooting galleries ($p<0.02$) than those who were HIV negative.
Conclusion: Methadone maintenance programs may affectively cut the use of heroin, cocaine and marijuana. Also needed are AIDS prevention programs, focusing on younger age groups and behavioral factors, especially.

D.613 HIV INFECTION IN A SEROPRESENTIVE
See: Roberto, T. J.; Nolis R.; Giustol A.; Mey-Jehly C. For N. Service of Infectious Disease, Hospital "Germes tria e Pajol".

Objective: The greater number of IVDU who start detoxification treatment in Spain come from primary assistance programs (Autonomous Barcelona, Barcelona, Spain).
Setting: A first selection of patients tributary of anti-HIV treatment.

Methods: We included 199 heroin abusers (120 males and 79 females), with an age of 25.6 ± 4.3 years and a time of addiction of 66.4 ± 36.5 months, selected from February 27 to July 8th. We analyzed HIV serology (EIA test) and clinical search for physical signs and symptoms related to HIV infection.

Results: 116/135 (74.8%) were IDU, 28/216 (12.9%) were included in group II, 37/216 (17.1%) in group III and 51/216 (23.9%) in group IV. The greater number (40/101) of group IV were included for infectious diseases not definite as AIDS local spread and/or seroprevalence (met. 1/35) for opportunistic infections not previously known and AIDS criteria (serological confirmation).

Conclusion: We observed important clinical disorders corresponding to advanced stages of HIV infection (group III and IV) in the 75% of apparently asymptomatic patients. Efforts must be directed to this group with the aim to stoppage their drug abuse as previous step for anti-HIV treatment.

D.610 PATTERNS OF COCAINE USE AND ITS ASSOCIATION TO HIV SEROPREVALENCE AMONG INTRAVENOUS DRUG USERS (IVDU)
See: Memoio, T.; Brown, L.S.; Prime, S.J.; Cho, A.; Foster, K.; and Ajuluobu, D. Addiction Research and Treatment Corporation, New York City, USA.

Objective: To investigate patterns of cocaine use and its association to HIV infection among IVDU's.
Methods: In 1987, a total 218 participants: average age=33 years, 361 males and 642 females, and 432 blacks, 471 Hispanic, and 85 Whites, were recruited from methadone clinics in Manhattan and Brooklyn, New York City. After informed consent, a standardized questionnaire was administered by trained interviewers. Also, blood was collected and tested for HIV antibody by ELISA and Western blot techniques.

Results: The overall HIV infection rate was 60%. The HIV positive IVDU's significantly more often injected cocaine intravenously ($p<0.005$). Those often smoked cocaine ($p<0.05$) than the HIV negative. Significant intercorrelations ($p<0.01$) were found between frequencies of IV use of cocaine, heroin, and speedball (heroin and cocaine). Multivariate analysis revealed HIV positive IVDU's were older, more frequently used shooting galleries in the last 5 years, were frequently used IV heroin and cocaine, and less frequently skid-popped heroin (all, $p<0.05$).

Conclusion: IV cocaine use was significantly associated with HIV seroprevalence. Also, patterns of drug use (IV, skid popping, and smoking) were differently associated with HIV infection. Research investigating injecting behavior is needed for AIDS prevention.

D.612 'PREVALENCE OF PROSTITUTION' AMONG FEMALE HIV +VE INJECTING DRUG USERS IN GLASGOW AND THE ESTABLISHMENT OF A HEALTH CARE DROP-IN CENTRE.
See: David J Goldberg, A Thomson, ST Green, JA MacIntyre, and R. G. McDonald, CDS(U) & Infectious Diseases Unit, Ruchill Hospital, Glasgow, U.K.

Introduction: Epidemiological studies in the USA and Europe repeatedly confirm that the major risk factor determining if an individual prostitute becomes infected with HIV is not sexual activity but if they are injectors. The 'prevalence of prostitution' among IV known HIV-positive female drug injectors (DIs) (those clearly stating that they had prostituted) attending one ID hospital was found to be 57% (25/37). However, most initiatives looking at HIV-positivity among prostitutes have come across few who inject drugs; this may result from sampling purely from genouirinary medicine (GUM) clinic attenders and could lead to underestimation of seroprevalence. Concern about HIV and the paucity of health care initiatives directed towards drug injecting prostitutes led to the setting-up of a volunteer-run drop-in centre in May'88.

Methods and Results: The centre operates 3 nights weekly (10pm to 1am) in premises near Glasgow's 'red light' areas. It is advertised solely by 'word of mouth'. Referrals are made available. Health care, health education (strengthening prevention) and access to detoxification centres, GUM clinics and contraception (such as long-acting intramuscular medroxyprogesterone acetate) is provided. All women take away a quantity of condoms, including non-lubricated 'Durex Dry' (favoured by some for oral-genital sex). Up to January 1989, 71 female prostitutes had attended, the majority on several occasions. 76% of them were or had been DIs.
Conclusion: It is clear that some HIV-positive drug injectors will prostitute. Prostitutes who are DIs can be contacted through non-statutory initiatives.

D.614 COMPLIANCE OF MEDICAL FOLLOW-UP IN HIV POSITIVE PATIENTS.
See: Corine B., Blaise G., Dupin JM, Whittle RT, HIV Counselling Clinic, Regional Virus Laboratory, City Hospital, Edinburgh, Scotland, H12 6LH, U.K.

OBJECTIVE: To review medical follow-up compliance in HIV positive patients.
METHODS: The City Hospital HIV Counselling Clinic offers confidential, pre-emptive health counselling for self counselling for self counselling for self counselling as follows: injecting drug users (IDU), IDU prescribed/not prescribed

Methadone (IDU+METH), IDU no METH), homosexual/bisexuals (HB/HB), heterosexual (HT), blood and uninfected (UB). Attendance was divided into Regular (REG); Sporadic (SPO) - maximum of 3 attendances; failure to attend (FTA).

RESULTS: To date 1718 people attended (where 271 tested positive for antibodies to HIV. All were offered regular medical review.

	REGULAR (REG)	SPO	FTA	TOTAL	REGULAR (%)	SPO (%)	FTA (%)
IDU	161 (59)	109 (43)	58 (23)	328 (19)	61 (27)	70 (31)	13 (6)
SPO	56 (21)	25 (10)	31 (12)	112 (6)	24 (21)	11 (10)	17 (15)
HT	167 (62)	112 (43)	21 (8)	299 (17)	41 (14)	31 (11)	7 (3)
UB	117 (43)	100 (39)	124 (48)	341 (20)	114 (33)	114 (33)	22 (6)

CONCLUSIONS: Individuals compliance with medical follow-up (including Reg, dental, practical, and financial inaccessibility of hospital, poor public transport, non-availability of child minder, etc.). These results suggest that IDU attendance is no more than for individuals with other original risk factors.

- D.615** SAN FRANCISCO SPEEDBALLS: AN ETHNOGRAPHY OF COCAINE AND HEROIN USERS AT HIGH RISK FOR AIDS
BRUNDA, PATRICK; MARZILLI, E.; FELDMAN, H.
Youth Environment Study, Inc., San Francisco, CA, USA.

Objective. To analyze the practice of speedball (combined cocaine and heroin) use in segments of San Francisco's intravenous drug using (IVDU) population.
Methods. Interviews with active IVDUs and Community Health Outreach Workers (CHOWs), coding, analyzing and evaluating this data.
Results. Speedball use is common among IVDUs in San Francisco, particularly among older career heroin addicts. It may involve greater injection frequency than use of heroin alone. A significant portion of people on methadone maintenance continue to inject cocaine, and using a syringe to measure out two doses has been observed. All of these may put speedballers at higher risk for AIDS, in addition to needle sharing.
Conclusions. Focused ethnography can provide answers to questions about specific IVDU behaviors such as speedballing, and this is useful in designing outreach strategies to reduce the spread of AIDS.

- D.617** Support Groups for Drug Users Affected by HIV and AIDS
STANBY, DANIEL; MARSHO, RICCIO, SIVY, YOGAHTI, HANSON
MILITZ, BERNARD; BAWAKAT, A.; DRUGS EDUCATION GROUP
Terrence Higgins Trust, London, England.

Objective. To establish effective support groups in London for drug users affected by HIV/AIDS in order to reduce isolation and poor practices.
Methods. The Drugs Education Group (DEG) is a voluntary body of professionals working in the field of drug misuse which acts as an advisory group to the Terrence Higgins Trust, Europe's largest community-based AIDS organization. The DEG has initiated a number of support groups in London for current, sustained and ex-users affected by HIV. A separate group has been set up for Italian-speaking people not in contact with other drugs/AIDS agencies.
Results. All groups have highlighted the multiple problems facing drug users in deprived inner city areas: lack of access to medical/drug treatment; poverty; isolation; and poor family and peer support. Locating groups in an AIDS organization with access to medical/welfare advice and charitable funds allowed for a swift response to any of these issues. This attracted new members and enhanced the groups' abilities to support, educate and empower. All groups had a policy of not segregating current from ex-users. This did not result in relapse among drug-free members. Several people associated with the groups have "graduated" from facilitated support groups and gone on to initiate their own self-help groups such as Positive Partners and Mainline which are establishing national networks for drug users with HIV.
Conclusion. Support groups for drug users with HIV must be adequately funded and initially facilitated by experienced and motivated people. As such they can play a vital role in health education and in empowering drug users.

- D.619** OUTREACH PROGRAMS IN NORWAY - APPROPRIATE INSTRUMENTS IN NATIONAL HIV/AIDS PREVENTION AMONG DRUG USERS.
Bente Nilssen, Municipal Outreach Program, Oslo, Norway.

Recent research reports an accumulation of HIV-infection among drug users using streets and parks in Oslo city (Norway) as resorts. These groups often withhold from public care, and are not easily reached by the regular health and welfare system.
The main objectives of outreach programs are to seek out and establish contact with drug users who are in need of help and support. Reaching out to these individuals implies an invasion of their "territories". This enforces a constant development of different methods in social work to ensure the stability of the contact with drug users.
An important feature of the municipal outreach programs are the unique chance for social workers and psychologists to establish direct and long-term contact with drug users who live at the streets and are at high risk for HIV-infection and for spreading the HIV-virus.
The outreach program in Oslo provide for syringes and condoms to drug users in order to prevent the use of dirty syringes and participation in unprotected sex. This is perceived as necessary but not sufficient efforts in HIV/AIDS prevention. In the outreach programs most effort is made to bring drug users off the streets and into treatment- and rehabilitation programs to ensure more lasting behavioural changes.

- D.616** Engaging the Client with Histories of Substance Abuse or Mental Illness
BESSLER, CHARMAN; SILVA, CUTTERMAN, S.U.S.A.

Unlike many other ambulatory care settings, the AIDS Stay Treatment of the Village Nursing Home in New York City has succeeded in engaging the client with histories of substance abuse or mental illness. Success in this engagement process is due to a specific set of program policies, including an assumption that some clients may be intensively nurtured before they can pursue any self-empowerment goals such as seeking new housing, entering a drug detoxification program. Further, program policy strictly limits institutional intrusions such as lengthy intake interviews, while providing immediate crisis intervention services -- often within minutes of admission. After admission the client is encouraged to view the program staff as his family, substituting for any dysfunctional street culture, and allowing a wide influence in the client's life.
In summary, immediate responsiveness to client need appears to engage the client with histories of mental illness or substance abuse. This paper should be of interest to all clinicians and administrators working with these difficult groups.

- D.618** SWEDISH AND INTERNATIONAL SYRINGE EXCHANGE PROGRAMMES: EVALUATION AND SWEDISH RECOMMENDATIONS
Erikur Östlin, National Board of Health and Welfare, Stockholm, Sweden.

During 1983 the Swedish Board of Health and Welfare established the syringe exchange programme (SEP) in the Malmö/Land region. Available data from British SEP (Stimnet) in Amsterdam (Blomberg) is also considered in the report. The report also gives a picture of the HIV/AIDS situation in Europe. Swedish IVDA were reached by HIV as late as 1982 and the new waves varied in their infectivity due to the threat of a second wave of HIV spread among Swedish IVDA. Approx. more than 80% of Swedish IVDA have been tested, which gives good baselines for prospective epidemiological studies. Although Sweden as well as British and Amsterdam SEPs have been operating for a short time and have had methodological difficulties, the following conclusions are reached:
a) Drug abuse does not appear to have increased in project areas. Nor has any new recruitment for drug abuse been observed.
b) In the Swedish SEP area there has been no further spread of HIV during the 15-month experimental period. However, it is an open question whether this can be put down to the project.
c) Many of the drug abusers getting in touch with the SEP do not have any current therapeutic contacts. Some establish such after contact with SEP.
d) The educational motivation in the therapeutic work of drug abuse rehabilitation services has not been disrupted by SEP.
e) No drop-outs from treatment have been observed in Sweden.
f) The drug abusers themselves view the activities in a positive light (concern for health).
g) All SEP report certain declines in risk behaviour.
h) The needle exchange ratio varies between 35-100 per cent.
i) The educational opportunities generated by SEP are important.
The following problem areas are discussed in the report:
1. Congruence of drug abusers' and volunteer's views on drug use.
2. Distribution of clean tools to IVDA can be looked upon as an ambiguity at variance with a restrictive drug policy. This problem of two partly opposite goals is thoroughly discussed in the report.

- D.620** THE AIDS VANCOUVER ISLAND STREET OUTREACH PROJECT
Valerie G. Thompson Williams, Judith English,
AIDS Vancouver Island, Victoria, British Columbia, Canada.

Objectives. AIDS Vancouver Island Street Outreach Program investigated the prevalence of high risk behaviours among street youth, sex trade workers, and IVDA's on the streets of Victoria; evaluated their knowledge of and attitudes about HIV/AIDS transmission behaviours and assessed the effectiveness of the street counsellors in reducing high risk behaviours.
Methods. One hundred and one volunteer subjects (48% 15M, age range 14 to 53, 87.0%) responded orally to an AIDS knowledge/risk questionnaire.
Results. Two thirds of the subjects reported engaging in high risk behaviours (vaginal or anal sex without condoms and/or sharing uncleaned injection equipment) in the previous month, despite high knowledge scores (86% correct). The significance of the street counsellors was reflected in the 91.4% of subjects who would use them as a personal crisis support system. Subjects preferred to obtain condoms from street workers more frequently (64%) than from traditional suppliers (18%) and reported using condoms and bleach more frequently.
Conclusions. Significant high risk behaviours exist among the Victoria street youth. A high level of AIDS knowledge was not linked to behavioural risk. Preliminary evidence suggests the street counsellors may be able to reduce high risk behaviour. Future research would investigate this.

- D.627** IMPLEMENTATION AND EVALUATION OF UNIVERSAL PRECAUTIONS IN A LARGE COMMUNITY HOSPITAL
Lewison, J.; Altem, J.; Malo-Schniegal, S.; Trifantico, K.; York, E.; Cooper, B. (Hartford Hosp., Hartford, CT, USA)

Objective: To develop and test a model educational training program for the prevention of blood borne diseases in health care settings.
Methods: It has been determined that blood and body fluid precautions be consistently and universally used by health care workers (HCW) for all patients. The concept of "universal precautions" (UP) is a substantial departure from routine, established practices in hospitals and has generated confusion and inaction among HCW, administrators and educators. An educational program was developed for all HCW. Mandatory educational sessions, using video tapes, question and answer periods and a specially prepared brochure, were provided for all employees. A hospital-wide advertising campaign using posters and newsletters throughout the program. Teaching material was being evaluated by post-education tests, follow-up surveys and by direct observations of HCW on the job utilizing "check-blind" methodology. Employee needlestick occurrences and other documented exposure to blood and body fluids will be reviewed. Cost implications of UP will be determined by comparing cost after UP to standard ("disease specific") isolation procedures.
Results: The educational program and evaluation activities are in progress. Employees with difficulty most affected by UP (lab, laboratory, nursing) has refined details and enhanced acceptance. Cost estimates on UP to date exceed \$1.6 million for materials and personnel.
Conclusion: UP implementation can be expensive and disruptive, and should follow thorough planning and preparation.

- D.629** HIV/AIDS PROFESSIONAL EDUCATION: PROGRAM DEVELOPMENT AND EVALUATION FOR PHYSICIANS, NURSES AND SOCIAL WORKERS
Nurys, Patricia S.; Malady, S.; Roffice, J. and Grossman, A. New York University, New York, N.Y., U.S.A.

Objective: To develop and evaluate a comprehensive program of AIDS education for primary care physicians, nurses and social workers.
Methods: A basic core curriculum (e.g. immunology, epidemiology/etiology, opportunistic infections) was developed and has been revised by clinicians and faculty experienced in HIV/AIDS care. Modules developed focus on microbiotics, nutrition, intravenous drug use, medicine, nursing and social work disciplines. Interventions included one- and five-day workshops, conferences, seminars and a lecture series.
Results: Since 1987, over 8,000 health professionals from New York, New Jersey, Connecticut, Puerto Rico and the Virgin Islands have participated. Pre- and post-tests of knowledge, attitudes, anxiety about working with AIDS patients, and satisfaction with the educational programs were administered. Results indicated that participants demonstrated significant increases in knowledge, more positive attitudes, reduced anxiety and high levels of endorsement of the program. Findings varied by participants' prior personal and professional experiences with AIDS, and with geographic location (High/Low incidence areas) and profession.
Conclusion: This program has effectively reached a significant number of health professionals in an area of high AIDS prevalence. It has been favorably received and has impacted on professional behavior. Geographic location, as a factor in the level of education needed to maintain HIV expertise, needs further exploration.

- D.631** DEVELOPMENT AND RESULTS OF A NEEDS ASSESSMENT SURVEY FOR HEALTH CARE PROFESSIONALS AT A HOSPITAL HOSPITAL.
Agnaf, Rajkumar, R.; Gendler, J. and El-Sher, M. A. *Marlin Hospital Center, New York, N.Y., U.S.A.

Objective: To determine attitudinal and/or cultural factors that influence the care administered to HIV-infected patients. This was of particular interest since the HIV-infected population at this institution primarily consists of intravenous drug users (IVDU) and of minorities.
Methods: Informally identified professionals at this institution primarily consisted of patients were stigmatized by the risk factors that cause the disease. As a result of these discussions, we decided to formally assess the attitudes of the health care givers and base our educational approaches on the results. Incorporated into the survey were questions to determine what areas they wanted to learn more about, including behaviors and psychodynamics of homosexuality and I.V. drug abuse. We also included questions regarding the ethnicity of the medical house staff/nursing staff in order to determine if cultural and societal attitudes were influencing attitudes towards the AIDS patients.
Results: The survey was pre-tested among a group of doctors and nurses who cared for the most AIDS patients before implementation. The results of the pre-test indicate strong feelings about the personality and behavior of the IVDU that negatively affected care.
Conclusion: The full results of the survey among medical house staff and nursing staff will be presented.

- D.628** ESTIMATED RISK OF HIV INFECTION AMONG SURGEONS PRACTICING IN THE NEW YORK CITY AREA.
Murray, G.J.; Chiu, S.; and Lowenthal, A.B. New York Medical College, Valhalla, New York, USA.

Objective: To estimate the occupational risk of HIV infection in surgeons.
Methods: Surveys from several hospitals in the New York City area were surveyed by telephone or by mail between July and October 1988 regarding puncture wound injuries occurring within the past 1 year.
Results: 100 (81%) of 110 surgeons contacted by phone and 102 (53%) of 191 contacted by mail agreed to participate. Since there were no significant differences in responses of the 2 groups, the data were combined. 177 (84%) reported at least 1 puncture injury within the past 12 months, with a median of 2 injuries per year. 76% of injuries occurred during surgery with a median injury rate of 4.1/1000 operating room hours. 53% of all injuries involved the index finger of the non-dominant hand. Injury rates were independent of age, sex, type of practice, operative work load, or type of hospital.
Conclusions: If the prevalence of HIV infection in surgical patients is 5% and if the rate of HIV seroconversion per puncture injury is 0.43%, then the average exposure to 30 year cumulative risk of HIV seroconversion per surgeon is 1-2%. This risk could be reduced by approximately 50% if an apparatus were developed to protect just the index finger.

- D.630** USING LEARNING GOALS TO TRAIN HEALTH CARE WORKERS ON

James, Gary
*University of Illinois at Chicago, Chicago, Illinois, U.S.A.

Objective: To help trainers improve health care workers learning in three domains: cognitive, attitude and skills.
Methods: Analyze five observations of over 30 training programs conducted between 1985 and 1988 for multi-discipline health care workers. Program (experiential exercises and small group discussions) were conducted in community settings and health care facilities. Observations included participants' and conductors' comments and written evaluations of training programs.
Results: COGNITIVE LEARNING: 1) "What is believable?" (Health information from credible sources. Acknowledge the unknown. Stress the consistency of use and existing information, development of expanded knowledge base. 2) "How much occupational risk is there?" (Inform on research of HIV exposure vs. infection, compare to other diseases and other risks HIV accept. ATTITUDE: 1) "This disease is scary." Acknowledge fears and concerns of HIV and their families before trying to change them. 2) "People who get HIV are bad people." Challenge personal biases, promote tolerance for differences. 3) "It's not my responsibility to work with these people." Develop and/or reinforce professional ethics. 4) "They can't change their behavior." Reinforce belief in ability of people to change; HIV can adopt universal precautions, change attitudes; persons can change their behaviors. 5) "People like me don't get HIV." Identify and acknowledge HIV personal risk. 6) "This is depressing." Convey hope in scientific research, explore potential of disease to transfuse patients and HIV, reinforce acceptance of HIV's status and spiritual needs. 7) "I don't have it." Reinforce ability of HIV with testing, emphasize adoption of universal precautions, identify relevance of prior skills, provide role models. CONCLUSION: Research is needed to substantiate the community of these learning issues and the value of techniques to provide their resolution.

- D.632** SOURCES OF STRESS AMONG AIDS CAREGIVERS
Mandil, Jeffrey E.; Gendler, J. and El-Sher, M. A. *University of California at San Francisco, Schools of Medicine and Nursing, California, USA;
*Young Adult's Institute, New York, New York, USA.

Objective: To determine common sources of stress among AIDS caregivers.
Methods: Participants in "care for the caregiver" workshops were surveyed by self-administered questionnaire to identify sources of perceived stress in the provision of AIDS care.
Results: Although a wide range of health care providers were targeted by these workshops, physicians chose less frequently than did nurses and mental health professionals to attend. Most commonly cited sources of stress were (1) organizational problems; (2) lack of resources; (3) loss of friends/loved ones; (4) distress associated with death and dying; (5) inability to set limits on work; (6) overidentification with patients; and (7) feelings of helplessness/inadequacy.
Conclusions: AIDS caregivers experience in common several sources of stress in their work. Limitations in organizations' capabilities of responding to the needs of the AIDS crisis are perceived to be as stressful as the emotional demands of patient care.

AIDS and the Individual

- D.639** CARE FOR THE CAREGIVERS - A TRAINING MODEL
 Jacobs, Raymond, Lewis, A., Mandel, J.,
 Yodanis, C. Institute, New York, R.; ** University of
 California, San Francisco, Schools of Medicine and Nursing, U.S.A.

Objective. To develop an educational vehicle which addresses the stress experienced by those who provide AIDS care over time.
Methods. Simple techniques in recreational and drama therapy have been integrated into a workshop format. These techniques are used to facilitate discussions among participants focusing on feelings of sadness and exhaustion, as well as inherent rewards that are related to the AIDS crisis.
Results. A two hour didactic and experiential, insight-oriented workshop which addresses the psychological needs of health care providers who work in AIDS has been developed and used with over 1,000 participants in eight countries. During the course of the workshop, providers learn to recognize sources of stress as well as acknowledge rewards in their work. Participants are able to use these methods and techniques as well as adapt the model from the perspective of their own training and discipline for use in their own professional and paraprofessional settings.
Conclusion. On-going support and care for AIDS caregivers is vital to the process of reaffirmation, commitment to work, and work productivity, in AIDS service delivery systems.

- D.641** UTILIZING MEDICAL STUDENTS IN A UNIVERSITY-BASED COMPREHENSIVE AIDS EDUCATION AND COUNSELING PROGRAM
 Copple, A. Gene*, Schaffner, W. J., Sheets, R., Lindsay, L.,
 Nixon, L.,** and ***
 *Vanderbilt University, Nashville, Tennessee, USA; **University of South Florida, Tampa, Florida, USA; ***University of South Carolina, Columbia, South Carolina, USA

Objective. To successfully involve medical students in the delivery of AIDS/HIV educational and counseling services as part of the academic program.
Methods. First, second, and fourth year medical students at Vanderbilt Medical School were enrolled in the elective course, AIDS Education and Prevention. This course is coordinated through the Vanderbilt AIDS Project and involves a two-day intensive seminar, weekly supervision sessions, and bibliography. The practice section includes curriculum development, providing education programs, and working with symptomatic HIV clients. Course content includes epidemiology, medical and psychosocial aspects of HIV infection, legal and ethical concerns, human sexuality, and counseling and education methods.
Results. 100 medical students have participated in this program since 1985. Student evaluations indicate the program has increased their knowledge of AIDS/HIV, human sexuality, and psychosocial issues. The program has also provided them with practical counseling and patient education methods which will be of value in later practice.
Conclusion. Medical students should be provided with an opportunity to participate in AIDS education and counseling as part of their academic program. Such courses should be focused on practice issues and well supervised.

- D.643** AIDS EDUCATION AND TRAINING FOR HEALTH CARE PROVIDERS IN VIRGINIA
 Hamilton, Lisa*, Bradford, J., and Lewent, L.,
 Medical College of Virginia-Virginia Commonwealth University,
 Richmond, Virginia, United States.

Objective. To plan, implement, and evaluate a program of AIDS education and clinical training tailored to the needs of health care providers throughout Virginia.
Methods. Through cooperation with the Virginia Department of Health and the Mid-Atlantic AIDS National Education and Training Center, a multidisciplinary team of trainers and experts in the care of HIV-infected patients was organized with specialties in infectious disease, psychiatry, social work, substance abuse, nursing, counseling, dentistry, dietetics, epidemiology, and pediatrics. Outreach, publicity, and program planning was accomplished with the assistance of professional organizations and state hospital associations. Free educational programming is available to physicians, counselors, social workers, nurses, prehospital care providers, support staffs, funeral directors, and students in all health fields. A comprehensive baseline needs assessment encompassing knowledge, beliefs, and attitudes was completed by the University's Survey Research Laboratory for physicians, dentists, counselors, nurses, emergency care workers and funeral directors.
Results. Between Jan. 1, 1987, and Dec. 31, 1988, over 15,000 health care workers in Virginia received AIDS education and training tailored to their individual areas of interest and level of need. Serial surveys are planned on a biannual basis to evaluate the effectiveness of the educational intervention, identify program changes needed, and develop target objectives for subsequent years.
Conclusion. A comprehensive AIDS education program can address the needs of health care workers from a wide range of fields. When combined with ongoing needs assessments and evaluation, such a program can be modified to address specific educational needs as these change over time.

- D.640** IMPROVING THE SKILLS OF HEALTH CARE PROVIDERS WHO TEACH
 Doumar, Ann*, Chapman, L.; Kaetz, S.; Mandel, L.*
 *University of Washington, WAH AIDS Education and Training
 Center Program, Seattle, WA.; USA

The University of Washington AIDS Education and Training Center Program (AIDS ETC) was established in 1987 to prepare health care workers to teach others about HIV/AIDS. In addition to content on HIV/AIDS, the program offers instruction using the AIDS TEACHING SKILLS CURRICULUM. This curriculum includes chapters on Creating a Climate for Learning, Curriculum Design and Planning, Teaching Methods, Preparing Visual Aids, Recognizing and Responding to Resistance, Leadership and Training Styles, and Delivery. Each chapter contains lecture material, visual aids and suggested learning activities, each designed to prepare participants to provide effective HIV/AIDS instruction to health care professionals. Approximately one-half of the week-long course is devoted to the AIDS TEACHING SKILLS CURRICULUM and teaching concepts. To date, 250 providers have attended. Examination of the instructor training course is underway. The curriculum package and evaluation results will be displayed during the poster session.

- D.642** RELUCTANCE OF HEALTH CARE WORKERS TO TREAT AIDS PATIENTS - AN ANALYSIS
 Curry, Charles*, Ogden, B.; Johnson, M.P.,
 University of Florida, Gainesville, Florida, USA

Objective. To evaluate association between willingness to work with AIDS patients and knowledge of how AIDS is transmitted, ethical beliefs, and fear of contagion.
Methods. Ninety health professionals were surveyed about their willingness to work with AIDS, their attitudes towards AIDS related ethical issues, and understanding of AIDS epidemiology.
Results: 34.4% of respondents expressed reluctance to work with AIDS patients. This was significantly associated with a belief that working with AIDS increased risk for the disease, a belief that health professionals should have the right to refuse to work with AIDS patients, and an unwillingness to treat homosexuals and J.V. drug abusers. No significant differences were noted between those willing and unwilling to treat AIDS patients with regards to professional status, demographics, understanding of how AIDS is transmitted, compassion for AIDS patients, or agreement with certain basic principles of medical ethics.
Conclusion: Reluctance to treat AIDS appears to be based on irrational fears of contagion rather than ignorance about the epidemiology of the disease or a lack of ethics. AIDS education of health professionals should include strategies to reduce fear and to humanize the AIDS patient.

- D.644** ANALYSE DES COMPORTEMENTS BIOLOGIQUES ET MEDICAUX FACE A LA RELATION SEROPOSITIVITE TOXICOMANIE (ENQUETE DANS LA REGION ILE DE FRANCE)
 Maudin, Claude*, Neumann, C.; Halaud, P.; Labadie, D.; Robin, C.,
 Paris, C.,**

**Association HIV Hôpital de Bigny, 91640, FRANCIS. **DASS ERYV 91000, FRANCE
Objective. Analyser au niveau du Département de l'Essonne, l'implication des Fraticiens dans l'accueil et le suivi des sujets HIV séropositifs et toxico manes. Proposer des solutions aux problèmes rencontrés par nos confrères.
Methods. Association HIV 91 en place le 15 Décembre 88, grâces à une subvention du Ministère de la Santé et à la collaboration de la Direction Départementale de l'Action Sanitaire et Sociale, une enquête adressée aux 2992 Confrères (Médecins et biologistes) de l'Essonne. Un système de gestion de données type 3base (PC compatible II, disque dur File Card 30 Mo western) permet d'évaluer des filières de soins médicaux et d'apprécier les problèmes rencontrés avec les toxicomanes.
Results. Le taux global des réponses est élevé (45 %). Pour le questionnaire Médical 65 % des généralistes et 35 % des spécialistes ont répondu. Parmi eux 45 % suivent des Fraticiens, 30 % des toxicomanes. La fuite du malade et les pathologies intercurrentes sont les difficultés majeures. Pour le questionnaire Biologique 1/4 ne sont pas concernés, 30 % pratiquent le dépistage four positif et le dialogue avec le patient. Une lettre d'informations, Régulière, est soumise par la majorité des Fraticiens.
Conclusion. Une lettre d'informations et des équipes de soins confirmer la nécessité de mettre en oeuvre une action associative et pluridisciplinaire.

- D.645** MULTIDISCIPLINARY AIDS TEAM ROLE IN NORMALE AND STRESS REDUCTION AMONG HEALTH CARE WORKERS (HOW)
Rabin, M.; O'Neil, R. A.; Collins, K.; Friedland, G.R.; Gordon, L.; Klein, B.S.; et al. Montefiore Medical Center, Albert Einstein College of Medicine, Bronx, New York, U.S.A.

Objective. To describe a multidisciplinary team's role in maintaining morale and reducing stress among AIDS HOWs.

Description. Complexity of AIDS clinical care requires expertise from many disciplines and is associated with HIGH stress. Stressors include: cruelty of AIDS, youth of patients(pts), inadequate social and family resources, issues of confidentiality, discrimination, discomfort with patient life styles, ethical dilemmas, death and dying, unrealistic expectations, fear of infection, sense of isolation, and lack of resources.

Over the past 6 yrs, a multidisciplinary team, initially formed to provide pt care, has functioned to reduce stress and provide support for HOWs. The core team consists of MDs, RNs, RMs joined by psychiatrist, nutritionist, lawyers, and clergy. Functions include: 1. creation of group identity 2. stable leadership 3. frequent meetings to educate, foster trust, optimism, cooperation and communication 4. allow expression of feelings including grief 5. promote cross cultural awareness 6. support research and attendance at professional meetings to enhance personal growth and sense of achievement 7. essential services for patients 8. social events to promote cohesiveness 9. permission to care for oneself as priority.

Conclusion. An AIDS clinical care team can enhance staff morale and reduce stress by formal and informal group mechanisms, but requires commitment to team building and maintenance from the onset.

- D.647** AIDS A HEALTH CARE GIVER'S KNOWLEDGE, ATTITUDES AND INFECTION CONTROL PRACTICES
Katz, J., Fendley, J., McCann, C and Addy, C.
University of South Carolina School of Public Health, Columbia, South Carolina, USA

Objective. To determine the knowledge, attitudes and infection control practices among health care givers.

Methods. 241 health care givers, consisting of registered nurses, licensed practical nurses, nursing assistants and technicians, medical technologists and phlebotomists, responded to an AIDS survey in a South Carolina hospital. Scores for knowledge, attitudes and infection control practices were calculated. Data were analyzed using stepwise regression - one-way ANOVA and Tukey's multiple comparison procedure.

Results. In general, knowledge about AIDS appears to be high among these health care givers. However, they still have fear and increased risk perception concerning AIDS. 32 to 72% of the various study groups believed that they can get AIDS by taking care of AIDS patients. Over 60% of the respondents reported that they would prefer to avoid caring for people with AIDS. Only 51 to 64% of the participants wear gloves at all times.

Conclusions. Although health care givers in this study were quite knowledgeable about AIDS, they exhibited fears and increased perceived risk of acquiring HIV infection. A substantial number did not follow the universal precautions recommended by C.D.C..

- D.649** SUPPORT FOR STAFF ADDRESSING HIV/AIDS ISSUES IN A DRUG REHABILITATION CENTRE.
KEY: Burgess, King's College Hospital, London, U.K.

Objective. To enable staff at a drug rehabilitation centre to identify sources of stress arising from their treatment of clients with HIV/AIDS and to generate management solutions.

Methods. A facilitated support group was set up for all staff, many of whom are themselves management. Eighteen meetings were held over a six month period.

Results. The principal causes of stress were found to be:

- (1) ORGANISATIONAL - poor communications; unneeded operational policies.
- (2) CLINICAL - relating HIV to drug abuse; the need to address death; loss of ability to reassure clients about better health after drugs.
- (3) INDIVIDUAL - feeling de-skilled; fear of infection; feeling isolated; quiet over own past drug use.

Solutions included setting up formal and informal forums to ventilate problems. Attempts were also made to clarify staff roles. A training programme was implemented, both to provide clinical updates and to address counselling issues surrounding death. As a result of the group, staff reported feeling better able to acknowledge and control stress.

Conclusion: Staff support groups can be seen as useful forums for problem solving.

- D.646**

D.646 HIV EXPOSED HEALTH CARE WORKERS AT MSKCC
Carron, Melaine J.; Campbell, S.N.; Blevins, A.; Sobock, K.A.; Wolf, J.R.M. and Armstrong, D.
Memorial Sloan-Kettering Cancer Center, New York, New York, U.S.A.

Objective. To examine compliance of Health Care Workers (HCW) to CDC guidelines for significant exposure (SE) to HIV infected patients.

Methods. All HCW reporting significant exposures (needlestick or mucous membrane) to employee health service between June 1986 and December 1988 were referred to an Infectious Disease nurse for interview and follow-up.

Results. Of the 46 referred 11 refused any follow-up, 20 continued follow-up for one year, 25 reported HIV testing, all were negative. The total number of reported SE including known HIV exposures was 416. He suspect under-reporting of all SE including those involving patients with HIV infection.

Conclusion. Fewer than one-half of HCW who report SE comply with follow-up. Reasons may include: concern for lack of confidentiality, inconvenience, knowledge deficit, and fear of results. A need for education about risks of needlessticks and methods of reducing the number of occurrences is seen. Concerns about confidentiality need to be addressed.

- D.650** NEEDS ASSESSMENT OF STAFF AIDS EDUCATION PROGRAM IN TERTIARY CARE AND INNER CITY COMMUNITY HOSPITAL
Leffels-Greulich, Pearl; Foley, M; Walther, V; Rothenberg, A; MAFAS, M; and EPSTEIN, I.
Mount Sinai School of Medicine, New York, NY, U.S.A.

Objective. To develop an AIDS staff education program in 2 hospitals serving East Harlem, an inner city community: Mount Sinai Hospital, a tertiary care center and North General Hospital, a minority-run community hospital.

Methods. A comprehensive needs assessment was performed at both sites by 2 AIDS Education Coordinators through interviews of staff in selected hospital areas, which serve the targeted high risk population, women of childbearing age. A broad spectrum of health care providers and workers were interviewed ranging from physicians and nurses to social workers and clerks.

Results: Greater than 200 staff were interviewed. Despite more extensive pre-HIV staff training in the tertiary care center, gaps in basic AIDS knowledge were found. Most staff were concerned about their risk of AIDS transmission regardless of their knowledge level. With the stress of working with high risk patients and with the changing role of staff toward education and counseling, there was a great need identified for ongoing staff support. The need for linkages with other AIDS education activities in the hospital and community was noted.

Conclusion. An effective AIDS staff education program requires intensive planning and must be responsive to documented staff needs. Staff knowledge should not be overestimated, and training must go beyond information to staff support. The curriculum will be organized in modules and will be customized to the needs of the particular staff of each hospital area. (This effort was funded by the Alfred P. Sloan Foundation).

D.651

A SUPPORT GROUP CAN HELP PRIMARY CAREGIVERS FACE UP TO THE INCREASING IMPACT OF THE HIV EPIDEMIC

Abstract: Harvey, D.S., Frost, J.C.***; Judd, D.; Lee, S.P.; O'Neill, L. HealthCare Associates and the Departments of Medicine, Social Work and Psychiatry, Beth Israel Hospital/Harvard Medical School, Boston, MA. Center for Studies of the Harvard AIDS Institute at Harvard School of Public Health. **The Boston Institute for Psychotherapy, Boston, MA, USA.

Objective: To describe a multidisciplinary support group of health care providers working with people with AIDS in a primary care group practice within a general medical hospital.

Method: A 15 member group of clinical and administrative personnel met with a mental health group facilitator for 15 weeks. The members discussed their personal experiences with HIV infected patients presently in their caseload.

Results: Sessions included both educational and emotional content, focusing upon both personal and professional concerns such as: feelings about and lack of knowledge regarding alternative lifestyles, IV drug use, or cultural differences; ethical and moral concerns raised by treatment decisions; the impact of the rapid growth of information and technology; and their feelings about caring for people their own age or younger with a terminal illness.

Conclusions: Caregivers who had previously felt isolated, overwhelmed by their experience, and worried about the impact of their own emotional experiences expressed feelings of greater support and community, and an increased interest and capacity to care for people with HIV infection.

D.653

EFFECTS OF HIV AND AIDS WORK ON STAFF EMPLOYED IN CARE
A. Clark, S. Werry, J. Hopkins/Infection Institute & George
St Mary's, London, U.K.

Introduction - Staff stress and burnout has been documented. HIV involves health care staff in servicing, caring, counselling and high intensity care. This study assessed the impact on staff, how they cope and to see if coping styles and avenues were predictive of adjustment to stress.

Method - Twenty one staff from front line work in the area of highest incidence in London completed the study investigation. Mean age was 28.6 yrs (range 23-40). Mean work with AIDS/HIV was 16.1 mths. Mean years of qualification was 8.3 years. Staff rated current stress, coping avenues and perceived and experienced stressors.

Results - No subjects were untrained - 29% fairly, 35% moderately and 35% very. All subjects found it desirable to separate work and outside life, yet one fifth were not very effective at doing this. No subjects turned to groups outside the hospital for support. This has important implications for service provision. Low stress subjects attended educational courses whereas high stress subjects did not (mainly used informal support). Emotional courses may provide stress inoculation or may be the choice of support for low stress subjects. Information is a key tool in this area and such groups may be ways of equipping staff or provide a forum for informal networks. Stressors were varied. Although they were associated with the death of a patient and ill patients and relatives, a considerable proportion of stressors were associated with interpersonal and practical issues which could easily be addressed.

D.655

FACTUAL INFORMATION AND A GOOD WAY TO CONTRIBUTE
TO REALISE CARE OBJECTIVES (HOM) EDUCATION
J. Babin, J. Thibaut, J. Félou, J. J. Rimeux, G. J.
Bertoni, J. Boland, J.M. and Renaud, H.
CHU - Sart Tilman, State University of Liège, BELGIUM.

OBJECTIVE: Working with AIDS can induce stress, anxiety and overlook as well as intellectual stimulation. This psychological impact could be linked to the lifestyles associated with AIDS, distress over the youth of the patients, neurological complications and dying patients. Also, individual assessment of HOM remained still anxious about the risk of a nosocomial HIV contamination. It will be interesting to give information about AIDS and lifestyles related to AIDS in order to facilitate the contacts of HOM with patients and, also, to give directives in order to minimize the risk of HIV contamination during professional activity.

RESULTS: Manuscripts with recommendations were provided. However, conclusions were not sufficiently modified. Therefore, on the occasion of the World AIDS Day, we delivered a pictorial information.

CONCLUSIONS: For the first time, we were requested to materials and attitudes regarding AIDS patients.

CONCLUSIONS: Specific informations to HOM are needed to reduce staff's discomfort and to facilitate their work. Specified practical recommendations contribute to a better sense of security. A pictorial information is more attractive than a manuscript and could be a good way to reach this goal.

D.652

DEMI DE LA BEAUTE ET FORMATION DES PROFESSIONNELS DE SANTE
MILHAUD METTETAL - FROBER EUGEMANN - M BARRY - ALFORD
NAPRIAN - ACAT - GALDRES - ACAT - SGAURS - ** ACAT - SGA - FRANCE

Objectif: Analyser dans le cadre de la réhabilitation par le profession de santé les besoins de formation des professionnels de santé. Méthode: enquêtes statistiques des demandes d'information, évaluation des demandes de formation, évaluation de compétences et connaissances des stagiaires en cours de formation, questionnaires.

Resultats:

1) Le rôle de la réhabilitation du patient par le profession de santé est exactement l'attente de la population générale et les évolutions de la corps médical, ce qui est en rapport avec le rôle du professionnel de santé, et une connaissance sérieuse de la maladie, et un meilleur comportement psychologique, et le respect qui très souvent le comporte des situations difficiles à vivre être confronté.

2) Le rôle du corps médical de la population générale, est l'impact de la situation médicale, mais le statut de travail et médecin le conduit à résoudre son problème pour lui-même sans prendre en compte le rôle du patient, et de la famille, et de la personne à faire face avec ses connaissances, sentiment que les traitements ont des effets sur le corps médical par le profession de santé.

3) Le rôle de la famille dans le profession de santé est proportionnel au manque de formation spécifique au problème de santé, et surtout l'absence de connaissances médicales et l'absence de la "grande" presse médicale, surtout au niveau des soins, les conférences ne traitent pas certaines lacunes scientifiques et traitement pas le stress psychologique, la formation continue ne prend pas en compte les problèmes sociaux, pratiques, évaluer correctement par les médecins, les stages médicaux sont encore conduits sur le mode de l'attribution libre, et la technique clinique traditionnelle et psychologique et le vécu.

Conclusion: Seule une conception globale de la formation, intégrant tous les paramètres à long les besoins, et satisfaisant la demande du public général pourra une situation de rupture dans les années à venir.

D.654

COOPERATION BETWEEN PHYSICIAN AND PSYCHOLOGIST:
AIDS - A CALL FOR FREEDOM-ORIENTED SOCIAL TEACHING

Leiberman, R.^{1,2}; Narasim, C.^{1,2}; Palmer, J.²; Porush, U.²; Rosenbaum, M.⁴; Ulich, R.³

University of Erlangen, ¹Medical Clinic III, ²Medical Clinic III/Dept. of Psychology I, ³HIV/AIDS-Center of Federal Health Administration, Berlin, ⁴USA.

Objective: To describe several ways of cooperation between physicians and psychologists caring for HIV-seropositive persons and AIDS-patients.

Methods: 100 physicians and psychologists completed an inventory asking (1) for their experiences with HIV-positive persons and (2) their expectations of the other profession.

Results: 40% of the psychologists and 90% of the physicians had experiences with the treatment of HIV/AIDS-patients. No significant differences were found in both groups' judgements of the importance of counselling patients with regard to their life style, informing them about their prognosis, and teaching them relaxation techniques. Physicians endeavored to talk extensively with their patients, they recognized, however, their own lack in techniques of counselling and psychotherapeutic intervention. Major tasks for psychologists, therefore, would be the training of physicians and other professionals, supervising a/c. them-outreach or helpline groups, offering relaxation and medication courses, and developing psychotherapeutic intervention programs.

Conclusion: HIV/AIDS-patients need special psychosocial care: new forms of cooperation between professionals must be developed in order to minimize stress.

D.656

PSYCHOLOGICAL STRAINS IN A MULTIDISCIPLINARY
TEAM TAKING CARE OF AIDS PATIENTS IN BRAZIL
Eduarda Alencar, G. Guatior, et al.

School of Medicine, Federal University of Rio de Janeiro, Brazil

Objective: To identify and work through, by an experience in group dynamics, the anxieties and conflict tensions felt by a health team treating AIDS patients. **Method:** Investigation was done through the structure of the multidisciplinary team dealing with the group dynamics. Weekly meetings with the research subjects (AIDS, dentist, nurse, nutritionist, social workers), were conducted by two dynamically oriented psychiatrists for one year in a university hospital. All meetings were recorded and an interpretative reading was done.

Results: The anxieties more frequently seen in the group were generated by the therapeutic alliance dealing with transgressive behavior of the patients associated with sexuality and drug addiction, and the fear of contamination. The anxieties identified in the group were shared by the different subjects, and provided the elaboration of more adequate defenses.

Conclusion: AIDS associated death, anxiety, and transgression behavior, intensifies conflict tensions in patient care. The limitation of medical knowledge makes multidisciplinary approach a must in AIDS. The group work was a valid instrument to identify and work on anxieties of health team, to develop the psychotherapeutic function, and to improve integration among the health team.

- D.663** **ASSESSING THE IMPACT OF AIDS INTERVENTION PROJECTS**
 Erickson, Barbara and Williamson, Nancy K.*
 *Family Health International, Research Triangle Park, NC, USA.
 Evaluating projects designed to encourage people to engage in behaviors that reduce the risk of AIDS is fairly straightforward. This is not the case if project is designed to prevent HIV transmission. For example, having a control group might make sense scientifically in order to assess what might have occurred without the program, but rarely is this practical with AIDS projects and may consider it to be unethical.
- If incidence is low in the target population, there may be too few cases of transmission over a project's duration to measure its effectiveness. In this instance, multiple indicators can be used, including incidence of other STDs, practice of safe sex or other desirable behaviors, and knowledge and attitudes. If the prevalence is high, there may be little opportunity for the program to have an impact on the infected group. In that intervention may significantly reduce transmission to sexual partners.
- If the focus is on individuals with high risk behaviors (often the most cost-effective public health approach), it may be hard to reach individuals who do not identify themselves as being at risk or do not frequent places where programs can be implemented. Follow up is also difficult especially if the target populations are highly mobile (commercial sex workers, IV drug users, and transportation workers). Finally, it is difficult to ascertain whether participants are practicing safer behaviors. This paper gives examples of these problems and proposed solutions based on planned and ongoing AIDS programs in Africa, Latin America, and Asia.

- D.665** **MARRIAGE, STD AND PROTECTION FROM HIV**
 Clark, Robert P.* and Nahn, Anita C.*
 *U of South Florida, Tampa, FL **US Clinic, Amnsh, Germany
 As the realization that the AIDS epidemic is unlikely to be controlled anytime soon by either a vaccine or a drug treatment, interest in social behaviors that reduce STD rates has increased. The most acceptable sexual behavior occurs with seropositivity, and the relative absence of marriage in the young sexually active black subculture is cited as a contributing cause to the high rate of HIV seropositivity (twice the white rate as shown in the US Military recruit data). US Army studies of syphilis rates done prior to World War II, before the introduction of penicillin, showed that marriage had a protective effect against syphilis.
- To examine the possibility that marriage might serve as a protection against STD's and therefore against infection with HIV, a pilot survey was conducted among US Military personnel. The analysis showed a significant difference between the white enlisted married rate of STD's of 13% and the black enlisted married rate of STD's of 35%, and no significant difference of the latter from black enlisted unmarried rate of STD's of 30%.
- Blacks, married or single, engaged in more risky sexual behaviors than did married whites. This preliminary study suggests that marriage as an institution may not be protective against HIV infection, and that fundamental sexual issues must be addressed with all members of a minority.
- It is of interest to note that in this age of antibiotics and health consciousness, 13% of these white married males have had an STD and must also be considered candidates for HIV infection. Only 30% of white married males met the Judeo-Christian ideal of monogamy.

- D.667** **FOCUS GROUPS AS AN EDUCATIONAL INTERVENTION FOR BLACK GAY MEN**
 Hollinger, George, Jr.* Nays, V. K.,** and Cochran, S.D.**
 *Black C.A.R.E. Project, Los Angeles, United States
 **University of California, Los Angeles, California, United States
 **California State University, Northridge, California, United States
- Objective:** In order to develop effective strategies for AIDS education and prevention efforts with Black gay and bisexual men, information was gathered from diverse groups across the United States.
- Methods:** Six focus groups of 2-5 hours in length, each composed of 8-10 Black gay and bisexual men were conducted in New York, Chicago, Los Angeles, Atlanta, Omaha, and Pittsburgh. Methodology based on marketing and group dynamics was used to assess relevant factors, including language, level of knowledge and culture, involvement in HIV-related behavior.
- Results:** While the initial purpose of the focus groups was to assess information from the subjects, the impact was that of an educational intervention. Participants reported a desire to continue in a group format and to organize similar types of groups. Individuals personally reluctant to become involved in AIDS-related activities appeared motivated to participate because 1) the facilitator did not reside in their city and 2) networks used to organize the groups were so diverse that most members knew few if any of the other participants.
- Conclusion:** Focus groups appear to be a potential model for increasing participation by Black gay and bisexual men in AIDS-related risk reduction.

- D.664** **FACTORS INFLUENCING AIDS RISK PERCEPTION OF BLACK GAY MEN**
 Bush, Jackie B.* Cochran, S.D.** and George Hollinger, Jr.*
 *University of California, Los Angeles, California, United States
 **California State University, Northridge, California, United States
- Objective:** As AIDS continues to disproportionately affect Blacks in the U.S. (CDC, 1988; Nays & Cochran, 1987), it is crucial to determine if their perception of risk is needed to design effective risk reduction interventions. One HIV-at-risk group for whom we have little empirical knowledge of their lifestyles (Cochran & Nays, 1988) are Black gay and bisexual men. The present study is a pretest effort to design an assessment instrument for a national study of HIV-related behavior.
- Methods:** Six focus groups, each composed of 8-10 Black gay and bisexual men, were conducted in New York, Chicago, Los Angeles, Atlanta, Omaha, and Pittsburgh. Methodology based on marketing and group dynamics was used to assess subjects' AIDS knowledge level, perceptions of AIDS infection credibility, and the influence of perceived discrimination on AIDS prevention services utilization.
- Results:** While knowledge of AIDS and its modes of transmission was high, distinctions regarding HIV, medical treatment and protective behaviors were more diffuse and less well understood. Utilization of AIDS preventive services within the White gay community were generally low.
- Conclusion:** Current methods of AIDS education, if they are to be effective must be sensitive to the role that ethnic minority status plays in illness prevention and health care utilization.

- D.666** **A PUBLIC HOSPITAL AND THE AIDS EPIDEMIC IN OAKLAND, CALIFORNIA**
 Edward Allen Seidel; J Veroff; T Hesse. Highland Hospital, Dept. Internal Medicine; Oakland, California. USA
- Objective:** To compare diagnoses, ethnicity, and transmission mode of HIV in 55 patients presenting to a newly formed outpatient seropositivity HIV clinic at Highland Hospital, Oakland, CA, with a similar group already existing for California.
- Methods:** Diagnosis, ethnicity, and risk of all 55 patients (51 males and 4 females) seen in a newly formed seropositivity clinic for HIV infection, are reviewed for the period 3/16/88 through 9/30/88. Pts. were provider or self-referred into the clinic.
- Results:** 64 (84%) of patients had diagnoses of AIDS or ARC, by WHO/ECDC and CDC criteria; and 4 (7%) patients had symptoms of HIV infection. 63% were Black, with AIDS/ARC dx. (n=44)
- | Ethnicity | No. | 1974 | Combined | Total |
|-----------|-----|------|----------|-------|
| Black | 262 | 71 | 242 | 601 |
| White | 112 | -- | 102 | 312 |
| Hispanic | 21 | -- | 12 | 41 |
| Asians | 22 | -- | 2 | 22 |
| Total | 417 | 72 | 356 | 1001 |
- Conclusion:** When compared with existing statistics for California, and the San Francisco Bay Area, this outpatient sample, represents a large proportion of Black individuals, presenting with AIDS or ARC. Heterosexual/bisexual risk, and IVDA are the most common transmission risk factors in this cohort of outpatients seen at Highland Hospital, Oakland, California. USA.

- D.668** **WHERE BOTTOM-UP AND TOP-DOWN APPROACHES MET: THE DEVELOPMENT OF A COMPREHENSIVE AND INTEGRATED HEALTH PROMOTION/AIDS PREVENTION PROGRAM *****
 Koss, David J., Lefkowitz, P., Belvin, K., Barrett, E., Kish, J., Naves, H* and White, C.P., Mount Sinai School of Medicine* NYC, NY, USA, East Harlem Block School** NYC, NY, USA.
- Objective:** The present provides a model for the development of a long-term, dynamic, comprehensive and integrated community based AIDS education/prevention program.
- Methods:** A multi-agency CHO was sought which would provide a strategic program site targeted to the multiple needs of young at-risk families and the schools in which they are served. This program was developed in partnership with a multidisciplinary research team. The process which led to the identification, participation and on-going needs-assessment of The East Harlem Block School, Inc., a multi-agency umbrella organization in a deprived inner-city community, is described.
- Results:** This umbrella organization includes 5 agencies with overlapping memberships -- an alternative educational school, nursery school, 2 day-care programs, a Youth in Action Program for adolescents and a staff of over 100. It thus provides multiple opportunities for programmatic targeting at the various segments (staff, families and students).
- Conclusion:** The case clearly identifies the need for a bottom-up, top-down approach in order to develop an effective, continuous, integrated AIDS education and primary, secondary and tertiary care prevention program. ***Funded by the Aaron Diamond Foundation

BARRIÈRES COGNITIVES-COMPORTEMENTALES DES SUJETS POSITIFS À L'ÉVÉNEMENT

Deputatis, Merg, Jarte, D., Martignolo, P., Vignola, D.,

Service Hospitalier de Diagnostico e Cura "Grande 1" - e Centro di Medicina Comportamentale (Responsabile Prof. G.F. Galimberti), Ospedale di Crema, Milano, ITALIA.

Objectif. Nous avons voulu étudier les aspects psychologiques des sujets positifs à l'ÉVÉNEMENT pour évaluer des programmes de soutien psychosocial.
Méthode. A ce moment nous avons examiné 70 sujets positifs à l'ÉVÉNEMENT avec le Questionnaire Behavioural Assessment-2.0, après nous avoir analysés les données obtenues avec un programme spécifique pour notre entretien. On a considéré comme groupe de contrôle la population (700 sujets) aux localités les plus reculées de l'Italie. On a aussi examiné les données statistiques des résultats avec le test de t de Student. Enfin nous avons évalué la significativité statistique des résultats avec le test de chi carré.

Résultats. On a constaté que moins il a été jugé que le 2% des sujets a des problèmes psychologiques. L'analyse des données nous révèle que 25% de nos cas. Ainsi la dépression a frappé le 2% des patients et il faut remarquer que nos dépressions ont un risque suicidaire très élevé. Le test de la personnalité qui a obtenu le plus grand nombre de fautes (personnalité) a été le psychotique (2% des cas). Il a aussi été constaté que une significativité statistique une plus grande vulnérabilité psychologique et un plus mauvais adaptation social de tes. En conclusion des données. De toute façon nous et le 30% des hommes ont utilisé des drogues. Pour réduire l'usage des drogues, les résultats ont été l'attention centrée après la découverte de la positivité à l'ÉVÉNEMENT utilisé au 5% des t.

Conclusions. Avec un support psychosocial paraît être initié dans le 43% des sujets positifs à l'ÉVÉNEMENT on peut seulement pour des raisons psychologiques mais aussi pour la possibilité relative application au plan psychosociosociologique.

D.677

INFLUENCE OF LOVELESSNESS AND SOCIAL SUPPORT ON THE EFFECTIVENESS OF ABEHAVIORAL INTERVENTION WITH HEALTHY MALES AT RISK FOR AIDS

Bassett, R.C., Laperriere, A., Hanson, G.P., Antoni, M.A.,

Fisher, M.A., and Schrimminger, M.L., et al.,

University of Miami, Miami, FL, USA; *Stanford University, Palo Alto, CA, USA.

Objectif. Increased anxiety and depression have been associated with acquiring a positive diagnosis for the human immunodeficiency virus (HIV). This may serve to further compromise an already vulnerable immune system, resulting in an increased risk for opportunistic infection and worsened disease prognosis. Affective assistance training appears to have a buffering effect on the distress associated with receiving one's anti-HIV-1 status. A reasonable question is whether aspects of being in a group intervention can influence these effects.

Méthode. To investigate this we assessed self-reported lovelessness and social support at three times in the course of the intervention. Healthy gay males (N=64) at risk for the acquired immune deficiency syndrome (AIDS) wishing to know their anti-HIV-1 status participated in this study. Subjects were randomly assigned to meet either control (n=32) or exercise (n=32) groups. The exercise group received 45 min of aerobic training 3 times per week for 10 weeks. All subjects learned their anti-HIV-1 status at week 10 and completed the UCLA Loneliness Inventory and the Social Provisions Scale at baseline and again at weeks 5 and 10. A 2x2 factorial analysis of variance was performed for each of the measures at all of the timepoints.

Résultats. There were no interaction effects between anti-HIV-1 status (vs -) and group (exercise vs control) on either measure at any timepoint. Further, the only significant main effect was at week 5 where the anti-HIV-1 (+) reported greater loneliness than the anti-HIV-1 (-) (F(4,25) = 34.89, F(1, 34) = 26, p < .05).

Conclusions. The overall lack of discrimination among the groups at the various timepoints of the intervention suggests that loneliness and perceived social support have minimal influence in the reduction of psychological distress reported by the intervention with individuals receiving their anti-HIV-1 status. This strengthens the notion that it is the specific intervention, aerobic exercise, per se, rather than merely the effect of being in a group environment-invention which accounts for the salutatory effect reported. Supported by NIMH, P50MH42453-03.

D.679

DEVELOPMENT OF A QUESTIONNAIRE TO DETERMINE KNOWLEDGE, ATTITUDES AND BEHAVIOUR TO HIV INFECTION

Francisco, J. Parga, Sexually Transmitted Disease Control Programme, San Juan, Puerto Rico.

HIV infection has been called by many a behavioral condition. As long as there is no cure or vaccine, the only available method to avoid infection with the Human Immunodeficiency Virus is avoiding the practices employed by persons at increased risk for infection. In order to develop educational campaigns, it is necessary to evaluate the levels of AIDS knowledge and attitudes.

A questionnaire was developed and validated using a group of judges.

Item validity was determined. Then, a pilot study was done using 450 subjects of which 43% were at increased risk for infection by HIV.

A final form of the questionnaire was developed after the pilot study.

The questionnaire is directed to Spanish-speaking subjects.

D.676

SUICIDIAL THOUGHTS AND ACTS IN HIV INFECTION SUSPECTS

Francisco, J. Parga, Sexually Transmitted Disease Control Programme, San Juan, Puerto Rico.

For many persons, infection with human immunodeficiency virus means the immediate development of AIDS and an early death. Suicide becomes a viable alternative to avoid long illness and to obtain control over the situation. In many cases, AIDS will not be developed in years. In order to evaluate the occurrence of suicidal thoughts, 400 subjects were evaluated within 4 categories through the use of a questionnaire: 1) Persons who go to get tested for antibodies against HIV for the first time; 2) Persons who go to receive their results for the first time; 3) Repeat testers and 4) Persons who attend a testing site but do not get tested. Results indicated various patterns related to the persons at increased risk for suicidal thoughts and acts.

D.678

ÉVALUATION DES RÉACTIONS PSYCHOLOGIQUES COMPLEXES CHEZ LES HÉTÉROSEXUELS SEROSOPositifs (ANTI-HIV) ADOPTEUR/QUIES

Becher, Sophie, Pasqua, A., Virelli, M., Du Jardin, P.,

ROCHEFORT, J., GASTELIS, J.

Ligue Régionale Française de Lutte Contre le SIDA - C.H.R.U., Nice, France.

En 1989, le nombre de séropositifs asymptomatiques est estimé en France à 300 000. Les deux régions les plus atteintes par les infections à VIH sont l'Île-de-France et la Provence-Alpes-Côte d'Azur, la proportion d'hétérosexuels exclués est en constante augmentation, tant en ce qui concerne les cas de SIDA avéré (10,3% en France vs 30,0/100) que les porteurs asymptomatiques. Parmi une cohorte de 100 hétérosexuels asymptomatiques, 16 (11 femmes/5 hommes) ont fait l'objet d'un test de dépression (échelle d'Hamilton-Policier), d'un test d'anxiété (échelle T.A.R.D.), d'un test de l'attachement (thème Soral) et d'un entretien semi-directif. 3/16 n'ont aucun symptôme dépressif, 8/16 présentent une dépression mineure, 4/16 ont une dépression légère et 1/16 une dépression grave. Part rapport à l'annonce de la séropositivité, un taux d'anxiété élevé apparaît en général après une période de sidération de durée variable. Ce taux d'anxiété élevé dure jusqu'à 12 mois et lui succède une phase de réorganisation (psychologique et comportementale) où l'anxiété décroît. L'intensité de l'anxiété semble plus marquée chez les hommes et elle augmente nettement après 26 ans dans les deux sexes. Cette anxiété est plus importante dans le rôle relationnel. Lors de l'entretien directif, ce sont les thèmes de préjudice (y compris d'ordre médical), de victime, d'insécurité de la société (cerceur d'information), d'exclusion qui émeuvent le plus fortement. Le test de l'attachement dénote une quête d'équilibre personnel et un besoin d'acceptation par l'entourage.

D.680

LES ATELIERS SUR LES ACTIVITÉS SEXUELLES VIEilles RÉSISTES A SA SANTÉ

Sourdis, Isabelle, Larocque, P.,*

COMITÉ SIDA SIDA Montréal, Montréal, Québec, Canada; **Université du Québec à Montréal, Montréal, Québec, Canada

Objectif. Décrire l'organisation des ateliers et présenter les données évaluatives recueillies de février à mai 1989.

Méthodes. Des groupes de 15 personnes sont formés et animés par un sexologue et un assistant-technique. Les participants sont des hommes ayant eu des contacts sexuels avec d'autres hommes (gais et bisexuels). Ils reçoivent 2 sessions de 3 heures dont les objectifs sont: 1) acquérir des connaissances sur les act. sex. 2) risques réduits; 3) développer des attitudes positives; 4) développer et maintenir de nouveaux comportements et 5) améliorer la qualité de sa vie sexuelle. Le matériel utilisé comprend des dépliants, affiches, vidéos et la distribution d'une trousse. Le questionnaire est distribué au début et à la fin des ateliers. **Résultats.** Les résultats proviennent des questionnaires concernant les objectifs et analysent les connaissances acquises, la modification des act., les cpt., et la place de la sexualité dans la vie personnelle. **Conclusion.** Nécessité de ce type d'intervention, besoin de l'implication des participants. Structurer les act. sex. à risque réduits dans un contexte de nouveaux modes de vie.

THE MEDICAL AND EMOTIONAL/SUPPORT NEEDS OF WOMEN WITH HIV
Debbie Thorne* & **Beaulieu, R.*****
 *AIDS Committee of Toronto, Toronto, Ontario, Canada
 **Basic Free Clinic, Toronto, Ontario, Canada

Objectives. To describe the medical needs and psychosocial concerns of women with HIV. To describe a model for support groups for women.
Methods. Initial findings were obtained from 8 members of a support group for women. A further 12 women were given a structured interview.

Results. Qualitative analysis revealed the following issues:

I. **Medical Needs** -- Women reported difficulty in obtaining an accurate diagnosis of HIV infection and immune status. Two-thirds of the women reported increased symptoms specific to their hormonal and reproductive physiology, but only vaginal candidiasis was accepted by physicians as a marker of HIV status.

II. **Emotional Needs** -- Women were more likely to experience shock at diagnosis, and to feel anger at the infecting partner. Isolation within their own support networks and even within the AIDS community was noted. Stress levels increased for those involved in the caregiving of HIV-infected men, those with infected children and those mourning the loss of child-bearing possibilities.

III. **Support Group Issues** -- Despite varying backgrounds, common concerns were found on issues such as reactions to diagnosis, disclosure, relationships with men and the need for improved access to medical and treatment information and services.

Conclusions. That researchers have not fully investigated the medical needs of women with HIV. That support groups for women can be effective, where tailored to their specific needs.

D.689

On being HIV+ positive, European, female, and "non-existent".

Annette Hegge, Copenhagen, Denmark. Positive Women's Support Group, Copenhagen, Denmark

The main topic of this paper will be the situation of HIV-positive women, (non IV drug abusers) in Denmark, and the trials and tribulations of this group in establishing their "help" groups.

The underlying theme of the presentation will be the struggle of this group for recognition in a community which, until quite recently, refused to recognize that heterosexual HIV+ positive people even existed.

The paper will attempt to discuss the social isolation experienced by HIV-positive women in this country, and the attempts made, by means of self-help groups and our own presentations in the media, to break this isolation. The following is an extract from a speech held by the author at WHO's regional office in Copenhagen on World AIDS Day, 1988:
 "To be a Positive woman is incredibly lonely. Heterosexual circles are simply not used to the idea. When I was diagnosed, I contacted the AIDS - Hotline, looking for support and information for women with HIV / AIDS. There was absolutely nothing for us women. Today the situation is not much better... but now we've started our own support group - we're getting stronger".

The paper is based upon the author's own personal experiences as an HIV+ positive woman.

D.691

HOW AND WHY IN LATIN AMERICA: LESSONS FOR THEIR FUTURE

K. SANDRINI, F. STONE

Johns Hopkins University/ABDOCO, U.S.A.

Objectives: To illustrate the importance of developing AIDS prevention interventions targeting non-prostitute women in Latin America.

Methods: An evaluation of existing AIDS prevention programs in Latin America revealed a wide absence of programs targeting women not employed in prostitution. The epidemiology of AIDS amongst the vast majority of HIV positive currently seropositive and at-risk sexually active women was the epidemiology of AIDS in the general population. There were very few cases reported in 1988 occurring among women, suggests that this pattern is likely to persist.

Results: An unmeasured number of women have more than one sexual partner, plan to do so for HIV/AIDS. The fact that so common percentages of men have multiple partners, including female and male prostitutes and other men, also places "heterosexual" female partners at risk. These risks must be understood and addressed. In order to improve prevention interventions in Latin America, the epidemiology of AIDS in the general population must be understood. Researchers tend to ignore that non-prostitute women are also at risk.

Conclusions: Program planners must recognize that non-prostitute women in Latin America are also at risk for HIV/AIDS. Programs are needed to educate them and modify their behavior to reduce their risk of exposure to HIV.

D.688

CLINICAL ASPECTS IN THE FIRST 81 AIDS CASES AMONG WOMEN IN MILAN

Adriano Morfanti Antonelli*, Galli, M., Vignani, G.M.**,**

Vignoli, P., Seracino, A.**, Rizzardi, G.M.** and Valacchi, L.L.**,
 *Infectious Diseases Clinic, and **Infectious Departments, Sacco, Milan, Italy**

Objective. The main risk-factor for AIDS in Italy is IV drug use (IVDU). A considerable number of cases occur in women. Objective of this study is to describe clinical aspects of AIDS in women.

Methods. 478 cases of AIDS (16.4% of total Italian cases) were recorded from 1984 to 1988 in I. Sacco Hospital, Milan. All informations have been collected from clinical records.

Results. 81 out of 478 (16.9%) AIDS cases were diagnosed among women. 46 of them (56.4%) were IVUDU, 16(19.7%) were previous IVUDU (ex-IVUDU), 17(21%) were sexual partners (SP) of anti-HIV pos. men (16/17 recorded from 1987) and 2 (2.4%) were transfused (all before 1985). PCP was significantly more frequent an indicator-disease in SP (10/17) and ex-IVUDU (7/16) than in IVUDU (6/46) (p 0.001 and p 0.01 respectively), while deep fungus (DF) was more frequent in IVUDU (15/46 vs. 3/23, p 0.05). Kaposi's sarcoma (KS) was observed in 7 cases (9.6%) and lymphoma in 2. AIC was present in 6 cases (5/6 IVUDU).

Conclusions. DF have been considered to be more frequent in IVUDU, while ex-IVUDU have clinical course similar to SP. KS is relatively frequent among women.

D.690

RICE BIALS DO GET AIDS: A SUPPORT SYSTEM FOR MIDDLE CLASS WOMEN WITH HIV INFECTION

Nicholas Nussbaum, Paffer, M.,

*Beth Israel Medical Center, New York City, USA

Objective: To present a rationale for and a model of support needs for middle class women in the US: identifying needs, establishing services, and making them available to patients.

In early 1988, two seropositive professional women requested that a supportive network be created for middle class women. Existing support groups focused on IV drug problems and did not meet their needs. At times, attending these groups made them feel even more estranged from other patients. A survey of treatment agencies and individuals showed that a need for this service existed. A support group began meeting twice monthly in August 1988. As of January 1989, 35 women had attended the group or social activities. The problems which have surfaced will be discussed along with the measures taken to address them. Recently services have begun for the husband and boy friends in a separate group. Guidelines for creating similar services in other facilities will be offered.

D.692

PREVALENCE OF ANAL INTERCOURSE IN WOMEN AT A COUNSELING-TESTING SITE

Comolly, Dennis, Brennan, A, Waters, D, Gocke, D,

Robert Wood Johnson Medical Center, New Brunswick, New Jersey, United States of America.

Objective. The high risk of HIV-1 transmission by anal intercourse is well-recognized for homosexual men, but the frequency of this activity in heterosexuals is not well known.

Methods. We questioned 102 consecutive female clients of our HIV counseling and testing service about their participation in anal intercourse and other risk activities using a directed questionnaire. Their ages ranged from 17-46 years. 82 were white, 9 black, 7 Hispanic and 2 Asian.

Results. Twenty-one reported anal intercourse at some time in their life. Eleven reported the frequency to be "occasional", 5 reported varying frequencies as often as once weekly, 1 reported a preference "all the time", and 4 declined to report frequencies. The 6 individuals reporting frequent or preferred anal intercourse also admitted to multiple sexual partners and unprotected sex.

Conclusion. Thus, 21% of an unselected sample of heterosexual women attending an HIV counseling center had experienced anal intercourse at least once. 6% who did so frequently also engaged in other high risk behavior. This study supports the need for health care providers to recognize the frequency of anal intercourse in heterosexuals and to provide topic specific counseling.

EVOLUTION

AMÉRIQUE

SORCABA AMBULATORY AIDS EXPERIENCE WITH PROSTITUTES

SONCALVES, V.L.C. - Dos Anjos, R.M.F. - Ramos, T.F. - Gomes, M.C.O., BRAZIL
Our study has been realized with 54 promiscuous sexual life women, in a period going from January 1986 to November 1988, and among the following was observed:-

1. Median age 26,68 years (14 to 41 years).
2. 24 women have children, and among them 67% have more than 01 and less than 05 children.
3. 28 women (51,85%) mentioned and/or was confirmed that had Transmissible Sexual Disease in some period of their life.
4. 15 women (27,7%) used or are using injectable drugs.
5. 13 women (24,07%) present 8 type Hepatitis positive marking.

From the mentioned 54 women 15(27,7%) presented positive HIV (ELISA recommended method).

1. Median age 23,66X (14 to 31 years).
 2. 07 women have children (median 3,14 children).
 3. 09 women (60%) among the ones of positive HIV, mentioned and/or was confirmed, had some transmissible sexual disease in some period of their life.
 4. 10 women (66,6%) used or are using injectable drugs.
 5. 03 women (20%) present 8 type Hepatitis positive markings.
- None of the said women presented AIDS symptoms.

LES KINSHOIS FACE AU SIDA: UNE TOPOGRAPHIE DE RISQUE

BUMUCADILLA, M.M. - Wau Engundwe*, Schoepfer, R.G.**, Payenroo Iwera*

* Harvard School of Public Health, Boston, USA; ** Projact COMBIBSIDN, Kinshasa, Zaïre; *** Institut Pédagogique National, Kinshasa, Zaïre.

Objectifs. Les Femmes et enfants sont particulièrement à risque du SIDA en Afrique. Comprendre les causes sociales profondes des risques et des contraintes aux changements de comportements.

Evaluation. Evaluer les risques des Femmes dans des circonstances diverses.

Méthodes. Observations-participantes, entretiens en profondeur et analyse institutionnelle qui lient la macrosociologie au comportement des individus.

Résultats. Une topographie des relations sociales avec leurs circonstances matérielles et psychologiques particulières permet de décrire les risques différenciés des femmes différemment situées dans la société. Il ressort des liens précis démontrant comment les comportements individuels sont médiatisés par les institutions socioculturelles.

Conclusion. Des changements socioculturels qui augmentent les ressources dont disposent les Femmes de toutes les conditions sociales sont nécessaires à la prévention du SIDA chez les femmes et leurs enfants à tout âge.

Mots-clés: risque, Femmes, ressources, changement

ASIAN WOMEN AND AIDS - RESEARCH ISSUES
Yosh, Shoji*Ozawa, PhD in Anthropology, New Delhi, India

This paper identifies behavioural research issues on Asian women and AIDS. It points out that current information/Education for Health strategies used to educate female prostitutes and women about AIDS are often oblivious to the main problem of women's powerlessness. Research is needed on sex tourism and how it contributes to the vulnerability of women and children to AIDS. Also, more information is needed on the "veil of ignorance" which puts women into a communications "purdah" or seclusion. Even when confronted with health information about sexuality, women may not acknowledge it with a behavioural change as it would violate cultural rules of this communications "veil". Efforts to mobilize women's groups at community level can help to bring women out of this "seclusion", but these efforts have yet to gain widespread support. The paper identifies a number of research/action areas which would help Asian AIDS programmes to support women who are struggling to translate knowledge into behavioural change.

D.696

AGE RELATED KNOWLEDGE AND ATTITUDES IN FEMALE CLINICS OF SELECTED HEALTH DEPARTMENT CLINIC, HOUSTON, TEXAS

Torreson Jr, GENE, MD, PhD, FRCPC, FRCGP, M.D., MPH, M.P.H.

* University of Texas Health Science Ctr, Houston, Texas, U.S.A

** Department of Health and Human Services, City of Houston, Texas, U.S.A

Objectives: To determine AIDS-related knowledge and attitudes in women attending selected city health department clinics in Houston, Texas.

Methods: Between 2/28 and 3/25/88, 95 women attending Family Planning, venereology and sexually transmitted disease (STD) clinics completed an anonymous, self-administered risk assessment questionnaire and a brief knowledge (9 questions) and attitude (4 questions) questionnaire.

Results: Overall, 48% of the questions were answered correctly. Questions concerning means of transmission (parenteral, perinatal, sexual) were known (85% correct), but knowledge of natural history of the disease was limited (43% correct). Women with < 4 years of education did worse (p<0.05) than those with > 4 years; Hispanic women (43% correct) had fewer correct (p<0.05) than blacks (43% correct) or whites (49% correct). Hispanic women who completed the questionnaire in Spanish were especially disadvantaged (37% correct). After adjusting for education by multiple linear regression, ethnic differences remained. Eighty-two percent (82%) of respondents believed an IV-drug partner should "never" use condoms but only 58% indicated their partner would do so.

Conclusion: Overall knowledge was limited in this population. Hispanic women completing the questionnaire in Spanish and women with < 4 years of school were at a distinct disadvantage with respect to knowledge about STD.

D.697

THE SEX INDUSTRY AND THE AIDS DEBATE - Australian Conference

Owens, Cheryl, * Bates, J.*

*Prestitutes Collective of Victoria, Australia.

The Conference aimed at AIDS, to disseminate information to the community and the sex industry and to consolidate and develop the policy required to maintain low infection rates.

Conference participants included a range of sex workers and managements, service providers, administrators and policy makers. Keynote addresses and workshops covered subjects including: testing; education strategies and health and welfare issues. Extensive "special" interest workshops were held (L.A., transsexual workers' issues, condom design).

Speeches and workshop recommendations have been published and widely disseminated. Groups were formed of workers from each state where none previously existed.

(4) An exchange of information occurred and a network established which will effect greater consistency and effectiveness in policy and program development aimed at limiting the spread of HIV in the sex industry.

D.698

CONDOM INSTRUCTIONAL BOOKLET FOR FEMALE SEX WORKERS (An Integrated Project)

Pérez, Bernaldo, Rosario, Santo. PROCTET, Ministry of Public Health, Santo Domingo, Dominican Republic

For the development of a Condom Instructional Booklet nothing was assumed. A study was first made to determine the knowledge, attitudes and beliefs of female sex workers of Santo Domingo, D.R. had in regards to condom use and correct placement steps. Once the workers' beliefs, attitudes and patterns of use with their clients were determined and analyzed, a pilot instructional booklet was designed with a creative focus group of female sex workers and an artist.

This pilot was pre-tested. Results showed very low grasp of key message, "Condom protects against AIDS." Two simplified versions were done and pre-tested again. With the results, a combined final version will be printed in sticker format to be placed in motel, hotel, and brothel rooms.

The whole process and materials will be shown.

Le SIDA et l'individu
AIDS and the IndividualSexology
Sexology**D.699** AFFECTIVE RESPONSE AND HIV SEROPOSITIVITY IN LESBIANISM FROM AFRICA (LMA).

Annex Cecilia, M.; Page J.; Maitre I.; Ponsol J.; Pissot J.
Service of Internal Medicine, Hospital "Gaston Pasteur I. Péri", Université
Antoine de Meville, Marseille, France.

Objective: To evaluate the affective reaction and seropositivity an associated with HIV seropositivity in LMA that potentially acquired HIV infection by sharing medical practices.

Methods: We tested anxiety (STAI-Trait) and depression (Beck's Depression Inventory) in 201 lesbians (104 HIV index and 95 females) studied in a diagnostic unit. From January 21 to December 31, 1988, we tested the first day of admission. Furthermore co-factors as: serotyping (anti-HIV), prison, social status, and daily habits (smoke and alcohol) HIV antibodies were tested by ELISA test.

Results: Being seropositive was the only risk factor. Studying in clinical anatomy other risk factors. (HIV) patients (10.1%) were HIV and (HIV) (18.1%) were not. Differences for seropositivity were in class of medication (14.1% vs 23.2% in a HIV and 13.1% vs 14.1% in HIV) and social status (1.1%) being the seropositive is sex, age, actualizing level, prison, daily habits (smoke and use of other drugs).

Conclusion: Anxiety and depression are frequent in lesbians however but the affective disorders are not related to HIV seropositivity, but the infective results of sharing medical care seem to be influenced by affective disorders.

D.701 CONDOM USE AMONG HOMOSEXUAL MEN

McComb, S.*; Rust, J.**
*City University, London, U.K., **London University, Institute of Education, U.K.

Objective: To investigate condom use during sexual activity and to identify HIV problems associated with the use of condoms.

Methods: A postal questionnaire survey of 262 homosexual men.

Results: It was found that, in spite of the general move by homosexual men towards safer sex practices, half of the men continued to engage in insertive anal intercourse. Almost 90% ejaculated during this activity and of whom one third did not use a condom. Additionally, 90% of those who ejaculated during oral sex did not use a condom. Thirty two percent of those who had used a condom during anal intercourse reported at least one incident of condom breakage. When looked at in terms of frequency of individual condom use, it was found that 1 in 27 condoms break during this activity. Examination of the reasons reported for breakage indicated that physical stress on the condom was almost always thought to be responsible for these incidents.

Conclusion: Given that current condoms have been designed for vaginal use, these results indicate the need for an investigation of a separate specification for homosexual anal intercourse.

Consommateurs de drogues par voie intraveineuse
IV Drug Addicts**D.703** COUNSELLING INTRAVENOUS DRUG ABUSERS ABOUT AIDS AND HIV-TST IN THE OUTPATIENT METHADONE CLINIC

Department of Social Psychiatry University Hospital, Zürich, Switzerland.

Objective: Should the test be recommended to methadone patients and to deal with all patients.

Methods: Therapeutic consultations of 2 centres for drug-addicts were questioned about 97 well-cared for patients.

Results: Disruptive reactions about a positive test were rare. In 2 of the 3 observed cases the positive test was combined with first symptoms of AIDS. Negative as well as positive patients protected themselves an others better and showed increased compliance in medical care after knowing their status. Patients however who had avoided the test changed their behavior less during the period of evaluation despite of numerous public safety campaigns. The severely ill patients tend to deny their situation (often with the help of drugs) most of the time. However at those rare moments when dental breaks down self-aid to despair the need very much an open discussion with a person they can trust.

Discussion: The most important issue is to combine methadone treatment with professional counselling and medical care. Only within a good relationship to the therapist can a normal coexistence of the body and the object relations be established in the former IVDA, which then results in better prevention.

D.700 CONDOM USAGE DECISIONS AMONG GAY MEN

Larkin, Martin¹; Brooks, C.²; Sichel, K.²
¹Stanford College, Menlo Park, U.S.A.
²Memorial Sloan-Kettering Cancer Center, New York City, U.S.A.

Objective: To understand gay men's decisions to use or not use condoms.

Method: Focused interviews.

Results: Analysis of qualitative data from an ongoing study of sexual decision-making among gay men expands our understanding of condom usage within this population. The initial 80 interviews indicate that varying perceptions of the risks associated with insertive and receptive intercourse (anal and oral) highly influence condom usage. Men who believe that condoms prevent transmission of HIV during anal and/or oral intercourse are likely to use condoms. However, men state the following beliefs as reasons for not using condoms during fallatio and anal sex: 1.Receptive anal intercourse without ejaculation or prenasal fluids does not transmit HIV. 2.HIV is not transmitted to the insertive partner during anal intercourse. 3. Condoms are more oral sex without ejaculation or prenasal fluids does not transmit HIV. 4.Receptive oral sex even with ejaculation or prenasal fluids does not transmit HIV because saliva and gastric juices kill the virus. Furthermore, some men decide to abstain from oral and anal intercourse because they believe that condoms decrease erotic pleasure or are ineffective protection against HIV transmission.

D.702 SEXUALITE DES PERSONNES DEVENUS SEROPOSITIVES ANTI-VII

Bachet-Morellet, Sophie¹; Dutey F.²; Motrono G.Vand Trapp O

¹Hôpital NORD-EST ²Hôpital des Sciences, Lyon, France.

Objective: La sexualité des personnes devenues séropositives anti-HIV nous a paru importante à explorer de fait des difficultés nouvelles liées à cet

absence d'aide de référence sur ce thème.

Methods: En 1988, nous avons distribué un questionnaire anonyme à 86 personnes séropositives anti-HIV suivies dans centres spécialisés de Lyon.

Une centaine de questions portait sur leur vie sexuelle, affective, relationnelle, leurs représentations corporelles et leur sexualité.

Résultats: Les résultats montrent que cette population semble vouloir une sexualité sexuelle complexe (3 profils émergeants possibles). Dans les entretiens de la découverte de la séropositivité anti-HIV, l'individu se perçoit comme dévalorisé avec un vécu corporel de mort, de malaise, de transformation irréversible. La sexualité est marquée du fait d'une sidération importante de leur réalité particulièrement chez les homosexuels. Les actes en couple initialement décrits avec chute de la communication dans leur relation à l'autre tandis que 50 à 60 des couples évoluent vers la rupture ou l'isolement relationnel. L'information sur la séropositivité anti-HIV est détournée au maximum unique dans 80 à 85 des cas, et dans 3 des cas à ses partenaires sont multiples.

Conclusion: Cette population semble dans l'attente d'une écoute et d'une reconnaissance de ses difficultés. 30 à 40 % demandent une aide sur le plan sexuel qu'il nous paraît indispensable de proposer, associée au cadre de suivi médical de ces personnes.

D.704 ACCEPTABLE HEALTH CARE FOR IV DRUG USERS

Kiloh, Richard and McCarthy, M. AIDS Coalition to Unleash Power, New York, New York, U.S.A.

Objective: To discuss new case management strategies for HIV-infected IV drug users (IVDU). **Methods:** Interviews with recovering and active addicts, drug treatment professionals, physicians and community based health care workers. **ADAPT. Message:** In evaluating treatment for HIV-infected IVDU, we must consider the following models for treating IV drug use. **Method:** Outreach maintenance programs are characterized by an emphasis on controlling and monitoring the addict rather than on effective treatment of the disease. This strategy is inappropriate for treating HIV infection. The centralized research model has an inadequate treatment capacity and is impossible to meet IVDU. Flexible, community-based treatment, mobile support service units, and outreach programs for IVDU are underfunded, while research programs are designed to increase established funding sources. There is a need to make drug treatment available on demand in combination with health care for HIV infection: an active IVDU who is not dealing with his/her addiction cannot be expected to keep doctor's appointments. Because most IVDU live outside the health care system, they do not have access to preventive treatment for HIV infection. They enter the health care system after they are asymptomatic. IV drug users, routinely handled with prudence and coercion, need to understand informed consent and patients' rights before receiving experimental AIDS therapies. Support services must accompany the HIV test. **Conclusion:** Viable strategies for case management of HIV-infected IVDU should be flexible, community-based, accessible, and together with drug treatment, available on demand.

D.705 EVALUATION OF A SUPPORT PROJECT FOR IV DRUG USERS WITH AIDS IN AMSTERDAM

DOOR: Frans van den Berke, Jacky Driessens, Anita Meesters
Netherlands Institute of Mental Health, Utrecht, Netherlands

Objective: evaluate effectiveness, feasibility and endurance of a support project for IV drug users with AIDS. **Method:** Often IVUs do not have stable relationships or supportive networks. Contact with family of origin may often be disturbed. Referral from the hospital to the "home" situation can be difficult, because of the absence of a home(life) and/or a supportive network. In Amsterdam a support project for IVUs had been operative since January 1989. The program will be evaluated with respect to feasibility, endurance, effectiveness and client satisfaction, using Goal Attainment Scaling, Problem Oriented Records, and psychiatric interviewing instruments.

Results: The first results of the study will be presented.

D.706 Social characteristics of drug-addicted and non-drug-addicted patients for human immunodeficiency virus.

Authors: Louis J.G. Meeus, Sophia J. Prins, Bart van der Wal, Peter van Tilburg and Antonio Lauri. - Franciscus J. Meelis Institute, Groningen, The Netherlands.

Abstract: Analysis of the different social characteristics in female patients seropositive for human immunodeficiency virus (HIV) and drug-addicted persons.

Methods: Analytic and clinic investigation. Social relations studies of 35 female patients seropositive for human immunodeficiency virus (HIV) and drug-addicted persons.

Results: Comparison of clinical classification of diseases caused by HIV revealed 28 HIV patients to Group II, 40 patients (75,7%) belong to Group III, and three patients (5,4%) belong to Group I.

All of the mentioned patients were drug-dependent.

Age of the mentioned patients ranged from 19 to 47 years. The age of the non-addicted patients ranged from 19 to 47 years.

Of the mentioned patients, 11 (31,4%) were never married (11,7%) and four (11,4%) were married (10,4%). 14 (40,0%) patients had had sexual relations and shared needles with persons infected with AIDS, and 41 (80%) used to have sexual relations with several persons.

Many of the HIV had antecedents of use of more non-transmissible diseases and/or viral hepatitis B.

The serology of HIV was investigated. Concomitantly tests laid out a 100% sensitive. In France three groups of different social characteristics.

In accord with the authors classification, HIV positive patients: A-B-C-D-E-F-G-H-I-J-K-L-M-N-O-P-Q-R-S-T-U-V-W-X-Y-Z.

Group I: 35 patients (70,5%)

Group II: 12 patients (23,8%)

D.707 HIV TRANSMISSION IN SEMI-CLUSTED CONDITIONS OF BRANCHES OF TROPICAL MEDICAL CENTERS

Authors: E. A. Mareschak, N. S. Stetler, L. J. Carvalho, M. S. Lima, M. P. J. S. Belloni, E. S. B. C. Castro Corsini. (CCIL), Campinas, São Paulo, Brazil.

Objective: To analyze transmission of HIV under simulated conditions of absence of hygienic equipment by intravenous drug users.

Methods: In a laboratory setting, hygienic equipment was exposed to HIV (in viral titration). Attempts were made to culture virus in media after eight conditions of exposure.

(1) Uncontaminated needle-syringe left lying for an interval of one minute or one hour after exposure ("floating needle"); (2) A series of needles exposed and left lying for 15 seconds or a minute ("needle stick"); (3) Liquid medium exposed to HIV-contaminated media ("shared syringe"); and (4, 5) separate or incomplete disinfection with bleach and/or water ("disinfection trials"). These separate trials were made under each condition.

Results: HIV was successfully cultured under all three trials each of the "floating needle/syringe" trials, the "needle stick/syringe" trials, and the "disinfection trials with water" conditions. HIV was not cultured from any of the three trials of each of the "floating needle/syringe" trials, the "needle stick/syringe" trials, the "shared syringe", the "disinfection trials with bleach", or the "disinfection trials with water" conditions.

Conclusions: HIV originates from empty, contaminated syringes, or under well-washed conditions, appears to be less dependent. HIV would appear to be viable for a longer period of time as opposed to needles in the interior of hygienic equipment than on the exterior surface. HIV disinfection by bleach rinsing appears to be efficacious; water rinsing does not appear to be effective.

D.708 CONTRIBUTION DE LA PSYCHOLOGIE ET LA PSYCHIATRIE A LA PRISE EN CHARGE INSTITUTIONNELLE ET INDIVIDUELLE DES TOXICOMANES INFECTES PAR LE VIH.

Charles-Nicolas A. * et Condomini J.P. **
*Psychiatre, Mécéc-Directeur du Centre Pierre Nicole, Croix Rouge Française, Paris. **Psychiatre, Mécéc-Consultant au Centre Pierre Nicole, Croix Rouge Française, et Délégué Médical d'ADAPT (Paris).

L'approche phénoménologique temporelle des difficultés psychologiques rencontrées par les toxicomanes confrontés au sida illustre le défaut fondamental que représente l'aspect temporel chronique chez le sujet présentant des conduites addictives toxicomaniales. Les aspects spatiaux et corporels sont étudiés. La clinique analytique permet de mieux appréhender les mécanismes de défense mis en place par le sujet toxicomane séropositif pour le VIH ou déjà en traitement pour le sida. Le concept de la conduite ordinale donne une explication à l'intégration du sida comme une nouvelle conduite de risque chez le toxicomane. Ces deux approches sont complémentaires et dégagent de nouveaux axes psychothérapeutiques en matière de prise en charge institutionnelle et individuelle des toxicomanes infectés par le VIH. Plusieurs cas cliniques de patients suivis pendant deux années minimum sont exposés.

D.709 HIV INFECTION IN I.V. DRUG ABUSERS :

Letts, E.A.; Mareschak, N.; Stetler, L. ; Carvalho, M. S.; Lima, M. P. J. S.; Belloni, E. S. B. ; Castro Corsini, (CCIL), Campinas, São Paulo, Brazil.

Objective: To measure the prevalence of the HIV infection in I.V. drug abuse. (spontaneous request).

Method: The I.V. drug abusers in attendance of CCIL are tested for HIV (E = WB). The patients are oriented by a multidisciplinary education and assistential program and the seronegatives are retested more or less in each 3 month.

Results: 61 I.V. drug abusers, 43 (tested positive with HIV infection) were seropositives between 11 and 35 years of age (32,5% less than 20 years of age) and 42% with less than one years of I.V. 36 patients have been attended drug user. Of from group I, 13 from group II, 14 from group III, 03 from group IV and 05 which have not been classified.

Conclusions: The risk of an acquisition of HIV between I.V. drug abusers is extremely high, where we can see that most of the seropositives an contaminated with less than one years of I.V. drug user.

D.710 AIDS AND PSYCHOSOCIAL TREATMENT

Authors: Irving Huk-Frivate Practice, Calgary Alberta, Canada.

Objective: An exploratory study systematically examined the hypothesis that a specific social work intervention, Heimer's Social Functioning, would provide effective psychosocial care to persons with AIDS. **Methods:** The method employed to test the hypothesis was a single system design, specifically, the ASA model. The study was replicated with seven subjects, five of whom were homosexual males, one a bisexual male and one a female intravenous drug user. Four subjects completed the study, two died and one withdrew because of memory loss. The instruments used to measure needs and response to treatment across the three phases included Heimer's Scale of Social Functioning (Heimer, 1987) and a Self-Anchored Scale specifically designed to measure the person's feelings and perceptions of memory and body images changes. **Results:** Findings revealed that distress permeated all dimensions of the person: physical, emotional, intellectual, social and spiritual. The intervention alleviated perceptions of distress and promoted coping that increased quality of life.

USE OF PROPRANOLOL FOR AGITATED BEHAVIOR IN AIDS
SHEINMAN, CARL
St. Vincent's Hospital and Medical Center, New York, USA

Objective: Although AZT is useful for the treatment of HIV encephalopathy, behavioral disturbances in these patients may remain during with this drug. Propranolol has been described to be useful for agitation and other behavioral disturbances associated with Huntington's chorea, a disorder which also affects primarily subcortical structures. Propranolol was used to treat agitation in a patient with AIDS dementia.

Methods: A 29-year-old homosexual male had progressive gait and cognitive impairment over a 3-month period. He became doubly incontinent and confined to bed because of poor balance. After 5 weeks of therapy with oral AZT he became able to ambulate. However, he was hypomanic and disruptive. Incontinence persisted. Propranolol (120 mg in two daily doses) was added to the therapeutic regimen.

Results: Addition of propranolol resulted in marked improvement within 10 days. Incontinence, paranoia and outbursts of agitation disappeared. Propranolol was discontinued after 10 weeks and improvement persisted. The patient continued to take care of himself at home and was fully ambulatory and oriented. A mild attenuation of affect persisted.

Conclusion: This clinical observation suggests a role for propranolol in the treatment of the behavioral disturbances observed with HIV encephalopathy. Experience with a cohort is needed to substantiate this observation.

D.712

Coping With the Psychological Effects of an HIV Infection in Patients in Outpatient
and Inpatient

LEUNG, TERRY, LACROIX, BÉLIS
Université de Montréal, Québec, Québec

Aim: To assess the effectiveness of psychological support services

in the follow-up of various psychological and sociological factors such as drug addiction of female patients with HIV infection and/or their partners, sexual contacts, personality characteristics in their interacting with the illness.

Group studied:

40 of 111 patients with an HIV infection who had special counselling from 1982 to 1983. 63 were interviewed on a volunteer basis.

Method:

Besides the interview a sociological-psychiatric evaluation and behavior analysis were conducted between interview and re-interview treatment.

Results: In the group of drug addicts, we saw counter-productive forms of coping with the illness. This was shown by denial, behavioral which was inappropriate to the illness, extraction of anger and despair.

Conclusions:

The psychological and sociological programs encompassed medical treatment, including a partial substitution program using naltrexone to substitute drug use influences the negative manner in which drug addicts cope with being HIV positive in a positive way.

D.713

ANGER: AN IMPORTANT PSYCHOLOGICAL MEASURE IN HIV DISEASE
LAVY, ELIZABETH, KUPFF, P., JILINS, R., JAYAR, K., STODDARD, A., AND
ANDERSON, J.

Boston University School of Medicine, Boston, MA, USA; **Farnsey Community Health Center, Boston, MA, USA; ***University of Massachusetts, Amherst, MA, USA; ****To establish baseline data for the associations for psychological and immune parameters in a cohort of sexually active gay and bisexual men.

Methods: The first 150 members of a cohort from the FHC were given a battery of psychological measures (including Anger Expression Scale, Hardiness Test, and Profile of Mood States) and had blood drawn for immunological measures (quantitation of CD4 and CD8 subsets, lymphoproliferative assay).

Results: Differences between groups were found for the number and % of CD4 lymphocytes and % of CD8 lymphocytes and the response to the mitogen PHA and ConA using one-way ANOVAs. Surprisingly, the groups did not differ in any of the psychological measures. However, there were intriguing differences in correlations between the groups. The most interesting involved the anger expression scales as indicated in the table below. * p < 0.10, ** p < 0.05

HIV- HIVNA HIV+0		HIV- HIV+0	
Ang-In v CD4	0.22 -0.45* -0.35	Ang-In v CD8	-0.01 0.23 0.78**
Ang-Out v CD4	0.03 -0.29 -0.42	Ang-Out v T4	-0.10 0.42 0.76**
Ang-Out v PHA	-0.06 0.31 -0.85**	Ang-Out v CD8	-0.10 0.41* -0.75**

Conclusions: Both anger-in and anger-out were associated with fewer CD4 and greater CD8 cells in the HIV+ groups. Furthermore, anger-out was associated with lymphocyte function. The expression of anger may be an important variable for longitudinal studies of psychosocial effects in AIDS.

D.715

PSYCHOLOGICAL ASSESSMENT OF MINORITY WOMEN
AT RISK FOR AIDS: A PSYCHOMETRIC PILOT STUDY
KROHNE, GAIL, AND LASTERAS, J.

*University of California, Los Angeles, U.S.A., **University of California, Los Angeles, U.S.A.

Objective: A pilot study to describe the psychometric evaluation of several instruments designed to assess the major stresses experienced, the coping responses used, the factors affecting these responses and psychological outcomes with 70 minority drug abusing and homeless women.

Methods: Reliability, content, convergent and divergent validity was assessed on the following instruments: Inventory of Current Concerns, Coping Scale, Social Support Questionnaire, Profile of Mood States, Social Self Esteem Inventory and Locus of Control Scales.

Results: Factor analysis isolated five dimensions which accounted for 72% of the variance. These dimensions included Emotional Distress, Coping Responses, Social Support Perceived as Useful, Situational Attributions and Personal Attributions. The alpha reliability coefficient for all subscales was .82. Content convergent and divergent validity was established. Contrasting groups analysis on a small sample of low-risk women indicated statistically significant differences in the majority of subscales assessed.

Conclusions: The psychometric investigation of instruments which provide a multidimensional approach to assessing coping and psychological adjustment of minority women at risk for HIV infection can enhance the assurance that subsequent screening interventions are implemented based on reliable and valid information.

D.714

PSYCHOLOGICAL IMPLICATIONS AMONG PATIENTS WHEN RECEIVING ANTI HIV POSITIVE
MARQUES, K.M., FONTANA, M.A., SIOUVEAU, S.G.E., ROSSETI, G., LIMA, M.F.J.S., BELLISSA, S.B.E., AND
CENTRO CORSAI (CCIC), CAMPINAS, SÃO PAULO, BRAZIL

In the holistic vision of the work with patients HIV positive, the Psychology division has been developing a global work that has its aim in the patients emotional stability and better quality of life. This approach, plus a therapy that helped the patient to receive the positive results from HIV test, allowed us the conclusion that when working established stages, there are no reactions such as suicide, psychiatric hearing and deliberate intention to transmit the virus like it is shown by the press. Observed among 82 patients in this case from the initial shock with responses such as effective cry or psychological numbness (emotional blocking), having perceptions interlaced with: improper thoughts, emotions generated by events and fixation of non-resolved situations. Having as reaction continuous anxiety or disphoria and showing as a constant a necessity of affective integration. We also notice that these patients show difficulty to have the correct understand of being an asymptomatic carrying of the virus but by not being sick. These patients when working properly will modify internally their state of shock.

THE AIDS DEMENTIA COMPLEX (ADC) AND IMPAIRMENTS OF
AMBULATORY ACTIVITY

REILLY, JOHN S., TRYON, W.W., BROW, S.J., SAEGER, A.E., ARONOW, H.A., PRICE, D.A., SIGELIS, J.J., AND
* Memorial Sloan-Kettering Cancer Center, NY, NY, USA; ** Fordham University, Bronx, NY, USA.

Objective: To assess the relationship between symptoms of the AIDS dementia complex (ADC) and decrements in overall ambulatory activity.

Methods: 16 HIV-1 infected patients with early symptoms of the ADC were evaluated with the Neuro-AIDS Study Group neurological history, examination and neuropsychological (NP) battery. Each then wore a 2" x 3" electronic motion detector (Actigraph (TM); Ambulatory Monitoring Inc., Ardsley, NY) on the waist continuously for a period of 7 days. Minute-to-minute recordings of waist movements greater than 0.1 G were obtained.

Results: Subjects with abnormal reflexes and limb incoordination showed lower levels of overall ambulatory activity (1-54, df=14, p=0.7), as did those with marked abnormality of either smooth pursuit or saccadic eye movements (1-27, df=14, p=0.2). The number of these abnormalities correlated significantly with decrements in activity (r=-.60, p=0.1). NP tests assessing speed of planned, coordinated motor movement were also correlated with activity level (time gait, r=-.54; Trail Making A, r=-.52, and B, r=-.55; Grooved Pegboard dominant, r=-.49 non-dominant, r=-.34, p<0.05), but self-ratings of both mood and psychiatric symptomatology were not.

Conclusions: Analysis of this initial sample of ADC patients indicates that activity decreases markedly as motor control becomes impaired. A more detailed analysis of 24-hour variability in activity is currently in progress on a larger sample, to further investigate these relationships.

IMPACT DE L'ATTITUDE DES SOIGNANTS SUR L'ETAT PSYCHOLOGIQUE DES PATIENTS ATTEINTS DU SIDA.

Courcyer, C.*; de Montigny, J.**; Charpentier, S.***
* Infirmière, Hôpital Hôtel-Dieu, Montréal, Québec, Canada;
** Psychologue en pratique privée, Montréal, Québec, Canada;
*** Personne atteinte du sida, Montréal, Québec, Canada.

Dans le but de saisir l'influence des attitudes des soignants sur l'évolution physique et psychologique des sidéens, un échange entre infirmière, psychologue et personne atteinte du sida sera animé autour de la question de la perception, de la signification d'une maladie terminale tant pour les patients que pour les soignants. L'analyse des réactions individuelles et collectives nous permettra d'évaluer l'ampleur des mécanismes de défense contre la peur d'une mort transmissible.

L'approche systématique préconisée vise essentiellement à explorer les besoins de sollicitude, de compassion et de contribution entre soignants et patients dans un processus de sur une maladie terminale et à démontrer les bénéfices secondaires d'une attitude humaniste inscrite dans une approche multi (ou inter) disciplinaire comme soulagement de la douleur globale.

LE SOUTIEN PSYCHOLOGIQUE COMME EXERCICE. VERTADIER, Alain. Association AIDES, Comité de Paris, France.

Objectif: Diminuer l'anxiété en enrichissant la "visualisation positive" des personnes séropositives HIV ou malades.

Méthode: Groupe de six à huit personnes dont deux séropositifs. Chaque réunion comporte exercices et échanges d'expériences entre les participants et feedback.

Exercices: relaxation musculaire et mentale, expression graphique (dessins) et rêve éveillé. Thèmes des exercices : les aspects considérés comme négatifs (la mort, la souffrance, la dépendance physique) et les aspects positifs (la résolution des difficultés physiques, mentales et sociales).

Cette méthode modifie la "vision globale du monde" de la personne, de son environnement à travers les organes des sens, les représentations des rôles dans un entourage (médical, familial ou professionnel), les conceptions sur la maladie, la guérison, la santé. Elle invite chaque participant à découvrir sa force intérieure. Nous appliquons cette technique "vision force".

Résultats: Trois groupes, soit 28 personnes; durée d'appropration de la méthode : 4 séances de 4 heures tous les 15 jours. 25 disent utiliser cette méthode seuls en un an après le début des exercices pour mieux gérer des situations difficiles et ont enseigné cette méthode à d'autres.

Conclusion: Cette une approche peut être caractérisée de "formation" (selon l'formation) Il s'agit d'apprendre quelque chose de nouveau. Conseil : cet apprentissage est accompagné).

LE COMPORTEMENT SEXUEL A-T-IL CHANGÉ A CAUSE DU SIDA ? ÉTUDE DANS LA POPULATION NORVÉGIE.

Lousballe R. M., Borge R. M., Bekkevold M., Bekkevold R., Hennig G. E., et al. D. Knaaheia. *
* Ecole de Santé Publique, Université de Kinshasa/Zaire
* Tulseve SPSTU, Oslo, Danemark, N. O., U.S.A.

Objectif: Évaluer les changements dans le comportement sexuel à cause du SIDA au Zaire et à étudier le "contexte".

Méthodes: Les répondants ont été sélectionnés informativement vu les difficultés pour avoir l'information sur les habitudes sexuelles d'une personne utilisant les méthodes traditionnelles d'enquête. Les enquêtes ont été conduites dans les différentes couches socio-économiques du pays. Les répondants ont un voisin ou un ami avec qui le cohabite sans avoir connaissance sur son comportement sexuel. À la fin de cohabiter, l'enquêteur note les informations enregistrées par coquer sur un questionnaire à l'issue du répondant.

Résultats: Sur les quelques cas vus, les tendances semblent refléter la situation telle que connue empiriquement dans le parler quotidien des gens. Les filles non-mariées ont tendance de réduire le nombre de partenaires sexuels. Les hommes (marisés et non-mariés) ont tendance de plus en plus des condomes.

Conclusion: Ces résultats préliminaires suggèrent que la population au Zaire est un terrain de changer au comportement sexuelles. Ceci se fait qu'accroître notre optimisme dans le grand combat pour vaincre le fléau du SIDA.

D.718

IMPACT PSYCHOLOGIQUE DU SIDA ET STRATEGIES D'INTERVENTION APRES DES SIDÉENS.

de Montigny, Johanne, M.Ps. Psychologue en pratique privée, Montréal, Québec, Canada et Consultante en psychologie au Comité Sida Aïdes Montréal (CSAM).

Les données cliniques présentées visent à analyser et à évaluer l'impact des réactions psychologiques chez des patients atteints d'une maladie terminale afin de permettre l'élaboration de stratégies d'adaptation à la situation paradoxale de survivre à la menace d'une mort imminente.

Par le biais d'exemples de cas cliniques suivie en bureau privé, à domicile et à l'hôpital, on pourra montrer les méthodes d'approche et élaborer un modèle d'intervention adapté aux étapes évolutives entre le diagnostic, le pronostic et la phase terminale de vie. Il sera question des particularités entre les catégories individuelles et de groupes ainsi que des particularités entre les groupes de personnes atteintes du sida, de personnes séropositives et des proches de ces deux groupes.

Les éléments de contenu tentent de clarifier le rôle du psychologue et l'importance d'autres professionnels et/ou intervenants face à la problématique psychologique du sida.

SEXUAL DEVELOPMENT AND THE SERO-POSITIVE GAY MALE

Marcotte, Glen* Valentic, M.**

*AIDS Calgary, Calgary, Alberta Canada. **The University of Calgary, Alberta, Canada.

Objective: To describe the impact of sero-conversion upon the sexual development of the gay male. Implications for the involvement of social work are discussed.

Method: A literature review and intensive, unstructured interviews with 3 Western Canadian sero-positive gay males. Additionally, the senior author draws on background knowledge gained while working with an AIDS community group.

Results: The use of the Eriksonian developmental schema and Marcia's identity status model were found to be useful in understanding the concurrence of thanatos and eros. After a positive diagnosis, the sero-converted gay male seeks to resolve these essential forces representing the end and beginning of life. The integrity vs. despair crisis is brought forward into early adulthood. Issues related to identity achievement and intimacy are also discussed.

Conclusion: Sero-conversion impacts seriously on the sexual development of gay males. Social work and other helping professions require knowledge of the gay male's developmental dilemmas as well as the norms of the gay subculture. Dialogue between sero-converted gay males and the social work profession may result in more effective clinical social work service as well as better designed and implemented community-focused services. Social work can take a leading role in destigmatizing and diffusing the health crisis and bridging the private need for confidentiality and the public issue of quarantining.

D.722

FREQUENCY OF SEXUAL INTERCOURSE ACCORDING TO MARITAL STATUS IN THE GENERAL POPULATION.

Per Mønstad, H. Østrem, J.W. Olsen, J.E. Gemeny, L.S. Bakker, Department of Epidemiology, National Institute of Public Health, Oslo, Norway.

Objective: To understand the potential for HIV spread in the general population, empirical data on sexual behavior are needed. We present data on the relative frequency of sexual intercourse in heterosexual relationships with respect to present marital status.

Method: The results are based on responses to a questionnaire on the relative frequency of sexual intercourse in heterosexual relationships with respect to present marital status. A sample of 10,000 Norwegian aged 18 through 60 years. The response rate was 83%. The analysis is restricted to single and married (including cohabiting) subjects reporting heterosexual activity during the past year. The dependent variable is the mean number of intercourse in the past month according to own and his/her partners present marital status, regardless of number of partners.

Results: The mean number of intercourse per month was 4.3 for singles whose last partner also was single (N=408), and 5.0 for the last partner was a married person (N=46). Married subjects with extramarital partners during the past year reports a monthly frequency of 6.7 with spouses (N=279), and 1.7 with extramarital partners when the last partner was single (N=123) and 1.3 when the last partner was married (N=140). Married subjects without extramarital affairs in the past year reports a frequency of 7.0 (N=747). The present data elucidate patterns of sexual activity and may be used as data input in mathematical models for understanding and predicting the HIV-epidemic.

SEXUAL PRACTICES AND HIV INFECTION IN SOME ZAMBIAN PRISONS
Mubumba, J., Simonyo, O., Hira, O., Chifwamba, P. (Zambia, ZWI);
Mukonyandela, M* et al.

*Tropical Diseases Research Centre, Harare, Zambia; **University Teaching Hosp., Lusaka, Zambia; ***Unifomed Services University of Health Sciences, Bethesda.

Objectives: 1. To establish seroprevalence of HIV infection among inmates in 3 urban prisons in Zambia. 2. To study their sexual practices.
Methods: All inmates who had been in prisons for atleast 3 months were enrolled in the study and their clinical, social and sexual information was collected. Serum samples were assessed for HIV-1 antibodies using ELISA (Abbott) and those tested positive were confirmed using Recombigen (Genzyme) and immunofluorescent assay. In Lusaka, rectal smears were taken from prisoners and controls (STD clinic attendees) for gonorrhoeal cultures.
Results: The overall HIV-1 seroprevalence was 256 (16.1%) of 1593 prisoners and 28% were visited among the prisoners.

Prison	HIV prevalence %	Homosexuality %
Mukoboko Makumbo	9.2	13.8
Mukoboko Makumbo	15.2	12.3
Kanfinsa Kabwe	14.8	18.2
Lusaka Central	29.0	4.7
Lusaka Remand	19.8	0.0

The overall prevalence of homosexual activity was in 203 (12.7%) of 1668 inmates. 15 (9.6%) of rectal smears taken from prisoners were positive for gonorrhoeal cultures while none of the smears from control men were positive.
Conclusion: HIV infection is prevalent among inmates in some Zambian prisons and homosexuality exists under deprived sexual conditions.

D.725

ALCOHOL AND HIV DISEASE PROGRESSION IN INTRAVENOUS DRUG
ABUSERS.

Lake-Balmer, C. and Rao, R.S. SERV-Health Science Center, Brooklyn, N.Y.

Alcohol weakens ego controls and is lymphocytotoxic. It might therefore increase the risk of exposure to HIV as well as accelerate disease progression.
Objective: To evaluate the effect of alcohol on the rate of HIV infection and on HIV disease progression.
Methods: Alcohol history evaluated prospectively in 201 IVDA using a questionnaire. Good correlation with CD4 response, acute CRP levels and repeat random interviews. HIV antibody detected by repeat ELISA testing (Abbott).

Results:

	HIV negative	HIV positive	AIDS
n	52	106	42
Age (yr) (SD)	35 (6.7)	35 (6.8)	36 (6.4)
Female	30 (58%)	33 (31%)	13 (31%)
Alcohol			
(40g/d and over)	24 (46.3%)	63 (60.4%)	36 (85.7%)

Alcohol abuse is significantly greater in AIDS than non-AIDS IVDA (p = 0.016; Fisher's exact test). In contrast there is no significant difference in alcohol use between HIV negative and HIV positive patients (p = 0.05).

Conclusion: Alcohol does not significantly increase the risk of HIV exposure but may affect the rate of progression of disease in HIV positive subjects.

Overview of WHO/UNESCO experience in initiating school health education programmes to prevent AIDS and other STDs.

Keywords: AIDS; School; STD.

*UNESCO Education for the Prevention of AIDS Programme, UNESCO Paris; **World Health Organization, Education Systems Specialist, Health Promotion Unit, Geneva

The National AIDS Plans of developing countries will be analysed with a view of identifying the extent to which they include formal school AIDS education programmes; the dimensions of the problem these programmes are intended to address; and the essential needs, if any, that have been obtained by these programmes up to date.

In parallel with the above study, the AIDS-education materials available at the WHO/UNESCO School AIDS Education Resource Centre (WHOED, Paris), and addressed, in particular, to students, teachers, school authorities, and parents, will be reviewed and a critical and comparative analysis of their approaches to AIDS education content; and teaching/learning strategies and methodologies, will be presented, along with sample illustrative materials.

M.E.O.13 AIDS AND THE FAMILY
Roy, Robert; Miller, R.; Goldman, E.; Johnson, M.; Lee, C.; **Kennedy, J.**
Royal Free Hospital and School of Medicine, London, England.

Objective: To describe the impact of AIDS on families presenting for counselling in a London Teaching Hospital over a four-year period (1986 - 1989).
Method: Families have been interviewed in different hospital units (Thompson, S.T.D., AIDS Counselling, Casualty, Medical Units) over a period of four years. The "Nolan Method" of family therapy has guided the interview approach. Families have been seen at all stages: from the time of diagnosis of an individual; to the period of bereavement. Two thousand interviews have been conducted. Common themes have been recorded.
Results: AIDS is a potentially powerful source of stress on relationships between family members and on the family and other social systems. It exacerbates existing relationship difficulties and leads to new problems over 40 common themes emerged from these interviews. These related to (a) dynamics within the family (20); (b) stresses in the structure of the family (6); (c) problems in the family after someone has died from AIDS (5); and (d) (5); (c) problems in the family and other social systems (10).
Conclusion: AIDS has a profound effect not only on the HIV-infected individual but also on his or her relationships with others. This includes increased stresses within the biological family and the family of affiliation. Counselling approaches which address these may help to reduce psychiatric morbidity in the survivors.

M.E.O.15

THE DEVELOPMENTAL AND FAMILY SERVICES UNIT - A MODEL AIDS PROJECT SERVING ENVIRONMENTALLY DISABLED CHILDREN AND THEIR FAMILIES
Eliason, Karen Green, J.
Albert Einstein College of Medicine, Yeshiva Univ., Bronx, New York, USA

Objective: To assess the developmental needs of HIV infected children to provide rehabilitative and psychosocial services in order to improve the quality of life by optimizing developmental functioning.

Method: This paper describes a model pediatric program that uses a multi-disciplinary team to assess the developmental and psychosocial needs of HIV infected children and their families. The unit includes developmental pediatrician, social workers, psychologist, a medical educator, physician and occupational, physical and language therapists, each of whom perform complete evaluations. The weekly multi-disciplinary conference results in the formulation of an Individual Family Service Plan (IFSP) for each child and his family.

Results: 30 children and their families have been evaluated and are in the program. Family composition were non-traditional and varied. The diagnostic and rehabilitative needs differed as well. The most frequently required services were occupational therapy and psychosocial intervention to increase parental coping skills in handling environmentally disabled, chronically ill children.

Conclusions: Children who are HIV+ are being longer and will have serious deficits. The need to develop services to address the unique developmental and psychosocial needs of these children and their families is paramount.

M.E.O.17

MULTI-PROFESSIONAL EXPERIENCE WITH HIV INFECTED PATIENTS' FAMILIES
MORRIS GROUP IN RIO DE JANEIRO, BRAZIL
Waller, M.A.M.; Cavalcanti, M.L.; Lins, D.F.; Neri, J.A.L.; Lopes, P.A.P.;
Nardi, G.; Lorenço, M.C.; Neri, G. de S., C.A.
Debrife e Saúde Universitária, Universidade de Rio de Janeiro (UNIRIO) - Brazil.

Objectives:

- 1) to inform family members of HIV infected individuals about transmission/prevention and follow up of the patient;
- 2) to give emotional support;
- 3) to stimulate family members and friends to participate in the Social and Health Policies in Brazil.

Methods: Since July 1987 when it started, the study group included psychologists, two social workers and an (RN) doctor that meet weekly for one and half an hour with family members and friends of our patients. During this time period 60 family members and friends of 36 patients were included. Eleven family members continue to participate on the study group even after their patients' death.

Results: Among the 60 family members and friends followed, including those who came exclusively for information, 56 (93%) could meet better with the difficulties of living with an infected person, in 48 (80%) it was observed a clear decrease in the anxiety and depression process. Finally in October 1988, 5 (8%) decided to organize an Association Group of family members of AIDS patients in Rio de Janeiro to discuss and fight against negative situations generated by the AIDS.

Conclusions: The objectives were achieved notwithstanding the numerous social stigmas of AIDS. The preliminary results suggest that it is possible to extend this experience to other hospitals or centers with AIDS care, as happened in 1988 when doctors from other states of Brazil came for training on AIDS care practices on the group and felt the importance of the experience.

M.E.O.14 GAY MEN WITH AIDS: FAMILY OF CHOICE VS. FAMILY OF ORIGIN
Patton, John A.; Walker, G. et al. with Ackerman Institute
for Family Therapy, New York, New York, USA

Objective: A gay man diagnosed with AIDS needs to resolve the disjunction between his gay partnership and friends and his family of origin.
Description: Gay people, in order to establish a gay identity in accord with their sexual orientation, frequently leave their family of origin and sustain long-term cut-offs while establishing a gay family of choice which may or may not include a long-term partnership. When the gay man is diagnosed with AIDS, he often feels a need to resolve this disjunction. His desire or attempt to reconnect to the family of origin may create intense stress as the gay person reenters a world which can retrovise longstanding internalized conflicts. This stress may generate vulnerability to increased illness. The workshop will deal with the delicate balance between forging reconnections and maintaining gay identity in the face of life-threatening illness and will include a discussion of issues of gay identity, sources of work and how values of origin to create bridges between parents and gay children with the gay couples when one partner makes a decision to reconnect with his original family. The area of reconnection requires a high degree of clinical sophistication and extensive knowledge of gay issues. The workshop will analyze the dangers as well as the possibilities for success in reconnection. Videotape excerpts from *Stages of Illness*, an Ackerman AIDS training case, will be used to illustrate themes.
Conclusion: Psychotherapeutic understanding and themes can significantly help in the area of reconnection to family of origin.

M.E.O.16

Effectiveness of a Support Group with Families of HIV Infected Children: A One Year Follow-up
"I Can't Forget", A. Sussman** M. Berthoud** A. Souders*** F. Cascellini** "Kings County Hosp. Bklyn, NY, USA.

**NIH Health Science Center at Brooklyn, Bklyn, NY, USA
***Brooklyn, NY, USA

Objective: To examine the effectiveness of a weekly support group for the caregivers of HIV infected children in 1) reducing social isolation and depression, 2) increasing self esteem and education regarding HIV, and 3) developing a support network.

Method: This report describes the group's development over a 1 year period (6 sessions). 31 families of 36 HIV infected children were invited to attend the weekly support group held in an urban hospital. Participants are referred by staff and by group members. Members include parents, grandparents, and foster parents. Two social workers, a physician assistant and a psychiatric resident facilitate the group while a third social worker leads a children's play group concurrently. Traditional group psychotherapy techniques are utilized.

Results: Groups size ranged from 3 to 15 participants. The average number of participants increased from 8 to 12. Seropositive mothers who acquired HIV behaviorally comprise the largest subgroup. They also attended most frequently. Males failed to attend or remain in the group. Themes such as members' concerns about their health, sexuality and relationships and struggles with being single parents emerged. With time, these women came to focus more on their own emotional struggles and issues and less on more practical concerns of the care of their children. Members attended funerals and visited grieving families at the time of the death of children. They also celebrated the children's birthdays and went on group outings.

Conclusions: A support group for the families of HIV infected children was found to help them cope with the stress and pain of pediatric AIDS. Seropositive mothers demonstrated the greatest need and interest in this intervention. The authors restate their recommendation that this activity be an integral part of comprehensive care.

SAMU-Stepping AIDS is My Mission-A Minority Adolescent AIDS Education Program.

Carroll, V.J., Assistant Professor of Medicine, University Hospitals of Cleveland, 2074 Abington Road, Cleveland, Ohio 44106. 216-844-3778

SAMU is a two year old minority adolescent AIDS education program. Targeted to predominantly black adolescents at risk, SAMU uses peer pressure to provide a supportive environment to maintain safer behaviors. Founded on volunteerism, SAMU utilizes community persons, black health and paraprofessional professionals, and adolescents to provide AIDS education. Sites are not limited to schools, but rather target adolescents at community centers, detention houses, and Job Corps. Education is provided in a nonjudgmental style, using familiar street terms, as well as black adolescent lingo. Slides of black persons in various stages of HIV infection are also used. In addition to the panel of black PAsas/PNAs/HIV positives who interact with the teens and answer questions. At the end of each session is a social event (dance when permitted), where the SAMU volunteers as well as the disc jockey serve as undercover AIDS educators. By providing free tea, coffee, refreshments and entertainment, SAMU's message is not only to stay safe but to be proud. We believe that our teens are each unique valued individuals. AIDS education in our format is linked to self-respect and empowerment.

M.E.O.20

Triple Jeopardy - Reaching Ethnic and Racial Minority Youth who are Gay - Identified and/or IV Drug Users

Osley, Jacob A., Kent State University
American School Health Association, Kent, Ohio, USA.

American youth are identified as one of the most waves of individuals greatest at risk for HIV infection. Black and Hispanic youth are of special concern regarding increased incidences of HIV infection due to disproportionate HIV antibody seropositivity rates in these racial and ethnic groups. Furthermore, those "minority" youth who are intravenous drug users and/or homosexually active (gay or bisexual) may be at even greater risk because of practices often associated with these identified with reaching either "minority" youth or gay/drug-using youth alone. Very few school-based educational initiatives target such youth in particular.

The American School Health Association has developed strategies to train school-based professionals to prepare for the challenges here-described. This presentation will present some of these strategies.

M.E.O.21

AIDS EDUCATION IN COMMUNITIES OF COLOR: HOW DO WE MAKE A DIFFERENCE

Warren, Elizabeth Lorraine. Babashki, Philadelphia PA, USA.

Those individuals most at risk for HIV infection are also most at risk for a cadre of other maladies which have not as yet been sufficiently addressed in the past by health education. Heart disease, diabetes, hypertension, unplanned adolescent pregnancy infant mortality, all have been addressed in health education targeted toward poor, under educated people of color with very little success. AIDS education can not be successful in altering behavior without defining cultural sensitivity, recognizing cultural mores, consideration of language and cultural/ethnic communications.

A model of education will be presented which incorporates the principals of education blended with the realities of cultural influences. The "how to's" of accessing the community needs, targeting specific populations and developing realistic education and service programs will be highlighted.

M.E.O.22

INTEGRATING HIV/AIDS INFORMATION

INTO SCHOOL HEALTH EDUCATION FOR MINORITY STUDENTS
Warren, Ruben C. Centers for Disease Control

Atlanta, Georgia, U.S.A.
Health education has been taught in the public school system for many years. Unfortunately, strategies to assure relevant and meaningful information have been limited. In fact, such of the school curricula, in general, serve as a barrier rather than an enabler to learning for minority students.

Minority and/or low income students often have limited financial and/or geographical access to health care. Consequently, health issues are low on the priority scale for many of these students. Therefore, innovative models are needed if school health education is expected to influence the knowledge, attitudes, or behaviors of minority students. This presentation focuses on integrating HIV/AIDS information into a health education model for minority students. Emphasis will focus on the students' health goals, other conflicting goals, and competing values and beliefs. Recommendations will be made to assure that the health message are relevant to the total life circumstances of the students. The relationship between knowledge, attitude, and behavior will also be reviewed.

M.E.O.23

AIDS AND MINORITIES: STRATEGIES FOR PREVENTION

Dumphy, James K. Fraser-Hovde, Debra; & Lopez, Mary Louise
RICA Leadership Commission on AIDS, New York, NY, USA

Objective: To pose innovative approaches to reduce AIDS-related risks of poverty, addiction and educational attainment, and therefore the risk of AIDS. **View and structure:** Operations of aid and financial support to municipal hospitals in urban centers overreached by minorities with AIDS. **Development of culturally-sensitive approaches to adolescents to reduce experimentation with "unsafe" sex and drugs:** 1. Focus on the sub of the epidemic of adolescent childbearing age and their infants-with a high-saturation education/prevention campaign. 2. Focus on the IV drug abusing population, the majority of which is Black and Hispanic, and provide new and radical outreach programs. **Message:** Currently, in New York City, the Black Leadership Commission on AIDS has mobilized and now is advising the city, state and federal health systems. **RICA programs are now seeking funding for adolescent outreach and education/prevention centers for African-Americans.** **Conclusion:** The belief is increasing among African-Americans in the U.S. that AIDS was introduced into this community by outside forces in an attempt to kill off the race. This view of biological genocide is a serious barrier to the implementation of AIDS prevention efforts by governmental, health care and educational systems which are not treated by minority communities. The way to correct this situation is to utilize minority leadership in decision-making, correct this situation in direct service. By placing special culturally-sensitive concentration on minority men of childbearing age, their infants, IV drug abusers and adolescents teaching the age of sexual and drug experimentation, prevention can attain some success. Only the full and active participation of minority leaders in all systems can make this possible.

Table ronde Round Table

Le SIDA, la société et le comportement

L'entraide : Une stratégie d'adaptation

Self-Help: A Coping Strategy

M.E.O.24 SELF HELP GROUPS AND THE AIDS PATIENTS
HEIDER BLITZKE

Canadian Council on Social Development, Ottawa, Canada.
There is a scarcity of evidence showing the AIDS Community is fully aware of the potentials of the self-help group model in dealing with many personal, emotional and social problems the condition gives rise to. This session will present a range of possibilities the self-help group model offers AIDS patients, their families and their friends.

Also treated will be the gains the AIDS Community can draw from associating with the Self Help Community as well as the contributions the AIDS Community can make to it. The reasons why the AIDS Community does not work closely with the established centers such as Self Help Clearinghouses will be explored.

The work that a number of self help groups with an advocacy agenda will be presented with the view of exploring both the applicability of such an option for AIDS Patients and the strategies groups have used in dealing with specific concerns.

M.E.O.25 SELF-HELP: A PERSONAL PERSPECTIVE
Kowalski, Alex. Vancouver Person's with AIDS Society, Vancouver, Canada

M.E.O.26 THE AIDS PREVENTION CONCEPT OF THE GERMAN AIDS-LIFE CO-OPERATIVE MODEL

Van Schöfeg, Hubert Specht, Deutsche AIDS-Hilfe e.V.
Hennrichstr. 7 - 9, 1000 Berlin 31, West-Germany

Objectives: To describe planning, realization and monitoring by a nationwide working non-governmental organization in the Federal Republic of Germany.
Methods: In 1985 non-governmental groups were founded as AIDS-Hilfen in the form of self-help groups. The distance to governmental health authorities was essential for the access to target groups as gays, i.v. drug users and prostitutes (in the sense of anti-discrimination). Successes in an open and explicit language were published. The motto was "if you have a sexual disease you have to talk about sex and sex can still be fun". The acceptance of different kind of lifestyles is another main rule for the successful work of non-governmental organizations. Deutsche AIDS-Hilfe is the umbrella organization now of 80 local counselling centers which are well accepted by target groups and the general public. **Results:** Continuous discussion, expert meetings and feedback by people with AIDS/HIV and members of target groups led to promising results in risk reduction and social acceptance of people with HIV and AIDS. **Conclusion:** To reach specific target groups you need a specific language especially for discriminated minorities. A non-governmental organization seems to be the best educational partner.

M.E.O.27 THE DIFFICULTIES OF FWA COALITIONS IN PROVIDING SERVICES TO ACTIVE DRUG MISUSERS

Mordant, John. London Lighthouse, United Kingdom.

M.E.O.28 PHYSICIANS SELF SUPPORT GROUP
Chastagnier, Michel/Ville Marie Social Service Centre, Montréal, Québec, Canada.

Under the auspices of Comité SIDA Aids Montréal I have been facilitating for the past 6 months a self-support group for physicians who have a significant proportion of people with AIDS as patients.
I will present the difficulties in getting such a group off the ground and attempting to keep it focused on meeting some of the emotional and educational needs of the participants, issues such as the following will be addressed: the alleged reluctance of physicians to share their feelings; the difficulties in exercising leadership amongst a group of highly autonomous professionals; emotional impacts of having a large practice of people with AIDS.

T.E.0.1

NEW YORK STATE'S RESPONSE TO AIDS: A ROAD MAP FOR HUMAN SERVICES

PRESENTERS: Cesar A. Perales, Commissioner, NYS Department of Social Services; Barbara J. Sahn, Executive Deputy Commissioner, NYSDSS; Jeffrey L. Carlles, Deputy Commissioner, NYSDSS; Nicholas A. Bagnio, M.D., Director, AIDS Institute, NYS Department of Health; and Dennis P. Kahan, Deputy Director, NYS Division of Substance Abuse Services, New York, NY, U.S.A.

This forum will describe the development and operation of New York State's (NYS) integrated network of health and human services for people with AIDS, and will suggest ways to establish similar interagency systems in other places. Approximately 20,000 AIDS cases were reported to NYS by January 1989, including a growing number of cases among women and children. The overall numbers are expected to rise to 90,000 by 1995, requiring a significant expansion in health and human services. In this forum, representatives of three NYS public agencies will discuss the coordinated human services model that serves the needs of thousands of individuals and families with HIV-1/2. HIV has afflicted a diverse population in NYS. State agencies provide a continuum of care that meets the differing needs of gay men, ID-drug users, individuals and families, women and children, adolescents, minority and non-minority groups, the homeless, urban and rural dwellers. Governor Mario Cuomo's Five Year Plan (to be given to participants) outlines the requirements for case management and provision of medical, non-medical, and substance-abuse services. Panelists will describe the system of Designated AIDS Care Centers; child foster care programs, such as Leake and Watts; health-related facilities for substance-abuse treatment; shelters for homeless people with AIDS, and other programs. They will also highlight unresolved issues and challenges.

T.E.0.4

OBSTACLES TO USE OF PUBLIC SOCIAL SERVICES AND WORKERS IN AIDS PREVENTION AND CONTROL PROGRAMMES
Keywords: *Lloyd*, G, Tulane University, New Orleans, LA USA

Objective: To assess potential weaknesses of training workers in the public social services for prevention education and casefinding in AIDS prevention and control programs, and to identify obstacles to such efforts. **Methods:** Informal discussions were held with trainers and supervisors in public social services in six settings-two each in Patterns I, II and III areas. **Results:** Although public social services offer a pool of workers with some degree of training in counseling or education, obstacles and constraints in both developed and developing countries seriously restrict adding roles/functions related to HIV/AIDS. Public social services are almost universally: (a) accorded low status; (b) prone to high personnel turnover; (c) subject to chronic mismatch of service demand and resources; (d) apt to narrowly define problem areas and restrict clientele; (e) operate in rigid hierarchical structures; and (f) vulnerable to political interference. Taken altogether, these variables are powerful obstacles in the way of training and using public social service workers for carrying out additional tasks related to AIDS prevention and control. Additionally, in many places, workers see any AIDS-related activity as intensifying the stigma or low status of their work and resist training. **Conclusions:** Training existing public social service personnel for roles in AIDS prevention and control programs may be more expensive and less effective than recruiting and training personnel in new HIV/AIDS-specific public social service agencies.

T.E.O.7 INTRODUCTION
Lapointe, Bernard.

T.E.O.8 PLUS, AN ORGANIZATION OF BODY POSITIVES IN NORMAN ENCON-
PASSING ALL GROUPS.

Arne N. Huseid, Sylvia Kabbak, the board of Plus and members, Oslo, Norway

Objective: Having an active organization, unlike compared to similar groups throughout the world, we would like to present our ideas, our achievements so far and our methods and aims.

Methods: Positives must fight two major evils, the virus and the difficult ENVIRONMENT. Both evils seem extremely to conquer, but they are related and not impossible. Many people, experts and humanists fight with us, but there are no recipes for either way; towards getting well or creating Justice. Nobody can fight better than positives. In Norway we fight along with the government and we are supported by the official institutions and other organizations. But just as important is our independence. In Plus, positives support each others, we offer alternative treatments, we consider information vital for each individual and we stand forward and exhibit ourselves to show force of will of living - as we also have to fight public fear, prejudice and discrimination.

Results: It is too early to present a complete evaluation. But already we have become an important supplement for each individual member, to the traditional health and social services and to the society. We keep in touch with all primary health stations and hospitals throughout the country. We have 170 members (equals 25 per cent of all registered positives). By June we will be able to present more results.

T.E.O.9 Michel Gallo, AIDES, Fédération Nationale,
Paris, France

T.E.O.10 THE ROLE OF AIDS SERVICE ORGANIZATIONS IN DEVELOPING
PUBLIC HEALTH POLICY AND SERVICES FOR HIV DISEASE.
Hynes, James E.* Philadelphia Department of Public
Health, AIDS Activities Coordinating Office, Philadelphia, Pa.
This presentation will present a model of a large urban
Health Department interfacing with AIDS Service Organizations
(ASOs) in the provision of education and direct services to com-
munities and individuals with HIV disease. These various pro-
grams will include: prevention activities, HIV testing and
counseling, coordination of service delivery, and policy and
planning. The Philadelphia Department of Public Health is
unique. The AIDS Activities Coordinating Office (AACO) is a
comprehensive department defined as a separate entity. All
services mandated under the aegis of public health exists with
AACO (Surveillance, Prevention, Policy and Planning, and Service
Delivery). An additional component, AIDS Agency Services Unit,
combines all of the above functions on a contractual basis
through ASOs. These ASOs serve as active participants in their
role as conduits for effective public health activities within
the local communities. This level of involvement empowers the
larger community to address its own needs rather than through a
select group of bureaucrats defining the community needs. This
presentation will provide a model for ASOs to impact the local
department of health for the enhancement of AIDS resources,
services, and policy development. ASOs who are beginning or
having difficulty with local health authorities will be given a
model to work more effectively with local authorities.

T.E.O.11 INFORMATION FOR EMPOWERMENT
DeLaney, Martin. Project Inform, USA.

T.E.O.12 THE LEARNING ABOUT AIDS PROJECT - A PARTICIPATORY APPROACH TO
HEALTH EDUCATION ABOUT HIV INFECTION AND AIDS
Peter Aggleton, Department of Education, Bristol Polytechnic
Bristol, England

Objectives - To identify a rationale for participatory education about HIV and AIDS and to describe the processes of development, dissemination and evaluation on the Learning about AIDS project.

Methods - The Learning about AIDS project is a national project developing and disseminating innovative health education materials for use in adult education about AIDS. Interim materials were disseminated by the Health Education Authority in 1987, and a considerably enhanced revised package will be published in February 1989. A major dissemination of these materials has commenced in the 16 health regions in England involving health educators and trainers working in the health service, in education, in social services and in the voluntary sector.

This paper will identify a rationale for participatory education based on group work and describe the manner in which learning about AIDS materials were developed. It discusses the value of such an approach in fostering self-empowerment, community development and social change. The dissemination strategy will be described as well as the steps that have been taken to use process and product evaluation to assess the outcomes of the project.

W.E.O.7 COMMUNITY ORGANIZATION FOR HIV PREVENTION:
PROGRAMS AND PRIORITIES OF THE CENTERS FOR
DISEASE CONTROL

Callit, K.A., Brown, J.J., Johnson, S.M., et al. *Centers for
Disease Control (CDC), Atlanta, GA, U.S.A.
*United States Conference of Mayors, District of Columbia, U.S.A.

Objectif: To provide financial and technical assistance to
COMMUNITY-based organizations (CBO) to carry out HIV prevention
programs targeted to individuals whose behavior places them at
increased risk.

Méthode: CDC, in cooperation with State and local health
departments, the U.S. Conference of Mayors, national and regional
organizations has begun a financial and technical assistance program
to assist CBO (especially those that represent and serve minority
populations) to plan, implement, and evaluate HIV prevention
activities which meet the needs of local communities. Financial and
technical assistance are provided through closely-monitored CDC
cooperative agreements.

Résumé: Since 1987, over \$50 million has been awarded to more than
200 cities throughout the U.S. for HIV prevention programs and
activities. The U.S. Conference of Mayors has also awarded CDC
funds of over \$2.5 million to 8 CBOs. CDC has begun an additional
program of direct assistance to CBOs in the form of grants aimed
at HIV. Collaboration and coordination among health departments and
private organizations involved in HIV prevention have increased as a
direct result.

CONCLUSIONS: CDC has established several mechanisms for providing
financial and technical assistance to CBOs. The authors will
provide an overview of the national program, report on experience to
date, discuss technical assistance and other needs of community
organizations, and discuss problems and issues relevant to
implementation and evaluation of such programs.

**La lutte communautaire contre le SIDA dans les années 1990
The Community-Based Response to AIDS into the 1990s**

W.E.O.8 ROLE OF COMMUNITY BASED ORGANISATIONS IN THE AUSTRALIAN RESPONSE TO AIDS
Whittaker, Bill*

*Australian Federation of AIDS Organisations, Australia

Objective: To discuss the development of the community response to AIDS in Australia, into the achievement and difficulties encountered. Comparisons will be made between the Australian response and initiatives in other countries. The challenges of developing a community response to AIDS in Asian, African and other regional countries using aspects of the Australian model will be examined.

Discussion: Community based AIDS organisations have played a vital role in Australia's response to AIDS. The Australian community response is one of the most successful in the world. Each Australian State has established an AIDS Council, which are volunteer oriented community based organisations. These Councils provide AIDS education, support services and advocacy on key issues. The Australian AIDS Councils have in turn set up a peak body called the Australian Federation of AIDS Organisations. Australia is now at the point where special AIDS education programs and support services for those affected by AIDS are required outside principal cities. This is presenting new challenges for community organizations in overcoming geographical problems and limited human and financial resources.

W.E.O.9 THE COMMUNITY BASED AIDS RESPONSE IN THE 1990's.

Holm, Jim, National Aids Network, Washington, D.C. USA

The community based response in the United States has been unprecedented. Affected communities provide a continuum of services to care for people living with AIDS and to prevent the spread of HIV. Over 650 community based organizations, receiving a mix of private, public, and individual funding, are either registered with or members of the National Aids Network (NAN). NAN's strategic plan for the 1990's includes an assessment of the community based response. NAN believes no single funding source can provide the necessary support. One necessary step is to replace Federal demonstration projects with a long term commitment to funding prevention and care. However, leaders of the community based response must accept greater responsibility for accountability when seeking such funds. As the epidemic becomes more mainstream, leaders ask why we should expand special resources we don't spend for other diseases. If we do not, the U.S. medical system's infrastructure will be overwhelmed. AIDS will force changes of the system.

W.E.O.10 INNOVATIONS IN HEALTH CARE DELIVERY FOR HIV IMPROVED PRACTICES

Reaslow, Judith B.; Horvater, C.; Horner, M.; Dolowak, G.; Hutchings, J.J. Health Resources and Services Administration, Public Health Service, Department of Health and Human Services, Rockville, Maryland, U.S.A.

Objective: To highlight examples of innovative HIV service related programs developed by grantees of the Health Resources and Services Administration (HRSA) of the U.S. Public Health Service (PHS).
Methods: HRSA is the agency within the USPHS responsible for supporting health care delivery programs for various populations with special needs, including those infected by HIV. Among the HIV service grants awarded to date are 21 service demonstration focusing on improved case management, 13 projects focusing on out of hospital care of children with AIDS, 19 projects designed to provide intermediate and long term care facilities for people with AIDS, and 13 training programs which focus on improving the quality of HIV services delivered by health service providers of various disciplines.

Results: Among the above projects, there are examples of innovative service delivery and training approaches which will be highlighted in this presentation. The value of those selected is the potential for replication in other settings.

Conclusion: Optimal use of public funds is achieved when they are applied to the development of unique, community responsive models of health care delivery, and when such models are made available for application in other settings. While each community's needs are unique, lessons learned from these programs can be applied in others.

W.E.O.12 COMPARATIVE STUDY OF COMMUNITY-BASED AIDS SERVICE DELIVERY
Chagnac, Nancy, McGill Centre for Medicine, Ethics and Law, Montreal, Quebec, Canada

Objective: To describe a comparative survey of community-based AIDS service organizations from Sweden, Holland, Denmark, West Germany, Belgium, France, Norway and Canada.
Methods: An analysis grid was developed and utilized for a comparative review, based on interviews and published reports of the operations and structure of these organizations. The analysis grid permitted both lateral and vertical comparison in all dimensions.
Results: The analysis grid included parameters such as organizational structure, budget, sources of financing, epidemiological circumstances, socio-political climate, case load, programme services delivered, target populations, institutional cooperation, developmental changes and decision-making mechanisms.

Similarities include the common circumstances of rapid development and change, in target populations served and basic services offered (some services were restricted to specific groups or were offered in conjunction with those of other organizations).

Critical distinctions occurred in the areas of use of volunteer labour force, membership decisionary powers, executive disciplinary powers, means and levels of financing, cooperation with other AIDS service organizations, legal and social atmosphere, and level of interaction with public institutions.

Conclusions: Community groups operated more effectively if one or more of the following conditions were met:

1. maintenance of close contact with community infrastructure (their community base);
2. close co-operation with already existing health and welfare networks and with community organizations;
3. adequate and diverse funding arrangements;
4. a social climate of acceptance and/or tolerance around such issues as homosexuality, discussing sexuality and drug use.

Le SIDA dans les médias AIDS in the Media

W.E.O.20 MEDIA AIDS EDUCATION: THE BOMBING EFFECT BOMBARDÉ L'ÉDUCATION À L'ÉDUCATION Concordia University, Montreal, Québec, Canada.

Public resistance to AIDS prevention is becoming increasingly apparent, especially among young people. The use of television and mass media campaigning strategies in this psychological resistance.

Methods. A three-year comparative study of TV and film materials from Africa, Australia, W. America and Europe is reported, using traditional programme evaluation techniques and electronic audience research methods recently developed in the media advertising industry.

Results. The most successful campaigns are those which use hard facts about AIDS in a simple and straightforward manner. Advertising campaigns featuring elaborate, symbolic or melodramatic imagery, or dramatization, are perceived as less effective. The use of television advertising can have a temporary effect on establishing public opinion on the urgency of AIDS and the civil rights of infected persons.

Electronic analysis of moment-by-moment audience reactions to materials are reported, attributing the adverse effects of media AIDS education to poor reporting accuracy or ambiguity of its some cases. A few records only, however, of the use of electronic audience research methods in the media advertising industry. Electronic analysis of moment-by-moment audience reactions to materials are reported, attributing the adverse effects of media AIDS education to poor reporting accuracy or ambiguity of its some cases. A few records only, however, of the use of electronic audience research methods in the media advertising industry.

Electronic analysis of moment-by-moment audience reactions to materials are reported, attributing the adverse effects of media AIDS education to poor reporting accuracy or ambiguity of its some cases. A few records only, however, of the use of electronic audience research methods in the media advertising industry.

W.E.O.22 CORRELATION BETWEEN LARGE SCALE MASS MEDIA CAMPAIGNS OF AIDS PREVENTION AND SUBSEQUENT AIDS TESTING BY RISK PRACTICE IN MADRID

Marín, A. Aguilá, J. P. Ballesteros, C. Baranoso, B. Ballesteros, a Journalist, Universidad Complutense, Madrid, & Doctor, Madrid City Council, Spain

Objective. To know the influence of mass media information campaigns on the HIV risk practices in Madrid.

Methods. Descriptive study of the information on AIDS given by 4 Madrid newspapers, 6 radio stations and 2 TV channels during 1985 and 1987. Study of HIV risk practices among 978 TVDS and 488 homosexuals who were treated at a Health Promotion Center of Madrid City Council.

Results. Press information study shows the information was given in different stages, appearing at the beginning of '85 a greater number of articles (5000 increases) with a much more prominent content compared to those at the beginning of '86, much more alarmist and scientific. By the end of '87 it drops to 400. Risk practices among the groups considered slightly decrease during 1987 among homosexuals; but the use of sterile syringes by IVDS increased 75% during the first semester (March and April) and decreased during the last period of 1987. Information on the amount in which the change of habit took place is 80% coincidental during the first months 1987. The reaction of this group to general mass media information has been 00-00.

Conclusion: Our research shows a correlation between the quantity and quality of the information and the abandon of risk practices, thus confirming the great importance of mass media information on AIDS preventive attitude.

W.E.O.24 PERIODIC RISK AND LACK OF REPRESENTATION OF WOMEN'S CHOICES AND DECISIONS IN THE MEDIA PERIODIC RISK AND LACK OF REPRESENTATION OF WOMEN'S CHOICES AND DECISIONS IN THE MEDIA Rosenfeld, Naomi, Women and AIDS Studies, 710 Mac Don Ave., NY, NY 10025 USA

Objective: To assess the lack of representation of women's groups and experts in the media coverage of AIDS, HIV press reports on two issues that particularly affect women—partner notification and serostatus testing—and to assess the extent to which women's voices are heard in the media coverage of AIDS as sources were also reviewed.

Methods: A content analysis of 108 articles in the New York Times, United States and Canada, representing content press coverage. Collected clippings from 4 AIDS newspapers also constitute representation of the opinions of key groups in this legislation included but not enough persons in NYC would presently be included for prevention efforts directed at black and Hispanic women, the mass clippings do not show that any women's or black or Hispanic groups were used to comment on the adequacy of the legislation. Similarly, in articles covering the general lack of awareness of women in transmission trials, papers as diverse as the NY Times and Village Voice presented the women's opinions of AIDS, male physicians that your, identify women are unrepresentative and lacking "credibility and understanding." Being elderly sought so women's reports as sources, these papers stated the story that the three major NY transmission trials administered by women have had no problem recruiting women patients. A People magazine cover story on women and AIDS in which the 6 experts quoted were all white (and 3 male) and which a gay male Times cover story on partner notification which, again, included only men and reports as sources. Challenge: AIDS coverage which depicts almost exclusively or white males as sources results in generally negative content and in factual error. In some instances, press bias has been so severe it has blocked the thorough public discussion needed for policy formation.

W.E.O.21 LES MEDIAS A L'ÉPREUVE DU SIDA / ANALYSE THÉMATIQUE ET COMPARAISON DE LA PRESSE FRANÇAISE ET AMÉRICAINE. THE MEDIA AT THE TEST OF AIDS / THEMATIC ANALYSIS AND COMPARISON OF FRENCH AND AMERICAN PRESS

Chénief, A. M. Depuis le Mal de Naples, la presse occidentale a vu renaître un thème qui d'origine médiatique, celle d'une maladie mortelle, transmissible par le sang et par le sexe.

Le but de la présente étude est d'analyser sur travers des études diachroniques la façon dont la presse française et américaine a traité le SIDA depuis le 1/01/1986 et le 1/06/1984; une comparaison du nombre d'apparition du thème-SIDA dans 4 quotidiens français entre juillet 1983 et juin 1984; un recensement du nombre d'occurrences du SIDA dans 3 hebdomadaires entre 1982 et 1985; - la spécificité de ce "phénomène médiatique SIDA".

Quatre périodes sont détachées depuis la description par le SIDA de la maladie à 81-82; le mystère 83-84; le "parler science" et la grande époque d'immunologie consumer 85 à l'analyse scientifique. Les camps ont une lecture "sociale" du SIDA; 86-87-88; les années de gestion de la réputation comme de la maladie. Sur quelques 290 articles publiés dans 4 quotidiens français et 70 (240) sont exclusivement consacrés au SIDA, relevant le cancer (9,3%), les procédures médicales (10,2%), les traitements (11,1%) ou les données épidémiologiques. Une comparaison avec les données américaines (W.A. Check & Rev. Inf. Dis. 1987 5: 197-200) permet d'établir une constance dans les liens unissant pressé et SIDA.

Conclusion: Cette revue de presse comparative permet de mesurer le chemin

W.E.O.23 THE UK NATIONAL AIDS HEALTH PROMOTION PROGRAMME - RECENT DEVELOPMENTS THE UK NATIONAL AIDS HEALTH PROMOTION PROGRAMME - RECENT DEVELOPMENTS Kaplan, M. Wellington, & P. S. Bagard, S. Health Education Authority, London.

Objective: To describe recent developments and critically review the evolution of the National AIDS Health Promotion Programme in the UK.

Methods: Since 1984, public education efforts have been monitored through consumer research and other public response indicators.

Results: The 1988-87 mass media campaign created high levels of public awareness. But a survey in November 1987 showed significant levels of public anxiety about AIDS, increasing public complacency and so heterosexually behaviour change. A new 1988 campaign was directed at young people and suggested, for the first time, some heterosexual behaviour shift with claimed reductions in casual sex and increased condom usage. The 1989 campaign is aimed at improving the quality of public knowledge, and creating a continuous presence for AIDS issues in the public mind. The UK Programme has evolved substantially over 1986-89, with content and interpersonal approaches have been designed. Target audience specific activities have been developed addressing, for example, homosexual, ethnic minorities, prisoners, people in the workplace, youth and women. To maximize programme outreach, priority is placed on interagency collaboration across the national/local interfaces. Programme development is a dynamic process responding to changing epidemiology and altering socio-cultural perceptions of HIV/AIDS.

W.E.O.25 EVALUATION OF THE NATIONAL AIDS MULTI-MEDIA PUBLIC INFORMATION CAMPAIGN EVALUATION OF THE NATIONAL AIDS MULTI-MEDIA PUBLIC INFORMATION CAMPAIGN Williams, Kenneth L., Dueser, B.D., and Wurdack, P., Centers for Disease Control, Atlanta, Georgia, U.S.A., ** National Center for Health Statistics, Hyattsville, Maryland, U.S.A., *** Ogilvy & Mather Advertising, Atlanta, Georgia, U.S.A.

Objective: To discuss the impact of the U.S. Government's national AIDS public information campaign to inform and educate the American public about AIDS and HIV infection in terms of knowledge, attitudes and beliefs.

Methods: The vast amount and types of HIV/AIDS activities occurring throughout the U.S. makes assessment of a national information campaign very difficult. Methodologies used to assess the impact (i.e., household level) will be presented.

Results: Evidence from the National Center for Health Statistics' monthly Health Interview Survey (approximately 3000 households per month), number calls to the National AIDS Hotline, distribution of educational materials by the National AIDS Clearinghouses, along with other State data will be described. Time correlation between campaign activities such as airing of Campaign PSA's, mailing of the brochure "Understanding AIDS" to all U.S. households, and telephone calls to the National AIDS Hotline will be explored and their impact on the general public will be discussed. There appears to be a correlation between the campaign activities and public knowledge, attitudes and beliefs regarding AIDS. Further studies are required to assess whether the campaign efforts are directly related to these changes.

Séance thématique Specialty Session

Le SIDA, la société et le comportement AIDS, Society and Behaviour

Services de pastoral Pastoral Care

W.E.O.28 PASTORAL CARE IN AIDS MANAGEMENT
Edgar, Allison; Weiss, M.; Campbell, J.D.; Chawwa, T.
The Salvation Army Chikankata Hospital, Harare, Zimb.

Objective: To describe pastoral care as part of integrated AIDS management in the context of home based care and prevention.

Methods: The management of AIDS at Chikankata Hospital has followed a pattern of home based care with hospital intervention where required. Management is described as an integrated approach to the disciplines of clinical care, education, counselling, administration and pastoral care. Implementation of this concept at Chikankata has been progressed through the formation of a multidisciplinary team. The dynamics of the team are discussed with reference to integrated management and then with specific reference to pastoral care.

Results: Pastoral care is presented as a valid and necessary component of care for patients, families and communities affected by AIDS, particularly in the context of African spiritual tradition. After defining pastoral care, its application is described in terms of patient responses, behaviour change, death, and quality of life.

Conclusion: It is proposed that without provision for pastoral care management is incomplete, and that pastoral care can be appropriately implemented through an integrated, multidisciplinary team approach to care and prevention for patients, families and communities.

W.E.O.27 AN EVANGELICAL DENOMINATION RESPONDS TO AIDS
Finger, Reginald, MD, MPH; Malloy, Michael, AGMA*,
Missouri Health Care Fellowship, Kansas City, Missouri, USA
*Christian Counseling Services, Nashville, Tennessee, USA & Association of
Nazarenes in Social Work, Kansas City, Missouri, USA

Objective: To utilize the material, human, and spiritual resources of a religious denomination to deliver compassionate care to those with HIV infection and their families; to educate pastors and laypersons in the church in order to facilitate a scientifically sound and compassionate response to HIV. **Methods:** The evangelical community has often been perceived as holding a judgmental and unsympathetic attitude toward those with HIV, because of the risk behaviors in which many of them have participated. In July 1988, over one hundred local and national leaders of the Church of the Nazarene met in New York state to explore HIV-related issues and to plan for educational outreach to the denomination and for a coordinated compassionate response. This conference is believed to be the first of its kind for an evangelical denomination. Since the conference, an informal network of leaders has been formed to continue the efforts.

Results: As a result of these efforts, the established urban ministries of the Church of the Nazarene in New York, Washington DC, and San Francisco are more effectively serving people with AIDS. Pastors and laypersons across the church are increasingly willing to minister to MSM in the local churches. **Conclusion:** The evangelical community represents a potentially powerful resource for education and human services. The combination of valid medical and epidemiologic information about HIV with a sound theological basis for relating to those with risk behaviors, results in effective compassion.

W.E.O.28 JEWISH LAW, VALUES AND THE SOCIAL ISSUES ARISING FROM HIV DISEASE
Freedman, Benjamin; McGill University and the
Jewish General Hospital, Montreal, Canada

Jewish law (halakha) and associated literature comprises one of the oldest and most developed systems for the analysis of bioethical issues. The method employed proceeds by means of analogical reasoning from controlled values and ethical schemata. The schemata relevant to HIV include the extent and particulars of the duty to guard against infection as relevant to, e.g., blood and body fluid precautions; the commandment of reaching for/visiting the sick ('shilukh cholim') as related to AIDS care and hospices; social and medical confidentiality; prohibitions on "sleazebagging" ('shlut and lashon hora'); and the adjudication of conflict between a duty to aid those in need and the duty to preserve one's own health. Details of these halakic schemata are applied to current difficult social issues raised by HIV disease areas of interest in their own right, and provide a useful contrasting perspective on values and their prioritization.

W.E.O.29 RELIGIOUS LEADERS IN SÃO PAULO BRAZIL JOIN THE AIDS PREVENTION AND CONTROL,
INDUSTRIAL & FERNANDES M.R.;
Centro de Referência e Treinamento em Aids, São Paulo, Brazil.

Objective: To decrease the global impact of HIV infection in the general population through the religious leaders.

Methods: a. Mobilization b. Sensibilization c. Conscientization d. 20 hours training in human sexuality, clinical, epidemiologic, ethical, legal, psycho-social.

Aspects on Aids:

Evaluation: A questionnaire was applied before and after the training course.

Results: The religious leaders of 14 different religious groups decided:

A. To promote information and prevention on AIDS to their communities.

B. Give spiritual support to HIV patients and families.

C. To open houses to take care of HIV patients.

D. Organization of ecumenic events over 2 months for solidarity and non discrimination.

W.E.O.30 BABA'I CONCEPTS TOWARD AIDS PATIENTS AND SOCIETY
Moses, M.; Mosechi, R.; Mungu, M.; *Musa, L. and
*Mwanga, M.

*Department of Medicine, *Mwanga, M. Hospital, *National Spiritual Assembly of the Baha'is of East and West, University of Kinshasa, Kinshasa, Zaïre

Objective: To describe the Baha'i teachings in relation to the AIDS patient and society.

Methods: The AIDS epidemic has caused worldwide concern from religious and secular organizations. In the absence of a unified stance, we reviewed the Baha'i writings to elucidate the Baha'i recommendations.

Results: The Baha'i Faith is an independent religion which believes in the harmony between science and religion - that these two potent forces must go hand-in-hand for the benefit of mankind. It believes in the fundamental unity and solidarity of the human race. It rejects all forms of prejudice and therefore believes that AIDS victims should receive support and compassion without trace of discrimination. It regards marriage as a "fortress of well-being" and encourages the practice of chastity before marriage and fidelity afterwards as a protection to the individual and the society. It requires total abstinence from habit-forming drugs except for medical purposes prescribed by a physician.

Conclusion: As a strong supporter of human solidarity, the Baha'i Faith rejects all forms of prejudice against AIDS' victims. It offers clear teachings which can serve as a protection to the individual and the society. The practice of these principles has the potential to control this epidemic.

M.E.P.1 A STRUCTURED EDUCATIONAL SUPPORT GROUP FOR HIV INFECTED INDIVIDUALS

Henry L. Yashavaram, Catherine Tendler, Ruth Skipton-Levy, Melanie Steiner, Ann Stuart

Columbia University School of Public Health - Box 1814 Madison Sq. Station, New York, NY 10032, USA

A six session structured group model for HIV seropositive individuals was developed as part of a randomized control study of newly identified HIV seropositive individuals. 95 individuals have participated with an average of 3-4 per group. Most groups have been heterogeneous with regard to risk factors, age and sex. This psychosocial intervention consists of professionally led group education as well as psychological and social components. Educational content includes information about transmission of the virus as it relates to daily living and sexual practices; medical aspects of HIV infection, health promotion, disease prevention strategies are reviewed. Skills in stress reduction and communication are taught. Individuals share feelings, experiences, and coping strategies.

Groups have decreased the social isolation of HIV positive individuals. Many have developed sufficient cohesiveness to continue as peer support groups. Peer groups seek consultation of professional group leaders as new issues emerge such as changing medical information, illness and death of group members.

M.E.P.2 REPORT FROM A PUBLIC HEALTH PSYCHOSOCIAL CLINIC FOR GAY AND BISEXUAL MEN WITH HIV-RELATED PROBLEMS

Zeppeli, Glenn; Westman, Bo**

*Medical Director and **Clinical Psychologist, Department of Landstinget Psykiatri, Wolmar Yngkullagatan 25, 116 50 Stockholm, Sweden.

Objective. Critical discussion of team formation and team function. Discussion of the need for a clinic aimed especially at gay men. Preliminary analysis of the problems presented by the clients. Tentative evaluation of the therapies and services offered.

Methods. Statistical description of the more than 325 clients. Critical essay on the delicacies and vicissitudes in building a team, forming an agreed philosophy on client work and ascertaining efficiency and cohesion.

Results. The clinic has almost equally served both seropositive and seronegative clients. Recurrent themes in both groups alike and centers often on problems around sexuality and low self esteem. The more sensitive a person is about homosexuality the more liable does he seem to be prone to anxiety. Low esteem is a risk factor for developing (alcohol) abuse which in turn increases the tendency towards risk sexual behavior. There seems to be a strong need for addiction recovery facilities directed towards gay men. Community Building is team based at a gay clientele with HIV-related problems means encountering problems on many levels - yet there are strong motives for specialized clinics with this commission. "Key competence" and tolerant compassion required.

M.E.P.3 AIDS-STIGMA AND ANTI-GAY PREJUDICE: PUBLIC REACTIONS TO AIDS-RELATED POLICIES AND TO GAY MEN IN THE U.S.A.

Markus, Gregory M. and **Glum, E.K.**

Creighton University of Washington, St. Paul, MN, U.S.A.

Objectives. To examine the relationship between attitudes held by the U.S. public toward AIDS-related policies and gay men.

Methods. Two samples were used: 1) 153 adults from 5 U.S. cities who completed written questionnaires; and 2) 859 adults from a subsequent national telephone survey. Responses to a battery of AIDS-policy items were factor analyzed, scales were constructed, and regression analyses conducted to determine the best predictors of AIDS-related policy attitudes.

Results. Two factors consistently emerged for AIDS-policy attitudes. Factor #1 items proposed punitive measures to be taken toward persons with AIDS (e.g., quarantine); this factor includes a strong component of blaming people with AIDS for their condition. Factor #2 consisted of items generally endorsed by public health authorities (e.g., education about safer sex). The factors were uncorrelated in the small sample; in the national sample, they were negatively correlated among Whites, but not correlated among Blacks. Attitudes toward gay men were predictive of scores on both factors, with some analysis suggesting that they react a particularly strong influence on attitudes toward punitive policies.

Conclusion. Attitudes toward AIDS-related policies are multidimensional; ambivalence about AIDS may appear in the form of agreement with punitive as well as constructive public health policies. Influencing U.S. public opinion may require concurrent attempts to reduce anti-gay prejudice.

M.E.P.4 COMMUNICATING AIDS INFORMATION TO HISPANICS: THE IMPORTANCE OF LANGUAGE AND MEDIA PREFERENCE

Hu, Dale J.; Keller, R.H.; Fleming, D.M.**

**Johns Hopkins University School of Hygiene and Public Health, Baltimore, Maryland, **Stouffer Medical Center, Woodburn, Oregon, Oregon State Health Dept., Portland, Oregon, U.S.A.

Objective. To design an effective AIDS education program for Hispanics in Oregon based on language (Spanish/English) and media preference as well as to increase information on AIDS knowledge and attitudes for Hispanics, the fastest growing minority group in the U.S.

Methods. The first part of the program began in January of 1988 with a survey study of 218 Hispanics from three clinics in Oregon to examine beliefs about AIDS and to determine the principal sources of information access for this population.

Results. Major findings from the study showed that respondents whose primary language was Spanish tended to have fewer information sources and relied relatively more on broadcast media than printed media. Despite recent statewide AIDS education efforts, almost one-half of Spanish-speaking only respondents denied having received AIDS information before. In addition, almost one-half of the sample did not believe or were unsure whether condoms could prevent the transmission of AIDS. Compared to primarily English speakers, respondents whose primary language was Spanish were more likely to believe that AIDS could be casually transmitted and less likely to believe that condoms could prevent transmission.

Conclusion. Based on the results of this study, a culturally and linguistically appropriate media campaign targeted at Hispanics in Oregon was developed and implemented.

M.E.P.5 A GAY - & PROSTITUTE APPROACH TO MENTAL NURSING

Gillian, James, Royal College of Nursing, 10, Cavendish

Square, London, England.

This paper aims to outline the proactive approach required to meet the educational needs to provide the necessary information to those closely involved in the care and training of people with a Mental Handicap both in the community and in residential settings and for the parents and their children - so developing a positive attitude in relation to the many aspects of education and social change required.

There is already a subculture within this field which has developed many stigmatising effects which delay hamper and hinder progress for and colour attitudes to our fellow citizens and to have any further additional labels which may further handicap their chances of being accepted as a full member of society can only disadvantage them further.

The aim of the Society of Mental Handicap Nursing within the Royal College is to provide a format which will help those reading our booklet to promote a positive attitude to the changing needs of those with a Mental Handicap in any setting.

M.E.P.6 EVALUATION OF AIDS EDUCATION PROGRAMS FOR OFFENDERS

Jan, S. Godes, M. Sall*, W. Thelen*, B. Miller**

**Sherman, J. Craig

*Hennepin County Community Health Department and **Hennepin County Office of Planning & Development, Minneapolis, Minnesota, U.S.A.

Objective. 1) To determine AIDS risk and baseline levels of knowledge, attitudes and behaviors for adult and juvenile offenders. 2) To compare offenders' knowledge, attitudes and behavior outcomes after participation in different methods of AIDS education.

Methods. Random assignment of 204 offenders to 1 of 4 methods of AIDS education: printed material only, video only, video and discussion with a nurse educator (NE), and discussion with NE only. Pre and post-tests (knowledge, attitudes and behaviors) and a risk assessment were administered.

Results. The self-reported behavioral assessment showed the target population to be one with considerable risks. A small, but significant increase in knowledge and attitude mean scores occurred from pre to post-test for 3 methods (t-test, p < .05). No significant differences were found between these 3 interventions (ANOVA). Findings from a 3 month follow-up study of changes in behavior after training will be presented.

Conclusion. Although the baseline levels of knowledge about AIDS were higher than expected, adult and juvenile offenders did benefit from receiving AIDS education while in the Correction system. Shifting to a curriculum that focuses on specific techniques for achieving behavior change may have greater potential for success with this special-needs population.

Le SIDA, la société et le comportement AIDS, Society and Behaviour

M.E.P.7 AN APPLICATION OF SOCIAL MARKETING TO THE DEVELOPMENT OF AIDS EDUCATIONAL MATERIALS.
MARGARET L. BRETHER, GREENWOOD, J.A.; PRINDEBAST, J.T.; MONTVOYA, J.L.
*CENTRE OF ORANGE HARBOR HEALTH AGENCY, GAITHERSBURG, CALIF., U.S.A.
*MONTVOYA, HARBOR, ORANGE, CALIF., U.S.A.

Objective: To develop written materials about AIDS education for persons with limited exposure to formal education and whose primary levels of education are below high school.

Methods: The HEALTH CARE AGENCY FOLLOWED THE PRINCIPLES AND TOOLS OF SOCIAL MARKETING TO DEVELOP A SPANISH LANGUAGE AIDS EDUCATION BOOKLET TARGETED AT THE LATINO MEXICAN/SPANISH SPEAKING POPULATION WITH LITTLE EXPOSURE TO FORMAL EDUCATION. THE FORMAT IS THAT OF A "PITCHBOOK" (SHOW-OPERA COMBO BOOK). THIS FORMAT WAS CHOSEN BECAUSE IT IS CONSISTENT WITH A POPULAR GENRE OF ENTERTAINMENT IN LATIN AMERICA. ALTHOUGH THE MESSAGE WAS DEVELOPED WITH MAXIMUM RELIANCE ON VISUAL CUES AND A MINIMAL RELIANCE ON TEXT, THE WRITING CONTENT IS ESSENTIAL, AND VERY IMPORTANT FOR EDUCATION. THEREFORE, IT WAS DEVELOPED IN A FORM WHICH CAN BE UNDERSTOOD BY INDIVIDUALS WITH NO GREATER EDUCATION LEVELS OF EDUCATION. THE BOOKLET WAS EVALUATED BY FOCUS GROUPS AND A SEPARATE ASSESSMENT OF THE LEVEL OF READING DIFFICULTY WAS CONDUCTED. THE ASSESSMENT OF READING DIFFICULTY WAS FOR DIAGNOSTIC, CAPTIONING AND INSTRUCTIONS.

Results: Focus group results revealed that the booklet has a high degree of comprehension and acceptability in the target population. The dialogue was added to be at the third grade level; the captions at the fourth grade level and the instructions at the sixth grade level.

Conclusions: IT IS SUGGESTED THAT THIS IS A USEFUL METHOD FOR DEVELOPING AIDS EDUCATION MATERIALS THAT ARE APPROPRIATE FOR THE LANGUAGE, EDUCATIONAL, AND CULTURAL CHARACTERISTICS OF PARTICULAR TARGET GROUPS. THE PITCHBOOK IS CURRENTLY BEING USED WITH GREAT SUCCESS IN OUR CLINICS AND AIDS COMMUNITY EDUCATION OUTREACH EFFORTS.

M.E.P.9 AIDS IN THE INNER CITY: A BLACK COMMUNITY ORGANIZATION'S RESPONSE TO THE AIDS EPIDEMIC.
Marilyn-Meléndez, M.D., *University of California, San Francisco and Research on AIDS, Center for AIDS Prevention Studies, University of California, San Francisco, U.S.A.

Objective: To assess the factors which encourage minority community organizations to become involved in AIDS prevention.

Method: A local organization, noted for its involvement in community affairs, including AIDS education and drug abuse services, was asked to participate in the study. The anthropological field methods of participant-observation and in-depth interviewing were used in a study conducted over a period of six months. The researcher worked as a volunteer with the AIDS education unit and developed contacts within the organization and the community.

Findings: The organization's entry into AIDS prevention was aided by three important factors: 1) the organization had a strong central leader who was committed to the community and to AIDS education; 2) the flexible structure of the organization enabled it to respond to problems within the community; and 3) AIDS education could be conducted through existing services provided to drug-using clients.

Conclusions: The initial response to AIDS prevention activities by this organization was facilitated by strong local leadership and concern for community welfare. Secure funding sources were critical in developing building programs. Leadership and funding each effect an organization's response, but may be of critical importance in different times.

M.E.P.11 AIDS EDUCATION IN COMMUNITIES OF COLOR: A PRIVATE-PUBLIC PARTNERSHIP MODEL.
Paula M. Friedman, J. and Bradford, Jr.
*People of Color Against AIDS Network/Sea/King Cty. Hlth Dept., Seattle, WA

Objective: To describe a model for AIDS education in communities of color.

Methods: People of Color Against AIDS Network (POCAN) developed a four level strategy to engage communities of color in AIDS education. Level One is to identify issues in terms that are relevant to, and in the idiom of the community. Level Two is to organize community support from both private and public sectors. Level Three is to mobilize the community to confront AIDS through coalition building. Level Four is to motivate individuals to change behavior via direct education, and advocacy on behalf of these individuals.

Results: The strategy was successfully implemented in communities of color statewide. Issues identification occurred via discussions with community leaders and focus groups. Community support was secured through POCAN's participation in community events, development of culturally specific materials (including a nationally acclaimed comic book for youth of color), and the famous Last Words media campaign, engagement of local and state health departments, and organization of AIDS events including a national conference attended by 350 people. Mobilization of communities was achieved by providing leadership for collaborative education projects taken on by 10 community agencies. Network members are currently being addressed by POCAN and collaborating agencies, who now have credibility in the community.

Conclusion: AIDS communities of color can be achieved by organizing that culminates in the provision of education by indigenous community organizations, with the leadership and oversight of a central agency.

M.E.P.8 USING NATIONAL AND REGIONAL MINORITY ORGANIZATIONS TO PROVIDE CULTURALLY RELEVANT HIV INFORMATION AND EDUCATION IN THE UNITED STATES.
FARANDER, M.; ISHAI, DUNCAN, W.; LANDSAY, B. AND KORNWAG, A.
Centers for Disease Control, Atlanta, Georgia, U.S.A.

Objective: To describe a program for developing and strengthening the participation of national and regional minority organizations in educational efforts to prevent the spread of HIV infection in the U.S. Method: In 1988, the Centers for Disease Control funded 23 national and regional minority organizations to develop culturally relevant information and education projects targeting minorities at risk. Description of programs and preliminary data on their impact and reach, obtained from quarterly reports, will be provided and includes such variables as number of persons reached, changes in knowledge, attitudes and beliefs, and strategies for coordinating activities, coalition building and networking efforts will be discussed.

Results: To date over 900 persons participated in 20 national and local workshops. Preliminary data indicates significant change in knowledge, attitudes and beliefs. Twelve public service announcements using celebrities were developed for TV and theatre audiences. Preliminary figures suggest 87% drop after recall, 78% 3-week recall, and 78% 4-week recall for theatre viewers. Other significant findings and evidence of networking and coalition building among grantees will be presented.

Conclusions: National and regional minority organizations are effective vehicles for providing unique and culturally relevant information and education to minorities in the United States.

M.E.P.10 AIDS EDUCATION PROGRAM FOR NATIVE IMMIGRANTS IN MONTREAL.
Métin, M.; Kervelle, J.; Alchou, A.; Abrevas, M.-J.; Soperol, J.; Bréard, J.; Kervelle, P.; H. H. S. J.
Groupe Natif pour la Prévention du SIDA (GNP-PSA), Montréal, Canada.

As of January 1989, 108 (10%) of the 723 adult cases diagnosed in Québec since 1979 were born in Haiti and 20 of the 30 pediatric AIDS cases in this province were born in Haitian mothers.

Objective: To improve AIDS awareness among the 800 Haitian immigrants in Montreal.

Methods: Because this community was stigmatized in the early years of the AIDS epidemic, our first goal was to mobilize community leaders to support the planning of an AIDS educational program and then to help increase the credibility of the messages. Focus groups were used to formulate french and Creole messages in the fall of 1987. Educational tools included: pamphlets, posters, video, public service announcements in creole radio, TV shows and newsletters. A show response center was also made available.

Results: 4 6 week multi media campaign was organized in the spring of 1988. Four weekly radio shows on AIDS prevention were aired on 2 community radio stations and ads were put in the community newspapers. Educative materials distributed included: 395 pamphlets, 439 buttons, 138 posters (including the GNP-PSA's slogan "Ma Sida, Monnaie au Pain"). Between July and December 1988, 22 (8%) of 269 randomly selected adult Haitians in Montreal reported having participated in an AIDS educational program.

Conclusions: In AIDS education outreach program is now available for a community that until recently was stigmatized. Continued involvement of our community leaders is essential to the success of the program.

M.E.P.12 IMPLEMENTING A CULTURALLY SENSITIVE AIDS PREVENTION PROGRAM FOR HAITIAN IMMIGRANTS IN NEW YORK CITY.
Marilyn Friedman, P. J. Stewart, Y. J. Delcorvis, J.
*AIDS Prevention Center, SUNY-HSC @ Brooklyn, NYC

Objective: To describe the national development of an AIDS Prevention Program for Haitian immigrants in NYC.

Methods: Studies in NYC have shown a high prevalence (64) of HIV infection in recent Haitian immigrants. The Haitian community presents many barriers to AIDS prevention programs including:

1. A history of stigmatization and discrimination.
2. A language impeding the development of printed educational materials;
3. Inadequate access and utilization of medical resources both here and in Haiti;
4. Lack of understanding of concept of prevention of disease;
5. General mistrust of authorities because of both immigration status, and relationships with authority in Haiti.

Results: Components of an effective AIDS Prevention Program should include: 1. HIV counseling and education offered in Creole as a routine part of medical visits when indicated. 2. Active participation by Haitian physicians and community press in educating the population. 3. Unique outreach activities including: videos, skits, and comic books. 4. Public service announcements by TV. 5. Outreach by radio. 6. TV.

Conclusion: In this population the patient's perception of both risk and prevention may be impeded because of multiple barriers. An organized approach must be utilized in order to overcome such problems and increase utilization of appropriate services.

Le SIDA, la société et le comportement AIDS, Society and Behaviour

M.E.P.13 AIDS KNOWLEDGE, LANGUAGE USE AND RESPONSE TO SPANISH AND ENGLISH MEDIA MESSAGES OF LOW-INCOME HISPANIC-AMERICAN WOMEN IN SOUTH TEXAS.

Meiner, Marc; Hodge, C.; Roberts, A.; Bayas, M. University of Texas Health Science Center, San Antonio TX USA

Objective. To determine the educational relationship between AIDS knowledge, language preference and response to AIDS public radio messages for Hispanic women in South Texas.
Methods. We surveyed 212 women in two predominantly Mexican-American housing projects, employing language of preference for each. Scales were constructed to measure Spanish Language Use (SLU), correct/incorrect knowledge of HIV issues (AK/IAK), risks for HIV (R), recent contact with sexual partners sharing HIV information with children (CK), reported messages from radio (RM), and attitudes toward media messages (OFA).
Results. We found positive correlations between SLU and AK- (p<0.001), AKI and CK (p<0.002), and GK and AKI (p<0.001); and a negative correlation between SLU and AKI (p<0.001). In analysis of media, there was no significant association of RM and SLU (p>0.05) or GK. Of note were positive correlations between AKI and OPA (r=-.33, p<0.006) and OPA and SLU (r=-.31, p<0.03).

Conclusion. Spanish language preference in these Hispanic women was associated with less net AIDS knowledge and greater enthusiasm for specific messages on HIV risks, precautions and testing. The data suggest that Spanish language media is effective in outreach to Hispanic women with less AKI.

M.E.P.15 UTILIZING THE MASS MEDIA TO PROVIDE CULTURALLY RELEVANT HIV EDUCATION TO HISPANIC AMERICANS

Zayas, L. J.; Lopez, R. M.; Montelone, L. M. *Centers for Disease Control and Prevention, Division of HIV/AIDS Prevention, Los Angeles, California, U.S.A. **RCET TV/Hispanic Health, Los Angeles, California, U.S.A. ***Sosa and Associates, San Antonio, Texas, U.S.A.

Objective. To present a working model for developing effective, culturally relevant mass media HIV education programs for Hispanics.
Methods. Essential components of the model will be illustrated and its practical application described by tracing the development of three video campaigns (SIDA in AIDS, ALICIA and AMERICA RESPONDE TO AIDS FOR HISPANICS) from initial concept development to production and utilization. Effectiveness of the model was assessed via field tests on stratified samples from the target population, viewer ratings, press coverage, ratings from national experts, number and types of calls to national and local hotlines, and number of requests for the products. A set of principles for developing effective, culturally relevant mass media interventions for minority populations will be provided.
Results. Preliminary analyses of SIDA in AIDS data suggest over 161 increases in volume of calls to the national hotline; press coverage in all major newspapers in the market areas; and overwhelmingly positive ratings from national experts. Viewership ratings were either good or extremely good in 80% of the major markets.
Conclusion. Utilization of this model will increase the effectiveness and reach of mass media efforts targeting Hispanic Americans.

M.E.P.17 THE IMPACT OF MEDIA EVENTS ON PUBLIC INTEREST IN AIDS

Harfield, F. J.; Kay-Kell, L. A.; Wood, Robert* *Seattle-King County Department of Public Health, Seattle WA, U.S.A.

Objective. To assess the impact of major media events on general public concern about AIDS, as to the Seattle-King County, King County, Wash. **Methods.** The Seattle-King County Health Department's AIDS Prevention Project staff an information and referral hotline 50 hours per week. Data are routinely collected on the number of incoming calls, gender of callers and risk level with regard to infection with HIV. We analyzed trends in numbers and types of calls with respect to the following:
Results. Calls to the hotline increased immediately following major media events. In the 3 days following the National Hotline, the number of calls doubled compared with the average number of calls during a comparable time period. We noted increases in requests for antibody testing in low risk sites, and similar peaks after other media events including the release of CDC data on the risk of HIV infection from blood transfusions (May 1987), and national network coverage of the International AIDS Conference, 1987 and 1988. The percentage of calls from females and no risk or low risk individuals also increased following these events.
Conclusion. Major media events have a strong influence on the general public's interest in AIDS, and provide an opportunity for local hotlines to target youth and other vulnerable populations who might not be reached by other campaigns. The Seattle National Hotline was similar to that of a print or electronic media event, indicating a need for further study of the relative effectiveness of a costly, labor intensive education strategy like the National Hotline.

Medias

M.E.P.14 AIDS: THE LANGUAGE, MEDIA, AND PUBLIC RESPONSE

Duffness, Jesse C. Waterloo Regional Health Unit, Kitchener Ontario, Canada.

Objective: To examine the impact of media coverage of AIDS in children papers and magazines, and to ascertain differences in public and media response to AIDS following the Ontario Ministry of Health #7 million dollar "Let's Talk" media education campaign.

Methods: An examination of local print media coverage of AIDS related articles both before and after the Ministry of Health "Let's Talk" campaign. Additional examination of pre-test instruments distributed at AIDS education presentations. A critical examination of the language used by the media in coverage of (a) medical reports, (b) lifestyle articles, and (c) public and private response stories.

Conclusion: The Ministry of Health advertising campaign has had some impact on the general public. However, while many people now believe AIDS cannot be contracted by casual contact, great confusion still exists around transmission and risk categories. Continued education is required, but such education must be targeted at specific audiences if it is to be successful.

M.E.P.16 DEVELOPING A LARGE SCALE AIDS MEDIA CAMPAIGN BY COMBINING PUBLIC AND PRIVATE SECTOR RESOURCES

Nahata, Claudia L.; Fleming, D.; McAllister, R.; Young, O. M. **Oregon Health Division, Portland, Oregon, U.S.A. ***Sosa and Associates, Portland, Oregon, U.S.A.

Objective: To educate the public about AIDS through a statewide media campaign.
Methods: The Oregon Health Division collaborated with two private advertising agencies to produce an AIDS education media campaign. The Division contributed seed money and public health expertise and obtained input and endorsements from political leaders, health care providers, AIDS activists and religious leaders. The private sector donated all creative and production talent and advertising time and space. All material was produced at cost. The campaign's effect was measured by two statewide random digit dialing surveys of 600-800 people each conducted at the beginning and end of the four month campaign.
Results: The campaign was launched in 10/87 by the governor. During the following three months, six T.V. spots were aired 1,532 times; four radio spots were played 3,516 times; 34 newspapers on at least one of six print ads, 120 billboards, 275 bumper and 75 exterior transit ads were placed; and 20,000 bumper stickers and 5,000 copies of 4 posters were distributed. After the campaign, 67% of those polled had seen or heard some of the campaign. Recognition of specific signs or slogans varied between 60% and 87%. People polled after the campaign were more likely to believe that HIV could be transmitted from mother to fetus (78% vs 69%, p<0.01), was likely to believe it safe to have sex with someone who tested negative for AIDS (64% vs 59%, p<0.01) and, among 18-39 year olds, more likely to accept the use of condoms (50% vs 46%, p<0.01). The campaign cost Oregon taxpayers \$70,000. The value of donated private-sector time and services was estimated at one million dollars. Eight national and international awards have been received for the campaign.
Conclusions: Combining public-sector seed money and public health expertise with private-sector talent and resources that are largely dormant is an effective way to mount a large AIDS public information campaign.

M.E.P.18 PERCEIVED RISK OF HIV TRANSMISSION FROM A NONCOUNSELOR RESIDENTIAL POINT WITH AIDS AMONG LAY PEOPLE AND PUBLIC HEALTH SPECIALISTS

Gen Chi, Dept. Biostatistics, Human Med., Nanyang University School of Medicine, Tokyo, Japan.

Objective. To see 1) the magnitude of HIV transmission risk perceived by lay people and public health professionals immediately after mass media exposure that a man with AIDS had contacts with 150 prostitutes and homosexual males prior to the development of the disease and 2) attitude toward preventive policies with alternative measures of varying degrees in comparison with the size of perceived risk.

Methods. Study 1: Questionnaire study was conducted within a week after the news was released on 893 lay people (students, office workers) and 38 public health specialists. Study 2: Questionnaire study on 570 university students regarding the above described risk estimation juxtaposed with their attitudes toward preventive programs.

Results. Study 1: Number of transmission perceived by the lay people was much smaller than that by the specialists (range, 100-893 vs. 0-3).

Study 2: No attitudinal differences between the group with higher estimation and the one with lower estimation.
Conclusion: Lay people tend to overestimate the risk of HIV transmission and may be more vulnerable to the influence of mass media. Bicultural educational messages may be associated with fear and anxiety but not with the presumed magnitude of transmission risk per se.

Le SIDA, la société et le comportement AIDS, Society and Behaviour

M.E.P.25

THE METRO TORONTO AIDS EDUCATION PROGRAM: A MODEL FOR LOW-RESOURTE MEDICAL TRAINING
PAWLIK, Diana, Dreyer, M., Varley, V., and Siskind S.
 *Municipality of Metropolitan Toronto, Toronto, Ontario, Canada.
OBJECTIVE: 1. To provide all Metro employees with the knowledge and skills necessary to prevent transmission of AIDS to abide by Metro AIDS Policy, Human Rights, Health and other legislation; to practice Universal Precautions for infection control; to cope with the psychological, social, and ethical issues raised by AIDS and similar disorders. 2. To provide all persons serviced by Metro with the knowledge and skills listed above and to ensure a consistently high level of service to Metro residents regardless of their status with respect to the AIDS virus.
Methods: The program has a low budget with minimal staff and resources but Metro has more than 12,000 regular employees alone (including health-care, maintenance, land-fill, and sewage treatment workers), many with low English skills and/or non-English language. Because information alone is not enough to bring about behaviour change, the program uses a small-group (5 or less), interactive lecture/workshop (2-3 hours) depending on need or audience approach. Although it may sound costly, this approach ensures high cost-effectiveness by allowing trainees to break through what is often the reality of AIDS in their own lives, and to discuss concerns. It also allows demonstration of control techniques, discussion of ethical issues specific to each workplace and to each individual, and ensures that each trainee has met a person who they can contact with future questions in a confidential manner.
Results and Conclusions: Program is cost-effective in that many people in very different occupations and with very different language levels can be trained so that both knowledge and behaviour change occurs.

M.E.P.26

EFFECTING BEHAVIOR CHANGE THROUGH POLICY AND TRAINING
Gerberding, Julie Louise, M.D., San Francisco General Hospital, San Francisco, California, U.S.A.
Objective: To assess a hospital's interdepartmental approach to the implementation of Universal Blood and Body Substance Precautions effected staff behavior change.
Methods:
 - Sessions most commonly asked during initial training sessions indicated areas of greatest concern
 - Infection Control Committee observations through hospital rounds and problem-solving consultations
 - Major problem areas identified are then targeted as "the Question of the Week" in week-long multi-educational campaigns for staff
 - Knowledge is measured through pre/post tests in the second training program
Results:
 - Ascertain whether supplies and equipment are available
 - American feedback passed to affected department
 - Ascertain cost increases or decreases due to implementation
 - Knowledge gain from the training will be demonstrated in employee practice
Conclusions:
 - Universal Blood and Body Substance Training transcends the formal program and becomes an on-going, on-site process which is evaluated by changes in staff performance

M.E.P.27

AN EMPLOYER-BASED APPROACH TO AIDS PREVENTION, EDUCATION AND MANAGEMENT
Edwards, William L., Vance, R.D., Sofian, S.L., Anderson, E.S., Washington (State) Employees AIDS Prevention Alliance, Seattle, WA, U.S.A.

Many employers lack comprehensive, current and reliable AIDS-related information to use in the workplace. AIDS prevention and education for the general public is the focus of the most recent by the (Washington) State Governor's Task Force on AIDS. The Seattle-based Washington Employees AIDS Prevention Alliance (WEAPA) is a participatory, private sector response to the need for AIDS/HIV infection preventive education and AIDS-related information in the work environment.

WEAPA has two main goals: 1) the promotion of AIDS/HIV infection preventive education at the workplace, and 2) the provision of AIDS/HIV infection management tools to employers. WEAPA provides educational materials, presentations in AIDS prevention, and technical assistance on legal, benefits, cost, and communication issues related to AIDS. WEAPA is co-sponsored by private and public sector organizations. Participation in WEAPA is through membership (annual fee based on work force size) and includes all employees. After one year of operation, WEAPA has 154 employer members, representing an almost equal cross-section of large (500+ employees), medium (100-500 employees) and small (50 employees) employers. WEAPA's first annual conference, an introduction to AIDS/HIV infection prevention and management for employers, was attended by all members. 31% of the members received technical assistance in developing human resources policy and procedures, managing insurance and benefits programs, and keeping current on legal issues related to AIDS. 30% (60) of members report having employees who self-identify as having AIDS or being HIV positive. WEAPA is an innovative private sector prevention and education model applicable for any metropolitan/occupational area. WEAPA has begun to work with other committees interested in workable AIDS education.

M.E.P.28

AN AIDS EDUCATION INTERVENTION IN A MULTIRACIAL HOTEL
INDOYTH
Chidambaram, Srinivas; Sanyasree, M.; Sher, R.; Metz, J.; AIDS Training and Information Centre, South African Institute for Medical Research, Johannesburg, South Africa.

OBJECTIVE: To formulate, implement and evaluate an AIDS education intervention in a multiracial hotel industry.
METHOD: A three-phase intervention was adopted to create an awareness of AIDS amongst all hotel employees. Firstly, executive management attended an AIDS seminar. Secondly, a multidisciplinary team of professionals visited the different hotel regions to address senior, middle and supervisory management about AIDS, and to plan for preventive education. In the final stage, 30 hotel employees were selected on specific criteria for training. Of these, 20 were black, 10 white, with an even ratio of male to female. Two successive groups of 15 people participated in a five-day training course. The objective of the course was to certify them as AIDS educators so that they could disseminate information to all hotel employees. A follow up to monitor progress is carried out at monthly intervals.
RESULTS: In a period of four months 3317 (138) out of a staff complement of 10319 were informed about AIDS. Surveys and questionnaires reflect increased AIDS knowledge and awareness. Additional research is necessary to evaluate attitude and behaviour change.
CONCLUSION: The success of the intervention to-date results from a cadre of educators who can provide continued in-house information, and also from management commitment to promoting AIDS awareness to all hotel employees eg. common vending machines were installed in all hotels.

M.E.P.29

RESPONDING TO AIDS: TEN PRINCIPLES FOR THE WORKPLACE
LEVIN
Chernin, Catherine, Center for AIDS and Human Resources, New York, NY, USA

In response to current employers and employees about associated policies and programs concerning AIDS, the Centers for AIDS on New York City and Human Resources have developed ten principles to guide business, unions, and other organizations. These principles are:

1. People with AIDS or HIV (Human Immunodeficiency Virus) infection are entitled to the same rights and opportunities as people with any other chronic illness. 2. Employment policies must be nondiscriminatory, comply with federal, state, and local laws and regulations. 3. Employees' policies should be based on the scientific and sociological evidence that people with AIDS or HIV infection do not pose a risk of transmission of the virus to coworkers through ordinary workplace contact. 4. The higher levels of management and unions leadership should unequivocally endorse nondiscriminatory employment policies and educational programs about AIDS. 5. Employers and unions should communicate their support of these policies to workers in a simple, clear, and understandable way. 6. Employers should provide employees with sensitive, accurate, and up-to-date education about risk reduction in their personal lives. 7. Employers have a duty to protect the confidentiality of employees' medical information and to prevent work-related rejection by coworkers of an employee with AIDS or HIV infection, employees and unions should undertake education for all employees about AIDS or HIV infection, employees and unions should ensure that HIV screening is voluntary as part of general pre-employment or workplace physical examinations. 10. In those situations where there is a potential risk of exposure to HIV for employees, in health care, when workers may be exposed to blood or blood products, employers should take specific, clear, and understandable steps to provide the necessary equipment, to reinforce appropriate infection control practices and ensure that they are implemented.

As of February 1, 1988, over 300 companies and non-profit organizations in the United States have publicly endorsed these principles. They serve as a model for other groups concerned with these issues.

M.E.P.30

Workplace AIDS Education: An Evaluation of CDC Employees
Shorrock, Egan, S. Klaid, D. Brownell, D. Schell
Centers for Disease Control (CDC), Atlanta, Georgia, USA

Objectives: To examine the impact of an educational intervention on employees' AIDS knowledge, attitudes, beliefs, risk perceptions, HIV test-seeking and level of comfort working with a person with AIDS or HIV.
Methods: A questionnaire designed to assess these factors was self-administered in a pre-post test design by 583 (93%) of the employees attending a one-hour AIDS education session.
Results: Survey respondents were generally white (81%), married (64.8%), female (60.3%), and college educated (70.2%). Mean age was 41.0 years. Overall, participants' awareness and attitudes about AIDS improved significantly ($p < .01$, $p < .001$). However, many participants reported only modest comfort in working with someone infected with HIV (70%). Accurate AIDS knowledge was modestly predictive of how comfortable people would feel working with someone who is infected. Most of the participants who had already been tested (25.2%), had been tested at blood banks. Although CTIs had not been used in the past, CTIs were reported as a major potential site to visit for testing. Additionally, people remain confused about the safety of the nation's blood supply (40% were incorrect) and what the HIV antibody test shows (50% were incorrect). Respondents rated themselves at low risk (50.4%). Nevertheless, over one-third were single adults and 11 felt that they were at risk or were unsure of their risk.
Conclusions: Continued AIDS education targeting these issues and intensive evaluations of such workplace programs are warranted.

M.E.P.31 EDUCATIONAL STRATEGY ON AIDS AT WORKPLACES.
Graciele L. Fernandes, R.T., Abbud, J. R., Adão, V. M., Kakinara, R.
Centro de Referência e Treinamento-Aids, São Paulo, Brasil

Objective: The State of São Paulo, Brazil, is the most industrialized region in South America with approximately 100,000 big companies, and because so many people can be reached at the workplace, one of the primary targets for Aids Education considered by the Department of Education and Training from the Secretary of Health was the workplace.

Methods: Once a month we realized a training course with 20 hours for human resources and health care providers from big companies with the following classes: Epidemiology, Clinical, ethical, legal social and educational aspects on Aids. Evaluation of the training is done with pre and post-test with basic questions due to HIV patient in the workplace.

Results: 408 human resources and health care workers were trained from 149 big companies. 70% of them developed massive campaigns and helped with their own material other smaller companies.

Conclusion: The response of the training course was considered very effective decreasing discrimination and misunderstanding.

M.E.P.33 RESULTS ON THE EFFECTIVENESS OF AN AIDS IN THE WORKPLACE EDUCATION PILOT PROGRAM
Blake, S., Maljer, D., Georgia, A., and Makinson, E.
**American Red Cross, Washington, D.C., U.S.A.

Objective: To assess the short-term impact of an AIDS curriculum in the workplace, and to explore factors associated with knowledge, attitude, and behavior change.

Methods: Pre-post survey results from 1131 employees in six companies were analyzed using paired t-test comparisons and McNemar test statistics to determine the significance of change. Kruskal-Wallis and Chi-square test statistics were used to assess the relationship between change and participant or employer demographic characteristics.

Results: Statistically significant changes ($p < .01$) in knowledge of the mode of transmission, risk perceptions, workplace attitudes toward PWA, spousal and risk reduction behavioral intentions were found. Participant gains following participation were greatest for persons who were less knowledgeable, less confident, less tolerant of PWA, and less likely to engage in prosocial behavior, to communicate about AIDS, or to have done anything previously to reduce their risk for exposure ($p < .05$). Statistically few individual or corporate predictors of change were observed.

Conclusion: Short-term effects of an AIDS education program in the workplace can be demonstrated, particularly for those individuals at greatest need of basic information. Future research and curriculum needs are discussed.

M.E.P.35 MULTI-AGENCY SUPPORT GROUP FOR TRANSFUSION RELATED HIV INFECTION
Stuart, A., Steilen, M. A. and Campbell, S.**
*Columbia University, New York, NY. **Memorial Sloan Kettering Cancer Ctr., New York, NY

Objective: To decrease the isolation of the recipients from their families, to educate patients and their families about HIV infection and to provide a safe environment in which the patients and their families can express their feelings.

Methods: Group was composed of recipients and any of their family members that could/should attend. The contact was for 4 consecutive weekly evening sessions which lasted 90 minutes. Content included fear of infection, anger, frustration, issues of loss of control, shame and grief. Education was very important in this population as they were psychologically sophisticated and grew up in an era in which exposure to infection could result in death.

Results: Group provided a safe environment in which members (age range: 26-75) could share their feelings. These feelings had been denied at home, resulting in family disequilibrium. An ongoing support network was begun.

Conclusion: Important strides were made within this group to restore the homeostasis of the family units. This group model could help others who, because of their beliefs about infections, reinforced by society's fears, are not getting adequate support or medical care.

M.E.P.32 RULES FOR APPROPRIATE CARE AFTER ACCIDENTAL SKIN LESIONS WITH RISK OF EXPOSURE FOR BLOOD BORN INFECTION
Kashraba, Lara, M.D., TSMAN, M.D., Greitt, Tronca, R.N.T.
Department of Epidemiology, National Bacteriological Laboratory, Stockholm, Sweden

Accidental skin lesions in staff handling possibly HIV-infected material often provoke strong feelings of anxiety for an infection. Thus, there is a need for firm rules how to act in order to prevent overreacting and to ensure adequate measures, after several incidents we have formed rules how to advise people in different positions. These rules are divided into four parts each applicable to persons in different roles, summarized as follows:

1. On the spot any blood should be washed away and if bleeding occurs one should try to squeeze out the blood. The exposed person should be brought to the occupational health service together with full details on the suspected nature of the accident.
2. The local safety delegate has to help the person in question to make a report of the accident.
3. The local foreman has to ensure that the exposed person is adequately treated, gets good support, and is taken to the health service, that a complete report is duly written, and that the exposed person's family gets support and advice.
4. If the health service considered must elucidate the circumstances, take all indicated tests, give prophylactic medication, and organize proper follow-up.

Family Family

M.E.P.34 FAMILY THROUGH APPROACH NEW HIV INFECTED CHILDREN
Reisman, Anita and Robinson, A.
Albert Einstein College of Medicine, Bronx, N.Y., U.S.A.

Objective: The index patient with HIV infection identifies a whole family at risk when the mother is infected, possibly the father and at times one or more siblings. The exposure of chronic illnesses paralleled by the acquisition of multiple lesions places a heavy emotional burden on AIDS families. Prior to their HIV infection, these families possess a formidable challenge by the mere fact of their poverty, stigma, rejection, unresolved grief, and poor quality of life.

Method: Clinical observations from case analyses and therapeutic intervention with 45 families at our institution revealed the following: 1) Issues and fears experienced by young adults having their children; 2) Isolation and separation from family members and friends causing the deterioration of couple and family relationships; 3) Full spectrum of emotional illnesses due to loss of loved ones and fear of infecting others; pervasive anxiety related to future prognosis in young adults; 4) Issues related to lack of financial support, sexual involvement, medical outcomes.

Result: Identifying as many family members and friends as possible and eliciting their expert opinion as effective support network, better quality skills and more functional family intervention team. Treating cases outside the family context is ineffective and often detrimental.

Conclusion: In order to dislodge family chaos, sustain family equilibrium, improve compliance and provide families with renewed energy and quality of life, timely and targeted family interventions are crucial to the comprehensive management of HIV infected families.

M.E.P.36 BISEXUAL MEN AND THEIR PARTNER WORKSHOP SESSION
Palmer, William, Research Officer
Gay and Married Men's Association, Melbourne, Victoria, Australia.

Objective: This workshop is designed to explore the issues related to bisexual behaviours in men which may subsequently lead to H.I.V. transmission within the general community. To discuss the research data on which the rationale of the cases is based.

Methods: By examining case histories, to identify a range of sexual and emotional behaviour patterns which may, for a variety of reasons result in H.I.V. infection of men in a primary heterosexual relationship. Such factors as non-cognitive homosexual behaviour, denial of risk behaviour, adolescent type sexual behaviour patterns and unrepresented homosexual experiences will be considered. Emotional barriers to behaviour change and methods to overcome these barriers will be discussed. Factors which risk force positive changes will be presented with the background research information on which they are based.

Results: It is expected that an evolution of emotions and attitudes within the workshop framework will lead to a better understanding of the dilemma routinely faced by men with a bisexual orientation.

Conclusion: By promoting a better understanding of the issues involved in dealing with bisexual behaviour and orientation it is possible to provide more appropriate specialised services to this group of men. The end results at a community level is the protection of the men themselves, their female sexual partners and the children conceived.

Le SIDA, la société et le comportement AIDS, Society and Behaviour

M.E.P.37 AIDS AND HEMOPHILIA: A COORDINATED EDUCATION, SUPPORT AND PERSONAL CARE PROGRAM. PRELIMINARY REPORT FROM A TWO-YEAR PILOT PROJECT

McDonald, John B., Dawick, Sherry*
*University of Calgary, Calgary, Alberta, Canada. **AIDS Calgary, Calgary, Alberta, Canada.

Objective: To describe results of a two-year, Health and Welfare, Canada funded pilot project in education, support and personal care for persons and families having or at-risk for HIV and AIDS in the Southern Alberta Hemophilia Program.

Methods: The project purpose was to strengthen the education, support and personal care network for people with hemophilia and their families in Southern Alberta. This purpose was addressed through four objectives: (1) an education, support and personal care network, (2) cooperation with Regional Hemophilia Society of the Commonwealth Hemophilia Clinic in establishing resource and information services, (3) scheduling regular updates on specific topic meetings conferences, social and information sessions, (4) conducting hospital staff and public education sessions, and (5) providing limited financial assistance in urgent need areas.

Results: In all five program areas, initial information has been established, support and financial assistance provided. A visible strengthening of the hemophilia community resulted, as well as a regular mechanism for education, support and networking occurred.

Conclusion: Evaluation indicates program with modifications is viable and important. First year provincial funding granted for program continuance.

M.E.P.38 THE HIV-INDANGEROSED/INFECTED CHILD IN THE FOSTER-FAMILY

Schwarz, Gabriele; Hense, A.
Arbeitskreis zur Förderung von Pflegekindern e.V., Berlin, Federal Republic of Germany.

Beside medical specifics of HIV-infection with children as there are - problems in diagnosis of HIV-infection, - course of disease, - mortality rate, - infection of mother in case of pre-/perinatal endangered/infected children, there are also a large number of exceptional psychological and judicial problems.

Psychological aspects of HIV-infection with children resulting for example from: - HIV-infection of members of the family, - preliminary uncertainty about HIV-status of the child, - death of the mother, - sickness of the mother, resulting in temporary or permanent living of the child outside of his home, - change in the person who is in charge of the child, - difficulties between own- and foster-family, - problems with social neighbourhood, - problems with institutions.

Judicial aspects to be considered are: Liability of the foster-family, - law regarding electronic data processing figures, - HIV-testing of applicants for foster and adoption of the child, duty of revelation for example, when the child is attending the kindergarten. The poster shows the subjects concerned as well as their combined effects on each another.

M.E.P.39 WHO SPEAKS FOR THE ABANDONED CHILD BORN WITH HIV? A FOSTER PARENT AND ADOPTIVE PARENT RESPONSE.

Chambers, Sandra A.; McCrellin, Barbara*
*Childlink, Inc., Alhambra, Georgia, USA. **Starcross, Amnopolis, Calif., USA.

Objective: To provide for and address the needs of homeless children born with HIV. From the perspective of the child.

Methods: Childlink and Starcross Community are actively involved in the placement and protection of HIV children. Our position is that each child should have maximum human continuity. We have adopted or are in the process of adopting 7 homeless children with HIV. We offer nationwide support and educational services for prospective foster and adoptive parents. The health and dignity of these children are the primary focus in all our lobbying and advocacy efforts.

Results: By cooperating with existing religious outreach programs as well as governmental and social service agencies foster and adoptive parents have been recruited. Foster care homes have been purchased with private monies and parents provided with the appropriate support to care for infants and children born with HIV. These agencies and parents support spiritually, emotionally and usually the day-to-day stable home environment so desperately needed by these children.

Conclusion: Children with HIV should be mainstreamed and given the opportunity for early bonding with an individual or family. Our responsibility as caring human beings is to do everything possible to give these children the opportunity to equip themselves with the mental and emotional resources to fight off this disease. Personal involvement with our adoptive and foster children are proving the validity of this approach.

M.E.P.40 AIDS ORPHANS IN NEW YORK CITY: PROTECTED MEMBERS AND POLICY DRIVES

Shoond, Chris; Weiss and Aida Steiner, 750 Mac Don. St., NY 10025 USA.

Objective: In the focus on AIDS and prevention, it has been widely overlooked that HIV positive women may not only be HIV-infected (HIV+) but also HIV-infected (HIV-) and may all HIV-infected will be orphaned at a mother's death. Realization of orphaned as expected in NYC are projected and implications for social policy and prevention discussed.

Methods: Assessment was made of the relative numbers of HIV- and HIV+ children under age 18 residing with HIV+ mothers in 3 NYC boroughs with high levels of women's infection:

Neighborhood	% Total HIV-Children HIV-Orphaned	% HIV-Orphaned	% HIV-Orphaned
Manhattan	30	5	7.5%
NY Div-Infected	56	7	12%
Brooklyn	46	25	31%

Results: Mothers infected in drug abuse had more HIV+ children than those infected conventionally but, on average, there were 2 HIV- children per mother in both groups. The NYC Dept. of Health estimates there are between 25,000 and 50,000 total infected women in the city, with large numbers approaching illness. Reducing the women's infection by HIV to allow for older women unlikely to have dependent children, if even HIV of the remaining women develop AIDS, it is estimated they will leave behind between 25,777 and 72,000 living, orphaned children, given an average of two HIV- children per woman.

Discussion: While these results are necessarily based on estimates, they have important implications: 1.) In New York and many US, institutions, efforts to directly contact women about prevention are focused on women in general care. However, with many women clearly having had their children by the time they become infected, such an preventive effort, including partner notification, must be focused on women who are already mothers. 2.) National policy and attention to care for orphans is unique in nations with high levels of female infection. AIDS-infected women simply will not have the resources to care for orphans by themselves.

M.E.P.41 EXPERIENCE QUÉBÉCOISE D'INTERVENTION AUPRES DE FAMILLES A L'ÉCHÉANCE D'HOSPITALISATION DE LEUR PROCHE HOMOSEXUEL ATTEINT DE SIDA

Berthelot, Pierre; Poirier, G.**
**CENTRE DE SERVICES SOCIAUX DE Québec, Services sociaux hospitaliers, Équipe de prévention et de soins Québec, Québec, Canada. ** Centre de services sociaux de Québec, Services sociaux hospitaliers, Hôtel-Dieu de Québec, Québec, Québec, Canada.

Objectif: Présentation d'une expérience québécoise d'intervention auprès de FAMILLES à l'occasion de l'hospitalisation de leur proche homosexuel atteint de SIDA.

Methods: Présentation:

- Su processus d'intervention: utiliser la crise vécue au moment de l'hospitalisation comme moment stratégique d'intervention auprès de la famille; accompagner et normaliser le vécu des membres impliqués de la famille; précéder le non-dit pour rendre explicite l'indicible, pour le normaliser et pour supporter la famille.
- des difficultés rencontrées: entre autres: craintes par la famille du jugement de l'intervenant; difficulté de communication de la famille avec les personnes atteintes; peur du secret.
- les questions qui se posent: le deuil pour la famille et chacun de ses membres? l'utilité de l'accompagnement à cette étape...

M.E.P.42 PROVIDING COMPREHENSIVE SERVICES FOR DEVELOPMENTALLY DISABLED CHILDREN WITH AIDS AND ISSUES

Authors: Phyllis Sumner & Anthony Trunfo
THE CHILDREN'S CENTER - 394 East 53rd Street, Brooklyn, New York 11203, U.S.A.

The Herbert O. Birch Services, with IPE Office of Mental Retardation and Developmental Disabilities and the Children's Hospital Medical Center in Brooklyn, New York operates the first community residence providing comprehensive residential, educational, rehabilitative and medical services for ten developmentally disabled "border babies" with AIDS, aged birth to six years.

One out of six babies in NYC are born with the virus. On any day, there are 20-30 border babies left abandoned in City Hospitals.

Over 93% of children with AIDS show measurable HIV-related System dysfunction such as: impaired motor skills, severe language disorders, significant cognitive deficits and loss of acquired developmental milestones. A variety of residential alternatives and specialized diagnostic and therapeutic interventions must be established to address the special needs of infected children. These services are offered: 1) community residence and respite care, 2) special education day care, 3) daily medical surveillance, 4) foster care placement offering case management, training and supervision of families.

The following significant issues will be discussed: foster care vs. congregate care for children with AIDS, aged birth to six years. (Do you have more than 2 people, or, good care vs. bad care whether congregate or foster?) discrimination toward children with AIDS, their caretakers (what should staff do when they are refused entry into a local apartment with the child(ren)? Helping staff cope with the inevitable loss of children with whom they have established loving ties.

M.E.P.43

ACCESSING, READING AND RESEARCHING HARMED HOMOSEXUAL AND BISEXUAL MEN
Phyllis Williams, Research Officer
Gay and Lesbian News Association, Melbourne, Victoria, Australia

Objective: To establish a model method to contact, educate and research harmed homosexual and bisexual men in the field.

Method: Contact was established, and where possible maintained, using a telephone counselling service in combination with an established peer support group. A wide range of additional services were incorporated into this structure to provide suitable medical and legal assistance as well as additional counselling services to the group. Research information was recorded for all participants in a separate format.

Results: Over one thousand calls have been processed - date and a nature of these calls have been followed up in case studies. A wide range of sexual and social behaviour patterns have been noted and an assessment of safe sex knowledge levels has been noted and an assessment of safe sex knowledge levels seen within this group. Knowledge levels for safe sex and general information on AIDS were significantly lower levels than those generally found within the gay community. Data on factors which influence behaviour modification for this group of men are collected. Factors which contribute towards safe sex behaviour for this group of men were also noted.

Conclusion: Harmed homosexual and bisexual men are difficult to access in the general community, as a result little is known about their sexual and social behaviour patterns. This method of accessing and maintaining contact has been successful. Research results obtained indicate the need for a comprehensive campaign aimed toward educating this particular target group and their female partners.

M.E.P.45

DES PROFESSIONNELLES DE LA SANTÉ ET LA CRÉATION D'UN GROUPE D'INFORMATION À QUÉBEC: l'initiation préalable de la complémentarité des ressources.

LAURENCE CHÉLIEU, agente de recherche, Département de Santé Communautaire de l'Hôpital Ste-Justine, Ville de Québec, Québec.

DAVIDE BÉGIN, président du conseil d'administration de MIESS-Québec.
OBJECTIF: Présenter un modèle de collaboration entre des bénévoles et des professionnels de la santé dans la création d'un mouvement d'information et d'éducation dans la lutte contre le SIDA à Québec (MIESS-Québec).

MÉTHODE: Présentation du processus d'implantation, de définition et d'ajustement des méthodes et des actions qui en découlent. Quelques données sur les résultats d'application après 2 ans de fonctionnement seront également présentées et discutées.

RÉSULTATS: En juin 1986, agreement, dans des rencontres se déroulant dans un contexte d'urgence pour échanger sur les problèmes vécus par les personnes atteintes de la maladie et les difficultés rencontrées par les professionnels de la santé, par exemple, pour avoir accès à certaines cliniques particulièrement touchées. Après quelques rencontres, le comité consistait de la nécessité de former un groupe d'éducation bénévoles. Les objectifs visent l'information, l'éducation à la prévention et le support aux personnes atteintes du SIDA.

CONCLUSION: La collaboration entre bénévoles et professionnels de la santé est possible, ainsi qu'essentielle à MIESS-Québec en fait. La détermination tient en insistant sur la spécificité des rôles de chacun.

M.E.P.47

**THE ESTABLISHMENT AND ADMINISTRATION OF
CASEY HOUSE HOSPICE, TORONTO**

HILMAN MATHEN, Executive Director, Casey House Hospice, Canada.

DOROTHY LEY, Board Member, Casey House Hospice.

Objective: To describe the process of the establishment of Casey House Hospice, and the administrative challenge of AIDS hospice management in the health service environment of Ontario, and the political environment surrounding AIDS, and the psychosocial issues of AIDS.

Method: Oral presentation with slides and overheads.

Results: Overview of success and challenge of a free-standing AIDS hospice.

Conclusion: The need for standards and funding mechanisms to allow the model of the free-standing hospice system, within the context of the Canadian health care system.

M.E.P.44

THE GENESIS AND RAPID DEVELOPMENT OF THE AIDS ACTIVIST MOVEMENT

The Dwight Foundation, New York, U.S.A.

Objective: To describe the rise of AIDS activism, including civil disobedience and direct confrontation as a response to the perceived indifference on the part of medical and government officials resulting in a lagged response to the pandemic.

Methods: The presentation will use video clips, still photos and excerpts from the popular press to trace the history of the AIDS activist movement from its inception in the fall-winter of 1984-87 through June 4, 1989.

Results: The confluence of 3 separate currents: the visual arts community of artists and graphic designers, e.g. the Silence = Death Project; advocates of civil disobedience and direct confrontation, e.g. the Lavender Hill Mob; and documentary and educators, e.g. the Testing the Limits Collective, resulted in the founding of ACT UP (the AIDS Coalition to Unleash Power) and similar organizations. These groups not only produce highly successful demonstrations and confrontations but museum exhibits, speakers bureaus, community outreach, and participation at conferences and conventions at which the medical, economic, or sociological aspects of the AIDS pandemic are discussed.

Conclusion: A new medical/social phenomenon has arisen. An afflicted community refusing to accept a passive role in its treatment is challenging medical and governmental authority to demand an equal voice in deciding its fate.

M.E.P.46

A COMPARATIVE STUDY OF LOCAL AIDS PROGRAMS IN THE UNITED KINGDOM

Fve, M^o, Eugénie Nubani^o Baskley, G^o, Cunningham, M^o

^oHealth Education Authority, London; ^oRoyal College of General Practitioners, London; ^oFaculty of Community Medicine, London; ^oTHE KINGDOM

Objective: To critically appraise the diversity of responses made by locally based AIDS programs to supplement the National UK AIDS Prevention Programme.

Methods: Nine areas (urban/rural, high/low HIV prevalence) were selected. In workshop discussions, guidelines were developed for the construction of case studies and their critical analysis.

Results: Nine case studies illustrating good practice and diverse responses were analysed with respect to, various dimensions including:

- organisational arrangements for local AIDS programmes;
- local and specific preventive initiatives (eg. needle exchange schemes for drug users);
- models of care in the community (eg. multi-disciplinary specialist teams);
- training and education (eg. school programmes).

Conclusion: In tackling similar issues, local initiatives have used varied, but successful approaches, dependent on prevailing socio-political contexts and opportunities. In many instances, AIDS initiatives have provided the opportunity to tackle other health concerns. Re-examination of the study's findings is aimed at influencing the development of good AIDS related practices nationwide in the UK.

M.E.P.48

HOMELESSNESS AND AIDS

Blakeney, Barbara, Mahan, Joan
Long Island Shelter, Boston, Massachusetts, U.S.A.

Objective: To identify and present in an educational format, the dual issues of AIDS and homelessness from the perspectives of the Homeless individual with the diagnosis of HIV infection and the clinicians involved in providing care.

Method: A video, produced by the Nurse's clinic at Long Island Shelter. This video focuses specifically on the special problems associated with being homeless and having HIV infection.

Results: At the present time the majority of homeless people with HIV infection at the shelter share the primary risk factor of intravenous drug abuse. Many of these individuals have been homeless prior to their diagnosis. The video explores the experiences, feelings and responses of four homeless men in various stages of their illness, as well as a series of short discussions from the clinicians involved in their care. Approx length is 30 minutes.

M.E.P.49 COMMUNITY COALITION BUILDING AS A MEANS OF IMPROVING SERVICE SYSTEMS FOR PEOPLE WITH HIV INFECTION
Hurtwitz, C., Matheny S., McKeown M., Health Resources and Services Administration, Division of HIV/AIDS, Department of Health and Human Services, Rockville, Maryland, U.S.A.

Objective: AIDS Service Demonstration Projects have been funded to demonstrate the impact of a collaborative coalition of service organizations, coordinated through a case management system, on the continuum of care, comprehensiveness of services, and cost.

Method: To demonstrate that community coalitions can improve patient care and the utilization of unnecessary redundancy of service organizations for PWAs, 21 high AIDS prevalence communities received funds to establish and maintain such coalitions. The cities were selected on the basis of the demographics of the epidemic, the political context and organization of their health care delivery system, and the ability to receive funding. After nearly 2 years in operation, data and experience are available on the relative degree of success of these coalition building efforts.

Results: Factors contributing to the success of coalition efforts include: organizational location of health care and drug abuse services, cohesiveness of groups targeted for services, definition of the historical patterns of health care, cohesiveness of the community, the need for funding resources outside the local community, and the organization formed to receive funding.

Conclusion: While community coalitions can have a positive impact on the quality and cost of services, and innovative strategies can be replicated in other areas, an effective health care delivery system must be tailored to the unique characteristics of a community to insure optimal success.

Services sociaux

Social Services

M.E.P.51 AN ASSESSMENT OF THE PSYCHOSOCIAL NEEDS OF THE HIV ANTIBODY POSITIVE POPULATION USING THE NORTHERN HEALTH AND SOCIAL SERVICE NETWORK.

Chick, Elizabeth, Hodgson, V., Grayson, N.,...
*Catholic AIDS Clinic Montreal, Montreal, Quebec, Canada; **Royal Victoria Hospital, Montreal, Quebec, Canada; ***McGill University, Montreal, Quebec, Canada.

Objective: To describe a research project designed to assess the psychosocial support needs of the HIV antibody positive population of Montreal. Since it is evident to professionals within the health and social service network that the demand for psychosocial services far outstrips the available resources, there is a need for concrete data as to the psychosocial service needs of the HIV antibody positive population. There is presently no concrete data available from the point of view of the affected group. It is hoped that results of the data collection and analysis will enable us to make recommendations to the government with respect to the adequacy or inadequacy of services provided in Montreal.

Method: A questionnaire will be administered to a sample of 300 HIV positive persons attending hospitals and community clinics. The questionnaire will be presented by the physician and trained personnel will be available to answer questions about the patient with assistance.

Results: Some preliminary results of data collected will be presented and discussed.

M.E.P.53 DEVELOPING THE SKILLS OF HOME CARE STAFF IN CARING FOR PEOPLE LIVING WITH AIDS

Cotton Terry, Platt D., London Borough of Hammersmith and Fulham, London W6, U.K.

Objective: To provide a comprehensive package of training and support for staff in order to respond to increasing demand for services and to overcome staff reluctance to work in this area.

Method: After consultation with service managers and Trade Unions to identify key objectives and principal concerns, 1, 2 and 3 day workshops were established to address a range of training techniques. Practical issues have been explored alongside and experiential focus on counselling approaches and personal attitudes. People living with AIDS have provided a major part of the teaching input into the course.

Results: Course evaluations have shown considerable change in attitudes towards HIV and AIDS. The proportion of staff refusing to work in this area has dropped and staff confidence has improved.

Conclusions: Staff training addressing a broad approach to both practical and emotional issues, addressing locally identified staff concerns and incorporating the experience of people living with AIDS can be beneficial in overcoming staff fears and encouraging sympathy with service recipients.

M.E.P.50 A COMMUNITY-BASED AIDS EDUCATION, COUNSELLING AND INFORMATION SERVICE IN THE DISTRICTS OF ADO-21 FOR AFRICA 7
Foster, Geoff, Mutere Provincial Hospital, Mutere, Shabaha

Objective: To establish the Family AIDS Care Trust (FACT), a non-governmental organization with activities carried out by volunteers. FACT is a 100-strong organization which has operated in late 1987 from Mutere churches. Most volunteers were non-medical. In 1988, 40 people completed one of the six 10-hour training courses in AIDS education or counselling which included role-play and community assignments. Funding of \$5000 was raised from many individuals in the community. FACT activities were co-ordinated by a paid secretary.

Results: All information centre, telephone services and window display were set up. Volunteers produced literature, posters and visual aids. Local doctors were consulted. Many patients were referred to FACT for counselling but only 15 attended. Educators used story-telling with appropriate illustrations on flash cards; 70 educational meetings in appropriate facilities etc. were conducted by 25 volunteers. FACT gave support to official agencies responsible for AIDS activities.

Conclusion: Culture and traditional beliefs influence the effectiveness of AIDS programs. Psychological counselling may be inappropriate in African settings. Preventive education using simplified leaflets may be more acceptable and persuasive than mass media campaigns. AIDS prevention programs are feasible in rural communities. FACT's model includes the involvement and training of non-medical appropriate materials and the substitution of other agencies in FACT activities. The program was implemented rapidly with a limited budget and is being extended to other centres. It may be an appropriate model for other African settings.

M.E.P.52 HOSPITALIZED AIDS/ARC PATIENTS PRESENTING DISPOSITION PROBLEMS: IS SIMPLE SOLUTIONS POSSIBLE?

New York, USA.

Objective: To identify demographic/social factors predictive of disposition problems (ALOC) in a large urban hospital. A poor minority community.

Method: Reviewed social work charts for 131 AIDS/ARC patients to identify which demographic/social factors correlated with becoming ALOC. Data for the total group regarding sex, ethnicity, age, risk factor, and degree of family involvement were compared with data for the 24 ALOC patients.

Results:

Factor	N = 131	N = 24	ALOC Group
Male	97	74	12
Female	106	56	50
Black	106	81	22
Hispanic	22	17	93
Other	3	2	-

Of greatest interest is that fully 12 of 31 black females became ALOC. IV-drug-using and heterosexually-infected patients, but not gay males, often became ALOC as well. Age and degree of family involvement had no significant bearing on ALOC status.

Conclusion: The social milieu in which black females acquire HIV disease is a principal factor in their inability to secure proper post-hospital placement. Solutions cannot be simply hospital-based, but must also address broad environmental factors (poverty, racial discrimination, drug abuse, educational parity, and reproductive rights/child placement).

M.E.P.54 ESTIMATING NUMBERS OF PEOPLE LIVING WITH AIDS/HIV INFECTION IN A SMALL URBAN AREA FOR SOCIAL SERVICES PLANNING PURPOSES

Manning, Nicholas
Social Services Department, London Borough of Hammersmith and Fulham, W6, U.K.

Objectives: To develop some planning assumptions about the numbers of people who may be requiring services in a densely populated urban area (population 150,000) with a perceived high incidence of HIV infection. UK National Health Service figures are not available at this level.

Methods: Research was undertaken to ascertain an estimate of the numbers of people living with AIDS, and the numbers unwell with HIV infection, based on the current knowledge of all relevant health and social services agencies operating within the local administrative area. Networking within the voluntary and statutory agencies produced a comprehensive list of all relevant formal and informal agencies and their services. The numbers of people in receipt of each of those services during a three month period was determined. Through extensive liaison, the degree of overlap between groups of services was determined and total estimates of the numbers of residents living with AIDS, and of those unwell with HIV infection, were calculated.

Results: The method produced very considerable co-operation from all participating agencies, and reasonable quantitative estimates were calculated.

Conclusion: A survey of local agencies can produce valuable information about the numbers of people living with AIDS which reflects both the services of the larger agencies and the detailed local knowledge of informal groups and organizations, within a clearly delineated urban area.

Session d'affichage Poster Session

M.E.P.55 ESTABLISHING QUALITY CONTROL TARGETS FOR THE PROVISION OF PERSONAL SOCIAL SERVICES TO PEOPLE LIVING WITH AIDS AND HIV INFECTION

Maning, Nicholas
Social Services Department, London Borough of Hammersmith and Fulham, London W6, UK

Objective: To develop measures of the outcome of an agency's increasing range of personal social services provision as perceived by key groups of service users.

Methods: A consensus approach was employed within a group of practitioners, managers, local agencies, and local residents to identify a series of realistic targets for service delivery by systematically considering the key groups of consumers for whom the agency was providing a service, and the services which the agency could be expected to provide for them. By employing broad definitions of the terms used in the service the Group was able to identify dimensions of the Agency's activities ranging from the provision of information about the agency's services in relation to HIV to Black and Asian residents of its catchment area, to the provision of a consumer's service to people living with HIV infection.

Results: Steps have been taken towards developing a series of realistic targets for the Agency's services along a series of interesting dimensions. The targets will be publicised, along with details of the services, to the Agency in order that monitoring of the extended services can be made public.
Conclusions: Establishing service targets at a time of increasing demand from people living with HIV infection is a feasible exercise, and can successfully appreciate the perspectives of a range of disadvantaged and other interested

M.E.P.56 LOCAL GOVERNMENT PROVISION OF SOCIAL CARE TO PEOPLE LIVING WITH AIDS/HIV INFECTION

Denise Platt, Cotton T., London Borough of Hammersmith and Fulham, London W6, U.K.

Objective: To develop a consultative model of social care provision for residents of an urban local government area with a disproportionately large number of residents living with AIDS.

Methods: Detailed planning systems involving staff at all levels have been explored within an urban Borough to develop a wide range of both practical and emotionally supportive domiciliary and day care services, in co-operation with all other relevant formal and informal organizations. A comprehensive training programme has been established to support the service initiatives.

Results: The London Borough of Hammersmith and Fulham has been able to provide services to over 200 people living with AIDS or otherwise affected with HIV infection. It has gained extensive co-operation from staff and from other agencies working in the field and is recognised as having pioneered many service developments. In particular it is gaining evidence of the confidence of many people living with HIV infection from groups with a traditional antipathy towards statutory welfare services.

Conclusions: An openly participative approach to the planning and development of services enhances co-operation in a sensitive area of provision, and can facilitate access to services for a wide range of individuals and groups.

M.E.P.57 POLITICAL, ATTACK, MEDICAL, COMFORT, PSYCHOLOGICAL DEFENSIBILITIES: FACTS AND EFFECTS OF AIDS POLICES IN BAVARIA, WEST GERMANY

Beatrice Wipperfurth, Jäger, H.M., Hummel, G.M., Weber, U.*
*Institute for Medical Information and Health Services Research/DFG
** AIDS Study Group, Schwabinger Krankenhaus, Munich, FRG

Background: For PWA in Bavaria, the government's tough position in relation to AIDS is contrasted by the high standards of a number of medical institutions providing AIDS care.
Objective: Description of the psychosocial situation and behavioral patterns of persons with AIDS under Bavarian conditions.

Methods: Survey of out-patients assessing medical care and psychosocial support systems; multi-stage sequential reevaluation of AIDS-consulting agencies.
Results: 187 HIV-infected patients (80% homosexual men, 20% WDA, 16% female, 21% in stage II of the WPA classification) were asked about their attitudes towards AIDS-related care. 30% of them used more than one medical institution parallel. Contrary to their needs expressed, a majority of the respondents tended to underestimate psychosocial support systems. Homosexual men and severely ill patients described the care systems in a rather positive way whereas WDA, younger patients and those in earlier stages of disease were more critical of it. Community-based organizations are increasingly forced to perform a tightrope act between the concerns of their (potential) clients and the demands of authorities, between voluntary self-help work and the need for professionalization.
Conclusions: The ambivalence of the Bavarian AIDS situation (politically deterrent, medically attractive) puts psychosocial support for PWA into an important as well as ambiguous position. Four of political (de)institutionalization increases the need for psychological assistance but also acts as a barrier against using the relevant facilities.

M.E.P.59 "WE HAVEN'T DEALT WITH MUCH OF THAT YET": HELPING MEDICAL HEALTH PROVIDERS PREPARE TO WORK WITH HIV-RELATED CLIENTS

Detach, D.* **Quackenbush, Maria,*** **Martin, R.†**, **Schwartz, M.****

*University of California AIDS Health Project, San Francisco; **California Department of Health Services, Office of AIDS

Objective: To address the problems in the HIV incidence areas whose mental health and social service providers (MH/SSP) are not prepared to work with clients with HIV related concerns.

Methods: In six major regional areas of California, MH/SSP have not seen HIV related cases so far, are not familiar with the relevant issues, and may be apprehensive about providing services (or unwilling to do so). Individuals in these areas receiving positive HIV antibody results or dealing with other HIV related issues often have few resources for counseling support. A train-the-trainers project will be described which offers in-depth training to selected providers in regional areas, then provides them go on to train their colleagues on issues related to HIV and mental health.

Results: By May 30, 1988, four three-day trainings will have been provided throughout the state of California; and participants in those trainings will have gone on to train an additional 900 individuals by June 30. Preliminary evaluation of the program's success will be presented. The complete training manual will be available for review.

Conclusions: A program of this type can expand response and contact among MH/SSP, thereby improving the quality of resources for the client population. The program's success will be presented.

Supported in part by a grant from the California State Office of AIDS, contract # 88-94560.

M.E.P.58 HIV INFECTION, AIDS AND MENTAL HEALTH: THE CANADIAN NATIONAL WORKING GROUP'S EXPERIENCE

BOB LANGRISH (in English); **YVES JOHANNES** (in French) and **Members of the National Working Group on HIV Infection, AIDS and Mental Health, Federal Centre for AIDS, Ottawa.**
Hospital: St Paul Hospital/University of Toronto, Toronto, Ontario, Canada
Psychologist, Private Practice, Montreal, Quebec, Canada

Objectives: (1) to provide an evaluation of the state of mental health service delivery in Canada, as it responds to those affected by HIV; (2) to make program recommendations.

The National Working Group on HIV Infection, AIDS and Mental Health convened in December 1985. The 14 members include representatives from across Canada. They encompass social work, nursing, theology, behavioral sciences, research, psychology, psychiatry. The group identified 4 main areas of concern: (1) need for a clear definition of mental health as it applies to persons affected by HIV; (2) identification of "special" groups and the implications for service, education and research; (3) the mental health of health care providers serving people affected by HIV; (4) need for a suitable model of care. The group recommends: a needs assessment be done to determine existing mental health services, models and gaps; mental health care needs of health care providers be determined and program/service developed; centres of excellence to which mental health care workers can go to train be developed; current or proposed legislation regarding HIV infection, that affects the mental health of Canadians be addressed by this working group; methods to encourage research and education into the mental health aspects of HIV infection be developed.

M.E.P.60 SOURCES OF DELAYED HOSPITAL DISCHARGE FOR AIDS PATIENTS

Widman, Mandy Light; D.V.† **Platt, J.J.***
University of Maryland School of Medicine, New Jersey-School of Osteopathic Medicine, Department of Psychiatry, Camden, New Jersey, U.S.A.

Objective: Determine the social/environmental factors contributing to delays in hospital discharge for AIDS patients, rank them in order of importance, and determine if any differences exist by race/ethnicity or sex/race.
Methods: Interviews were conducted at 13 agencies in 5 cities (Baltimore, Boston, New York, San Francisco, Washington, D.C.). Respondents (N=17) were asked to list factors delaying discharge. The Delphi technique, in which respondents individually and without consultation rank the listed barriers, was used to gain consensus over 3 consecutive Delphi rounds. Variation scores were used to rank all items after each round.

Results: An absence of supportive housing and all levels of nursing home beds exacerbated by inappropriate/ inadequate insurance were ranked highest overall. There was, however, variability for IV drug users (IVDU) where the lack of caretakers or caretaker skills was found most important. Great variations in barriers to discharge were also found among the cities.

Conclusions: As treatments for AIDS improve and patients live longer, more attention will have to be paid to their chronic care needs. Understanding the services required by different populations or in specific regions is necessary for effective allocation of resources. For example, hospital discharges for IVDU appear to be blocked after less serious episodes of illness by the absence of skilled support services. In addition, the need for patients to remain hospitalized later in the syndrome's progression due to an absence of supportive housing or nursing home beds, each of these requires that different financial and personnel commitments be made.

M.E.P.61

POST-DISCHARGE HOUSING OF HIV INFECTED PATIENTS IN ROME
L. Biondi, R. Ammendino, G. Antonucci, G. Biondi,
L. Spallmann; Hospital for Infectious Diseases, Rome, Italy.

Objective: To determine if homelessness in HIV infected patients is determinant for pressure on infectious disease units and to assess social needs for such patients in terms of suitable post-discharge housing.
Methods: In Italy, departments of infectious disease manage more than 80% of AIDS patients. It has been suggested that the lack of suitable post-discharge housing is a major factor in determining the long stay in hospital after acute care. Presently chronic long term facilities are limited in Rome and extensive home health care is not available. Epidemiological, demographic and social data of 101 AIDS patients and 345 HIV asymptomatic subjects hospitalized from 1981 to 1985 were reviewed. 100% were male, 95% were from Rome. The distribution by risk group of the 146 HIV infected patients (340 males and 90 females) was: intravenous drug addicts (IVDA) 72.6%, homosexual males (HMA) 14.1%, heterosexual contacts 9.4%, ITDA + prostitutes 3.4%, homosexual males + IVDA 3.1%, transfused 1.6%. Out of 101 AIDS cases, 3 patients were females by the family and died in hospital because the lack of social support. 1 want to hospital, 3 were accepted home by parents. Out of 345 subjects with HIV asymptomatic infection, 25 were accepted in a therapeutic community for medicalization program, 9 went to hospital without medical assistance and 9 were accepted by parents.
Conclusions: Systematic and comprehensive services for people with HIV infection must be encouraged through public sector and non professional caregivers. Presented data are relevant for planning size of services and alternate resources.

M.E.P.63

NEEDS ASSESSMENT OF PERSONS WITH AIDS AND HIV
ILLNESS IMPLICATIONS COMMUNITY COORDINATION
SERVICE PLANNING IN A LOW INCIDENCE COMMUNITY
Curtis Richards*, Coleman, D., *Zelinski, D.,
*United Way of Columbus, **Columbus Health Department,
***Metropolitan Human Services Commission, Columbus, Ohio, USA

Objective: To measure the perceptions of local PWAs and HIV positive individuals regarding unmet needs, awareness of existing community services, and the importance of these services to plan community response.
Method: A written survey instrument was designed to collect this information as part of a comprehensive AIDS-planning effort. The survey was developed with the input and support of local PWAs and AIDS service agencies. The instrument was 23 pages, over 120 questions and took 45 minutes to complete. Over 600 surveys were distributed through physicians and direct service agencies; 110 were returned and analyzed. While not a random sample, the results closely resembled the current known incidence of AIDS, ARC, and HIV seropositivity. Responses were both anonymous and confidential. Survey results were compared with a similar survey of service providers.
Results: Respirie care, mental health care, income subsidy, dental care, legal assistance, and patient information were ranked as the greatest unmet needs. Responders were generally uninformed about the availability of existing human services. Most needs (50-75%) were being met by friends and family.
Conclusions: Community planning efforts need to focus on (1) strengthening PWAs' existing networks of informal support systems; (2) ensuring that PWAs can access existing human services.

M.E.P.65

HOSPITAL ILLNESS AND VISITATION PROGRAMS PROVIDE EMOTIONAL SUPPORT, ADVOCACY AND LINKAGE TO COMMUNITY BASED ORGANIZATIONS FOR HOSPITALIZED PWA/PWAR/Cs.
Jan. S. Beigman, D. J. Gendron, S. J. Gendron, M. Michael,
AIDS Project Los Angeles, CA, U.S.A.

Objective: To provide emotional support, advocacy and information regarding community services to PWA/PWAR/Cs hospitalized in Los Angeles County. To provide greater linkage among hospitals serving these clients.
Methods: APLA recruited 87 full time employees from 60 hospitals who, by virtue of their position, have access to provide supportive PWA/PWAR/Cs. Once the illness was identified, APLA recruited and trained 42 volunteers for 13 hospitals to visit hospitalized with AIDS/ARC. Volunteers training includes active listening, hospital protocol and AIDS specific medical and psychosocial information. The hospital illnesses act as resource persons for the volunteers. Hospital illnesses meet quarterly as a group for networking and support. Visitation volunteers meet as a group for supervision and support monthly.
Results: Volunteers provide emotional support, advocacy and information about community and APLA services. Hospital staff report the volunteers to be an asset to patients and staff, particularly in that they are able to spend more time with sicker patients. Information regarding CPTG's leads to more timely linkage to these services. Also, the illness and visitation programs provide opportunities for networking and mutual support for the staff for participating hospitals.
Conclusions: These programs provide an effective model for providing emotional support, advocacy and information regarding community resources to AIDS/ARC patients when they are very vulnerable, i.e., during hospitalization. These programs help these participants alleviate stress/burnout and enable them to maximize scarce resources.

M.E.P.62

DEVELOPING COMPREHENSIVE SERVICES FOR HIV INFECTED INTRAVENOUS DRUG USERS: A GUIDE FOR CASE MANAGERS
Glenn Finkbein, Byron, C.S.M.,
Bronx-Lebanon Hospital, Bronx, New York, U.S.A.

Objective: To develop a system of comprehensive case management that addresses the multiple needs of HIV infected drug users.
Methods: I.V. drug users have numerous problems that complicate medical treatment. These include personality disorders and social problems that lead to noncompliance, failed appointments and physical/emotional suffering. Comprehensive case management requires addressing of concrete needs: system negotiation, counseling, drug treatment, etc. Most important is the development of resources for individuals at all points of the HIV continuum (asymptomatic, ARC, AIDS) via networking, outreach and mutual contacts.
Results: Needs of the IV drug user are identified and discussed in terms of treatment implications, solutions and impact on the patient, significant others, professionals and society. A framework for developing an individualized, comprehensive case management system, including resource development, is offered. **Conclusions:** Case managers that consider all aspects of the patient's treatment while developing additional resources is crucial for the care of HIV infected drug users. A systematic approach ensures inclusion of all factors while simplifying this formidable task for the case manager.

M.E.P.64

COMPREHENSIVE VOLUNTEER PROGRAM FOR PEOPLE WITH AIDS
Sandra Swanson, Miller, S.,
Center for Special Studies, New York Hospital-Cornell Medical Center, New York, N.Y., U.S.A.

Objective: To provide essential medical, practical assistance and to ensure link with professional staff for hospitalized and ambulatory people with AIDS. Through bi-monthly home contact, to reduce the numbers of unnecessary emergency room visits and to increase staff awareness of patient's home situation.
To provide formal support to volunteers to maximize their effectiveness.
Methods: Recruitment and training program which provides volunteers with an intensive, inpatient program taught by professional staff. A volunteer in-patient training program in which 25 patients are visited per week by 15 volunteer carers. An on-going monthly support group led by social worker to assist volunteers with their own coping. A telephone reassurance program in which 184 calls were made on a bi-monthly basis over a three month period to 25 patients by 7 volunteers. Volunteers provided practical and emotional support to 77 applicants and their families during clinic hours. Supervision of the program provided by two clinical social workers. **Results:** Study of 15 hospitalized patients reported their first home visit, fearful and anxious after visits from volunteers as compared to 15 patients not seen by volunteers. Percentage of discharged patients who have volunteers from their inpatient stay kept their first appointments at a higher rate than those who did not have volunteers. Their behavior on first visits was more relaxed and patients were able to more effectively negotiate hospital system. Less frequent visits to the clinic and emergency room by these patients called on a regular basis for non-medical concerns. **Conclusions:** This program has contributed to the effectiveness of self-referral of patients with AIDS. It has provided patients and families with a consistent group of experienced and caring individuals linking them to the professional team. It provides the staff with ongoing reports on vital information on ambulatory patients between visits. The mutual respect and support between volunteers and staff has contributed to the success of this program.

M.E.P.66

THE IMPORTANCE OF THE SOCIAL SERVICE EXPERIENCE AT A UNIVERSITY HOSPITAL IN THE USE OF AIDS TO HIV INFECTED INDIVIDUALS.
MURPHY, JAMES (LINDA LITTLE), MURPHY, E.M.M., OLIVEIRA, E.A. and MERRIS DE SA, C.A., U.S.A.
Griffin & Guthrie Hospital, University of Rio de Janeiro (UNIC-RJ) - Brazil.

Objectives:

- 1) Identify the meaning of AIDS to HIV infected patients, their family members, friends and health care workers.
- 2) To assess the reasons for discrimination of HIV infected individuals.

Methods: The study comprised 170 infected individuals, 73 family members and friends of these individuals and 100 health care workers, from February to December, 1985. They were interviewed by two social workers who used a phenomenological approach and follow-up.

Results: The meaning of "AIDS" and the reasons for discrimination were related to:

	PATIENTS		FAMILY		HEALTH CARE WORKERS	
	N	%	N	%	N	%
Lack of information	133	78	21	29	28	40
Insufficient information	133	78	21	29	28	40
Lack of confidence or information obtained	100	59	16	22	15	21
Difficulty related to sexuality/						
Homosexuality	96	56	17	24	29	42
Difficultly to face women	100	59	16	22	15	21
Lack of medical/health resources	100	59	16	22	15	21
Lack of financial resources	100	59	16	22	15	21
Lack of emotional support	130	76	21	29	25	35
Lack of family support	100	59	16	22	15	21
SOCIAL SERVICE	100	59	16	22	15	21

Conclusions: wherever the educational needs of AIDS to HIV infected individuals and their involvement activities beyond the patient and the disease. We believe in the need to continue to improve the social service experience in the diagnosis, classification and broader utilization of the process.

Session d'affichage Poster Session

M.E.P.67

SOUTHERN HARMATION WOMEN AND CHILDREN HIV DEMONSTRATION PROJECT: SOCIAL SERVICE ISSUES
Patrice Chokler*, K. Andrew*, C. Hulton*, V. Walner**
 Joann Johnson**¹, R. V. K. L., *McGill University, N.Y., N.Y., **Mount Sinai Hospital, N.Y., N.Y., ***Saint Luke Hospital, N.Y., N.Y., U.S.A.

Objective: To increase regional communication and coordination of resources for HIV infected or at risk women and children, and to suggest the provision of health education, social services and clinical care in an area where service delivery and health education efforts are fragmented and there is a documented rise in HIV infection. To identify the service needs experienced and the ethical questions faced by participating women.

Methods: The establishment of a consortium model, funded by Health Resources and Services Administration, Bureau of Maternal and Child Health, includes five voluntary and public agencies, three branches of city government, a State Services Administration, a community based task force of providers and a school of public health, a community based task force of providers and a major clinical research center. The consortium incorporates a social services committee which captures the collective experience of providers with similar populations in varied settings.

Results: Participating agencies have developed a shared set of goals and objectives, a uniform evaluation instrument and a forum in which problem-solving is enhanced.

Conclusion: The model effectively strengthens the group's ability to advocate for increased and augmented services for women and children and to identify helpful approaches to ethical decision-making.

M.E.P.69

SOCIAL SERVICE NEEDS OF PEOPLE WITH AIDS: PERCEPTIONS OF NEED AND COST NEED
Fialama, John* Platte, J.* Nor, V.*
 *Yrums University, Providence, Rhode Island, U.S.A.

Objective: To describe needs for social services as reported by people with AIDS.

Methods: In-person interviews were conducted with 27 clients of the Robert Wood Johnson Foundation's AIDS Health Services Program. Clients were interviewed at site outside the UR. For each of 12 social service needs (e.g., medical, home visiting, support groups, transportation, housing placement, dental care), respondents were asked (1) if they needed that service, (2) how much they needed it, (3) if they received it, and (4) whether services received met their needs.

Results: The highest proportion of responses (49%) expressed a need for dental care, followed by needs for support groups (44%), counseling (41%), and legal advice (40%). Lowest reported needs were for homemakers (13%), meals at home (15%), housing placement (13%), and drug rehabilitation (11%). The most intensely felt, unmet need for housing placement, medical, and drug rehabilitation. Only 21% of those who needed it received dental care; only 38% who needed it got housing placement. Of those receiving services, at least 70% said that their needs were met for each service, with the exception of money for housing (50%). Those who were employed had fewer needs. Compared to gay men, drug users perceived greater need for home nursing and for medical.

Conclusion: Dental care is an often overlooked and unmet need. Needs for housing, although not prevalent, are intense and hard to meet.

M.E.P.71

A MULTI-DISCIPLINARY MODEL FOR DECISION-MAKING AND CASE PLANNING FOR HIV-INFECTED CHILDREN & YOUTH IN CHILD WELFARE AND CHILD PROTECTIVE SERVICES SYSTEMS
Anita J. Burr*, Rose J.J.* Potts, K.** *Child Welfare League of America **Massachusetts Department of Social Services, W. Mass.

Objective: To provide service providers in the public and volunteer sectors a decision-making model to approve or recommend case decisions in order to establish a standard of practice and support the willingness of agencies to serve HIV-infected children in the face of varied fears, e.g. liability.

Methods: CWLA convened administrators from 17 public child welfare agencies to identify problems in mobilizing their bureaucracies to serve HIV-infected children and youth. They identified supporting decisions made as a significant barrier. The Massachusetts Department of Social Services and CWLA proposed and described a multi-disciplinary review team model; CWLA received 289 responses from 250 agencies surveyed re: challenges faced; decisions made; methods used; and conclusions reached; Massachusetts DSS tested and operationalized the model.

Results: Among obstacles agencies face making case planning decisions for infected children are: 1) resistance to serve without assurance of financial contact; 2) conflicting confidentiality and testing policies and beliefs; and 3) liability and risk management concerns.

Conclusions: A multi-disciplinary review team's validation of case-planning decisions speeds agencies' responses.

M.E.P.68

GROUP RESIDENCE AND SCATTERED SITE APARTMENTS AS HOUSING FOR HOMELESS PERSONS WITH AIDS
Diener, Douglas*, Sandler, K. and Noyak, L.*
 *Haley House, New York, NY, USA.

Objective: To provide supportive housing for homeless persons with AIDS.

Methods: A 6 person group residence was established in N.Y.C., supported by government funds and private donations. In addition, 20 scattered site apartments were leased by the sponsoring agency. The 2 programs were separately staffed but concerned needs and problems.

Results: Staffing included social services, nursing, pastoral care and support services. Average length of stay in the group residence was seven months, and eight months in the apartments. About one-third of residents in the group residence pass away in their respective homes cited in the following admission for acute medical care. In the group residence, medical care was provided by referral to hospitals and clinics. In the group residence, 50 persons were served in two years; in the apartment 90 persons were served in three years.

Conclusions: Homeless persons with AIDS are in need of housing. Homeless persons encounter difficulties in providing appropriate support and structure for residents with AIDS psychiatric and behavioral problems. A combination of housing and individual service plans was effective in most cases, but residents who were physically destructive or who threatened the safety of others were referred to various other settings.

Conclusions: Scattered site apartments and group residences both provide appropriate housing for persons with AIDS who do not need medically assisted care.

M.E.P.70

STEP DOWN CARE ACCEPTABILITY IN HOSPITALIZED AIDS PATIENTS
Kozminski, Bruce* Prival, T.* Dayo, M.*, deGroot, David* Wood, R.**
 *University of Washington, Seattle, Washington, U.S.A.
 **AIDS Prevention Project, Seattle, Washington, U.S.A.

Objective: To determine the acceptability of special AIDS residences with skilled nursing ("step down care") among hospitalized persons with AIDS. Patients obtained medical, behavioral, and social services with AIDS during their hospitalizations, and interviewed them regarding the acceptability of step down care as an alternative to a long-term hospital stay or to home care. We also interviewed their doctors, nurses, and social workers regarding appropriateness of such a care setting for such patients.

Results: Of the 100 AIDS patients (all males, mean age 38 yrs), 56 found step down care to be acceptable in concept during their hospital stay (although 21 of these felt home care would be equally as acceptable). Of these 56, 50 social workers (all 3) 9 were discharged to such settings (nursing home and hospices), 6 admitted to the hospital, and 5 went home (with home care). Of the 44 patients who felt step down care was an unacceptable option, the majority (42 or 95%) wanted to receive their care at home (21 wished to stay in the hospital). Of these 44, 11 were considered appropriate for step down care by their caregivers; 9 went home (5 with home care), 1 went to a hospice and 1 died. Of the patients who found step down care acceptable, none went to such settings at discharge or expired in the hospital (15 of 56) than those who did not find step down care acceptable (2 of 44) (7% vs 9%, p=0.01).

Conclusion: Hospitalized persons with AIDS willingly accept their desires for various care settings following hospitalization. A majority feel step down care would be acceptable, but many patients prefer home care.

M.E.P.72

COMMUNITY-BASED CARE FOR PEOPLE WITH HIV DISEASE
Rubin, Howard* and Sacks, R.* Mount Sinai Medical Center, New York, New York

Objective: To develop models for comprehensive community-based care for people with HIV disease (1988).

Methods: We interviewed representatives from AIDS service organizations (ASOs) in New York, San Francisco and Chicago and observed their operation. We called promotional material from ASOs across the USA and examined how they incorporate care of their local communities and of their clientele into viable systems of care.

Results: We describe the basic elements of care which may be necessary for ASOs to develop adequate services for PWAs: 1. The existence of community clinics which can provide primary health care to PWAs and which offer anonymous HIV antibody testing and counseling. 2. A mechanism for recruiting and training volunteers to serve the emotional and practical needs of PWAs, their friends and families. 3. Advice for PWAs concerning their legal rights, appropriate medical care, access to government aid, and experimental protocols. 4. Assistance with housing and food. 5. An AIDS hotline and other educational services. 6. Outreach for intravenous drug users. 7. Coordination of services with local hospitals.

Conclusion: An appreciation of the basic needs of ASOs provides may help local communities develop services which offer competent, humane, and comprehensive care for PWAs.

Le SIDA, la société et le comportement AIDS, Society and Behaviour

M.E.P.73 THE CHALLENGE OF AIDS IN AN AREA OF SCATTERED POPULATION AND LOW PREVALENCE Tuxton, PAI

Regional Joint AIDS Community Support Centre, 52 Clifton Road, Newcastle upon Tyne NE4 8QJ England.

Our AIDS and HIV figures are "normal" for the U.K. and very much lower than London - 28 AIDS cases and 214 diagnosed as HIV positive. We have encountered serious obstacles in pursuing our aim of developing non-hospital based care. Among the issues I would like to discuss are:

1. Medicalisation of care of people with AIDS.
2. Protective/possessiveness of established carers - largely medical.
3. Lack of confidence of people with AIDS and medical providers in social workers.
4. Non-availability of AIDS as an issue in areas of normal (low) prevalence.
5. Social workers' perception of being de-skilled by HIV and its implications - is this an appropriate or inappropriate response?
6. Training - who and how to target training to social workers when AIDS is seen only in theory as a priority area, and in practice is seen not to be relevant to most social workers in a local authority.
7. Non-availability of substantial, vocal and cohesive groups of people with AIDS.

M.E.P.74 COMPREHENSIVE SOCIAL SERVICE HIV SERVICES PROGRAM AT WALTER REED ARMY MEDICAL CENTER, WASHINGTON, D.C. O'Neill, Robert H., Social Work Service and the Walter Reed Microvirus Research Group, Washington, D.C., United States of America.

Objectif. To identify and describe 20 clinical psychosocial treatment and health care management components utilized in the development and implementation of a comprehensive social service program for HIV infected individuals, family members and health care service providers.

Methods. Twenty psychosocial treatment/intervention procedures and health care management components were developed based upon policy review, problem identification, needs assessment, literature review, patient surveys and research findings. The resulting components were utilized in developing, implementation and providing a comprehensive social service program for HIV infected individuals, family members and a supportive program for staff.

Results. The table below summarizes the 20 components:

- | | | |
|-------------------------------|---------------------------|-------------------------|
| 1. Priority and justification | 8. State-process | 15. Substance-abuse |
| 2. Services and treatment | 9. Self-administration | 16. Role development |
| 3. Process and content | 10. Coping-affect | 17. Management-forensic |
| 4. Rehabilitation | 11. Technology-complexion | 18. Integration |
| 5. Practice and research | 12. Content-contrast | 19. Ousey traces 12/89 |
| 6. Treatment and care | 13. Evolutionary process | 20. Predictions |
| 7. Multidisciplinary | 14. Threshold level | |

Conclusion. A comprehensive HIV retrovirus social service program was developed and implemented based upon 20 psychosocial and management components.

M.E.P.75 CHERCHER UN MILIEU DE VIE: UNE APPROCHE ARCHITECTURALE INNOVANTE

RENÉE, HALLÉ Montréal, P.Q., (Québec, J.***)
* Corporation Héliobus/Héliobus, Montréal, Québec, Canada; ** Héliobus de Montréal, Montréal, Québec, Canada; *** Héliobus Montréal, Montréal, Québec, Canada.

Le milieu d'Héliobus se veut une alternative qui longe sereuse au milieu hospitalier. **OBJECTIF:** créer un milieu de vie pour les personnes atteintes qui soit adapté à leurs besoins. **METHODS:** le projet a été élaboré par une équipe multidisciplinaire composée de médecins, travailleurs sociaux, architectes, administrateurs, personnes atteintes. Le projet a fait l'objet de consultations auprès d'autres groupes ou individus impliqués dans l'intervention auprès des personnes atteintes ou ayant développé un projet établissant un lien de confiance personnelle. Les différences d'opinion de la méthode et les besoins spécifiques y sont traités au 4^e congrès. Le type et la qualité de l'intervention ainsi que les besoins des intervenants ont été clairement établis.

REMARKS: Le choix de vivre en un concept architectural qui réunit une rénovation sur un bâtiment ancien à une construction neuve impliquant d'une préoccupation majeure de créer un milieu de vie répondant aux différents besoins des personnes atteintes:

cadre de vie familial; ancrage dans la communauté; vie communautaire en un même temps qu'intimité; autonomie - semi-autonomie - surveillance; besoin de sécurité et besoin de liberté; alléger - recueillir et communiquer - exprimer; présence continue; soins et support à la vie quotidienne;

aménagement médical léger; activités récréatives et artistiques. **CONCLUSION:** Un concept architectural pourrait pour servir 11 personnes atteintes. L'impact élargi par médias en fonction des besoins et des activités permet de répondre à une variété de situations à différents stades de la maladie.

M.E.P.76 DESCRIPTION ET ÉVALUATION DU SERVICE TÉLÉPHONIQUE INTÉGRÉ DE LA PROVINCE DE QUÉBEC POUR LE SIDA ET LES AUTRES ITS.

Duval, Bernard; Bédard, N.; Fortin, G.; * Unité de recherche-Laval, Québec, Canada; * Centre régional de la Santé et des Services sociaux (CRSSS QJ), Québec, Canada.

Objectif. Analyser le fonctionnement d'un système téléphonique provincial pour les ITS-SIDA intégré à un service général d'informations sur la santé. On a mis sur pied en septembre 1987, un service téléphonique de renseignements sur les maladies transmissibles sexuellement (ITS) qui fonctionne 24 heures par jour et 7 jours par semaine. Le service est bilinéaire et accessible gratuitement pour les 6 millions d'habitants de la province. Appelé INFO-ITS, il est intégré à un système d'information générale sur la santé, INFO-SANTÉ, qui est basé au CRSSS QJ et sert la région immédiate de Québec.

Un échantillon aléatoire de 1157 appels a été analysé à partir des fiches 31,8% des appels. Par comparaison avec les autres ITS, ceux qui appelaient pour parler du SIDA étaient plus souvent des hommes (44,5% contre 36,7%) et moins fréquemment des jeunes de moins de 20 ans (20,8% contre 26,8%).

Parallèlement aux appels concernant le SIDA, 87,5% demandaient de l'information. 18,3% des conseils thérapeutiques et 28,6% une référence à un service clinique. Pour les autres ITS, on observe respectivement 70,7%, 26,2% et 35,4%. **Conclusion.** On constate la pertinence d'un service téléphonique de renseignements sur le SIDA. Le jumelage avec un service d'informations sur la santé permet d'améliorer beaucoup l'accessibilité car le volume d'appels autorise une permanence continue qui serait trop onéreuse autrement.

Éducation (partie 1) Education (Part 1)

T.E.P.1

REPORTED LIKELIHOOD OF SEXUAL ACTIVITIES WITH A NEW PARTNER IN A SURVEY OF BAR PATRONS IN A LOCAL GAY COMMUNITY.
Martin, David J., Edwards, C.W., and Geiger, R.***
***AIDS School of Medical Center, Torrance, California, **AIDS Intervention Project, Long Beach, California, USA.

Objective: To survey current sexual activities to determine current and future risk-reduction education needs of the local gay community.
Methods: An exit survey was administered to local gay bar patrons, requesting demographic information, information on participation in local AIDS-education programs, whether or not respondents had been tested for HIV antibodies, test results (if applicable), changes in sexual behavior, number of partners, location(s) where respondents met new partners, and likelihood of various sexual behaviors with and without condoms with a new partner.
Results: Most respondents reported meeting new sexual partners at bars. The following behaviors were relatively unlikely with condoms and likely without condoms: mutual masturbation, receptive oral sex, and insertive oral sex. The following behaviors were rated relatively likely with condoms and unlikely without condoms: insertive anal sex, receptive anal sex, ejaculation inside partner, and receptive anal sex with ejaculation. HIV antibody testing seemed to have no effect on reported likelihood of any behavior, but seropositive men reported that they were less likely to engage in receptive or insertive anal sex than seronegative respondents regardless of condom use.
Conclusion: Gay men reported significant changes in their sexual behavior that appear to substantially reduce the risk for HIV transmission. The relative likelihood of unprotected oral sex in the absence of definitive information regarding its risk suggests that research on the associated reasons for and the risks of this behavior is needed.

T.E.P.3

ADAPTATION OF SAFER-SEX WORKSHOPS FOR GAY AND BISEXUAL MEN IN BARCELONA, SPAIN.

Wohlfeiler, Daniel A., Frutuchy, C., de Blasi, R.,***; Prosepe, A.,*** (University of California, Berkeley, USA); Spain Francisco AIDS Foundation;*** made per Ja Salas, Barcelona;***AIDS Program, Generalitat de Catalunya, Barcelona, Spain.)
Objective: To adapt, conduct and evaluate workshops, originally designed to promote behavior and more change in U.S. gay and bisexual men, for use in Barcelona, Spain.
Methods: Gay for Health, a Barcelona community-based organization, began these workshops in December, 1988, with U.S. and Barcelona facilitators. Publicity was distributed to gay bars, bath houses, bookstores, and through the media.
Results: 31 men attended the two pilot workshops. SEI agreed that the workshop helped them feel more comfortable talking about safer-sex; 79% agreed the workshop helped them believe safer sex could be fun; 79% that the workshop helped them feel more capable of controlling AIDS. At the end of the workshop, participants were asked to list at least three safer-sex activities. 94% of the responses were correct; 33% referred to avoidance of unsafe behaviors. A process evaluation revealed that participants perceived role-players (i.e., negotiating safer sex with a partner) to be less useful than brainstorming (i.e., discussing AIDS and safer sex in large groups).
Conclusion: 1) Interventions targeting gay populations in one culture may be adaptable for use in another; 2) Recording participants' responses provides an excellent source of information on knowledge, attitudes and behavior of the target population.

T.E.P.5

AIDS EDUCATION: USING COMMUNITY TELEVISION TO REACH GAY MEN AND BISEXUALS
Sobota, Michael, AIDS Committee of Thunder Bay, Thunder Bay, Ontario, Canada

Objective: To deliver education about AIDS, particularly about safer sex practices, to gay and bisexual men.
Methods: Utilizing public, community television which included negotiations with television station management, training of volunteer technicians and support staff, designing and producing [content, format, graphics] taping and airing programs including live, on-air phone in sessions.
Results: AIDS education programs commenced on community television from October 1988 through April, 1989. Written feedback [correspondence] and direct contact from phone-in programs indicate viewer interest and positive response. Some controversy concerning language and content with resulting intervention of public officials. Conflict resolved in favour of program continuing to be aired.
Conclusions: Community television is an important media to access difficult to reach targeted populations. Community television can be utilized at little financial cost, if there is a volunteer pool available. Community television relies volunteers from within the gay and lesbian community if they see the project to have real and specific benefit to their brothers and sisters.

T.E.P.2

AIDS-PREVENTION ACTIVITIES TARGETING HOMO-AND BISEXUAL MEN
Michael von Hippel, Deutsche Aids-Hilfe e.V., Mestorfstr.-8
1000 Berlin 31, West-Germany

Objective: The main objective is the fight against the spread of HIV-infections. Homo- and bisexual men are extensively informed. Their collective and individual identity is strengthened. Lifestyles and sexual behavior are accepted and as there is little intervention a considerable prevention effect is achieved. The Safer Sex message is transmitted through existing structures within the gay sub-culture. One-way media as well as interpersonal communication are offered. Apart from an employed staff volunteers and even bartenders are prepared for counselling services. Lapulas are given by gay-swaps. There are no prohibitions neither in words nor in pictures. We confine ourselves to give advice in regard to lifestyles and sexual behavior. Social problems and personal fears are individually treated and anonymously discussed in public. The work is supported by public relations.
Results: The study "CHANGES IN SEXUAL BEHAVIOUR OF GAY MEN UNDER THE IMPACT OF AIDS" (1987), a follow-up study made in 1988 as well as further observations (such as the decrease of rectal gonorrhoea) show that the low-risk sex has proved to be accepted by an important sector of gay men in West-Germany. **Conclusion:** By this prevention strategy the rate of infection has been reduced considerably. It has not been proved that similar results can be achieved by means of official measures.

T.E.P.4

SOURCES OF INFORMATION ON AIDS IN ZAIRE AND IMPLICATIONS FOR PROGRAM PLANNING
Lussabaine R.**, Sorens, Helaine, **, Wassig JE. **, Bertrand WE. **, Bahula T.,**
** Zaire School of Public Health, Kinshasa, Zaire
** Tulane University, New Orleans, USA

Objective: To determine sources of information on AIDS in Zaire and desired sources of communication for the future.
Methods: Two populations were surveyed during 1987-1988: 3500 health workers (HW) of all levels throughout Zaire and 2500 employees and spouses (ES) at a commercial bank in Kinshasa. **Results:** HW have learned about AIDS from radio (59%), written materials (29-38%), television (TV, 28%), courses (12%) and discussions (10%). For ES, sources were radio (51%), TV (43%), written materials (11-25%) and discussions or songs (2%). For HW, mass media and written materials are preferred in urban areas, courses and discussions in rural areas. Among ES, mass media and written materials are preferred by male employees, while their female spouses prefer face to face communication. The preferred language for HW is overwhelmingly French; among ES, male employees prefer French, and female spouses prefer Lingala, the local language in Kinshasa.
Conclusions: AIDS education programs should specifically consider the setting (urban/rural) and the audience (HW, lay population), including different strategies according to sex, educational level, profession and language preference.

T.E.P.6

LES EFFETS D'UNE CAMPAGNE GRAND PUBLIC SUR LES HOMOSEXUELS FRANÇAIS

Michael Pollak, Pierre Boisson**, *CNRS, GSPM, **Gal Pled Hebdo, Paris, France.

Objective: Evaluer les effets de la campagne télévisée "Le SIDA, il ne passera pas par moi" (1987) sur les attitudes et comportements des homosexuels français.

Méthode: Sondage par questionnaire (n=1 500) inséré dans une revue homosexuelle.
Résultats: Bien qu'elle ait réussi à capter l'attention des gays (78% de mouvement du regard), cette campagne est jugée peu claire, floue, peu explicite et "utile pour les autres" plutôt que pour les gays. Les moins de 25 ans sont les seuls qui, grâce à la campagne, ont accéssé leur adaptation sexuelle au risque. Les moins motivés par la campagne sont les classes populaires.

Conclusion: Pour avoir un effet incitateur important sur les homosexuels, la campagne télévisée est arrivée trop tard, avec un message trop limé. Les campagnes grand public, efficaces par les homosexuels dans le groupe d'âge des moins de 25 ans, n'ont pas à toucher les homosexuels des classes populaires. La prévention devra tenir compte de ce phénomène dans des actions de proximité spécifiques.

T.E.P.13

FIGHTING AIDS - AN EDUCATIONAL MODEL FOR ARMY UNITS

Scheiner Inc., School of Public Health and Community
Medicine, Hebrew University-Hebrew Medical Faculty, Jerusalem, Israel

Young men and women who serve in the armed forces of their countries are an important target group for AIDS prevention campaigns. Data collected by WHO and the CDC demonstrate clearly that prevalence and incidence of HIV infection are higher in the young adult populations. This data shows as well that AIDS cases in their late 20s or in their 30s, have contracted HIV 5 or 8 years before - while in university/high school or the army.

In some cultures army life is a catalyst for sexual and drug activities that coincide with sexual development and maturity at that age.

As a totalitarian institution (technology every army is in the position to control HIV infection by obligatory education campaigns in its units. In collaboration with the Israeli Defense Forces Medical Corps, a special educational program for AIDS prevention was developed. It was named "Victory AIDS".

The module is a 100 minutes session which based on direct communication between a medical officer/instructor in an army unit and the soldiers of that unit. Fighting AIDS comes in a kit which includes material for the army doctor: a set of cartoon slides, a leaflet for each army personnel.

Since July 1987 this module, officially accepted as the unified program for the IDF, is implemented in all commands. Special training workshops were developed and conducted for army physicians in the various units.

The module was pre-tested in a sample of units across which were the army fall for women and for men/barriers of implementation will be discussed as well.

T.E.P.15

EFFECTIVENESS OF FEAR APPEALS IN AIDS-EDUCATION POSTERS: COMPARISON BY RACE/ETHNICITY, AGE, AND GENDER IN THREE POPULATIONS

Rhodes, Pam; Weibel, J. and O'Leary, M.
AIDS Research & Education Project, California State University, Long Beach, CA, USA

Objective: To investigate the effectiveness of fear appeals in AIDS-education posters. **Methods:** Twenty experimental posters with high-fear pictures depicting severe consequences of AIDS and 20 posters having pictures that were neutral with respect to disease severity were evaluated in terms of their attention value and their perceived effectiveness in motivating people to use condoms. Poster messages were also manipulated experimentally to achieve high and low levels of communicated personal vulnerability and behavioral response efficacy. Subjects were 310 Black, White, Hispanic, and Asian community residents, college students, and intravenous-drug users (IVDU).

Results: Fear level of experimental posters was positively related to their perceived effectiveness in motivating people to use condoms and to their value in attracting attention ($p < .001$). This effect was consistent across the three populations studied, i.e., general community residents, college students, and IVDU. Response efficacy and personal vulnerability of poster messages, and their interactions with fear, were also significant ($p < .05$) but accounted for relatively little treatment variance in comparison with the fear main effect. Age, gender, ethnicity, and population membership were found to moderate responses to high versus low-fear posters to only a small degree.

Conclusions: Findings confirm previous research supporting the effectiveness of fear appeals in persuasive health communications and suggest that fear-oriented posters may be more effective than positive, non-threatening appeals in motivating a broad range of individuals to adopt AIDS risk-reduction practices.

T.E.P.17

PRODUCTION OF HIV PREVENTION OUTREACH ACTIVITIES TARGETING INTERVENING DRUG USERS IN THE UNITED STATES

Levine, J., Johnson, J., and O'Leary, M.
Centers for Disease Control, Atlanta, GA, U.S.A.

Objective: To implement outreach activities targeting intravenous drug users (IVDU) to control the spread of HIV infection through contaminated injection paraphernalia and sexual transmission to partners.

Methods: IVDU are at greatest risk for HIV infection because of their high risk for HIV infection and their high risk for sexual transmission to partners. This project was an empirical data analysis concerning the effectiveness of outreach activities to IVDU. The project was designed to determine which outreach activities were most effective in motivating IVDU to use condoms and to use clean injection paraphernalia. These programs are currently being implemented by the U.S. Conference of Mayors (Community Demographics project) and the U.S. Conference of Mayors (Community Demographics project) and the U.S. Conference of Mayors (Community Demographics project) and the U.S. Conference of Mayors (Community Demographics project).

Results: The project was designed to determine which outreach activities were most effective in motivating IVDU to use condoms and to use clean injection paraphernalia. These programs are currently being implemented by the U.S. Conference of Mayors (Community Demographics project) and the U.S. Conference of Mayors (Community Demographics project).

Conclusions: Through training and provision of technical assistance, CDC - supported outreach activities targeting IVDU and their partners in community-based organizations - has promoted the implementation of HIV prevention outreach activities targeting IVDU and their partners. The results of CDC efforts have shown an increase in the number of outreach programs targeting IVDU and an increase therefore in the numbers of IVDU receiving HIV prevention education.

T.E.P.14

AN ASSESSMENT OF KNOWLEDGE, PERCEIVED RISK AND BELIEFS ABOUT PREVENTION STRATEGIES AMONG NEW YORK STATE RESIDENTS

Winkler, Caroline M.; Glanville, M.H. and Tolson, J.

Objective: To assess knowledge, attitudes and beliefs about AIDS in the general population of New York State. **Methods:** As part of a CDC-sponsored AIDS prevention project, a random digit telephone survey of New York State adults (N=1117) was conducted between May and September 1988. Survey items were adopted from the 1987 National Survey, from Ostrow (1987) or developed by the authors.

Results: The representative sample included 10% Hispanics and 14% blacks and 86% were divided between males and females, single and married, with a mean age of 43. At least 90% of the sample correctly responded to "basic" questions on AIDS, e.g., major modes of transmission; and over 85% discriminated the possibility of HIV transmission through very casual contact, such as shaking hands. A larger proportion of the sample, however, were still believing that HIV could be transmitted through donating or receiving blood, insects, public toilets and being coughed on. While condom use is correctly regarded by 80% of the sample as an effective risk reduction strategy, more than one-third are uninformed or misinformed about diaphragms and spermicides. Educational attainment, race/ethnicity and age are consistently related to accuracy of knowledge on a number of casual transmission and risk reduction effectiveness items. Knowledge of casual transmission and risk reduction effectiveness items appears to be related to the perceived risk of personal exposure and reported behavior change.

Conclusions: Educational campaigns in New York State must address misinformation about casual contact transmission and provide clear messages about the ineffectiveness of diaphragms and spermicides without condoning sex barriers to HIV.

T.E.P.16

COMPUTER-ASSISTED HIV EDUCATION FOR IVDU

Lewis Benjamin P.M.; Algham D.P.M.; Green A.C.
* Spawton House Inc., Woburn MA 01891, * Trinity College, Hartford, CT 06106, U.S.A.

Objective: To develop and evaluate a modular kit program for IVDU's using computer-aided-instruction (CAI) techniques. Course modules are currently being developed at Trinity College. **Methods:** A Macintosh IIx-based software system developed at Trinity College. TSS facilities development and use of mixed-mode courseware without requiring special computing expertise.

Methods: An experimental bi-lingual CAI program was developed and introduced to a sample of intravenous drug users in an urban clinic. Program modules include 1) a simple instructional module; 2) a module describing HIV, HIV transmission, and IVDU; 3) a module describing protective behaviors (needle cleaning and safe sex). TSS provides quantitative utilization information for evaluation purposes.

Results: A Macintosh computer has been dedicated to this CAI application. Staff have been trained in using the modules. Modules on protective behaviors have been completed, planned and released by 57 IVDU's. As reported in client satisfaction surveys, interest in HIV education employing this technology is substantially higher than in HIV education based on formal compliance.

Conclusions: This interdisciplinary merger of computing technology with HIV education objectives shows great promise. For the first time it is possible to develop multi-media, computer-based instructional approaches which place control of learning in the hands of the learner.

T.E.P.18

MARRIED HOMOSEXUAL AND BISEXUAL MEN - THE DEVELOPMENT OF AIDS EDUCATION STRATEGIES AND RESOURCES FOR HEALTHCARE PROFESSIONALS.

Wolmar, John M., Education and Liaison Officer
Gay and Married Men's Assistance Course, Victoria,
Australia. Curriculum Consultant, Ministry of Education,
Victoria, Australia.

Objective: To present the range of strategies employed and resources developed to assist healthcare professionals and workers to make contact with and educate married homosexual and bisexual men.

Methods: Over one thousand married and bisexual men and their needs, concerns and information levels documented. Specific counselling and education strategies have been developed as a result of this information and has been presented in a number of formats to assist healthcare professionals and workers.

Results: The development of a resource kits entitled - Married Homosexual and Bisexual Men and their Partners; Resource Kit for Healthcare Workers; Workshop Kit for Facilitators; a poster - AIDS Special Information for Married Couples and Bisexual Men; and pamphlets - AIDS Special Information for Married Couples and AIDS Special Information for Bisexual Men. These materials are distributed on request.

Discussion: These materials have trialled and reviewed by Healthcare Professionals. Requests for the materials come from all over Australia including the Australian College of Nursing and District Nursing Society, Queensland. Application of current research assists in the development of relevant resources for specific target groups and their support providers.

T.E.P.19 DIRECT APPROACH WITH INFORMATION TO BLOOD DONORS AT RISK OF AIDS INCREASES THE SAFETY OF THE BLOOD SUPPLY

Van Der Pijl, Ooms*, Reesink, H.P.
*Med Cross Blood Bank, Amsterdam, The Netherlands.

Objective. To study the effects of more direct approach with information to high-risk blood donors, in order to increase the safety of the blood supply. **Methods.** In January 1988 the risk groups of AIDS in the national information leaflet for blood donors, were defined more strictly. Since July 1988 informed consent, indicating non-involvement in high-risk activities, was required. Rates of withdrawal of high-risk blood donors, related to donation history, risk factors and gender were compared, before and after introduction of the new approaches in information.

period	n	donors at risk n (%)	p value before	proportion of repeat donors	p value after
1987	10,498	167 (1.62)		83 (52)	
Introduction new information leaflet					
1988 (Jan./Feb./Mar)	19,663	96 (0.5)	<0.001	54 (56)	
1988 (Apr./May/June)	30	10 (0.2)		11 (37)	
Introduction informed consent					
1988 (Jul./Dec)	27,310	102 (0.4)	<0.001	85 (83)	<0.001

Conclusions. After the new approaches, a significant increase of withdrawal of high-risk donors was observed. The relative proportion of repeat donors being significantly higher after implementation of informed consent.

T.E.P.21

SMOKING, ATTITUDE A PRACTICE RELIÉ DE BÉNÉFICÉ POPULATION COÛTE PEU POUR LE STRAIN AIDS

Van, J.M.M.J., Van der, A., Rade, S., Van, J.
*M.C., *M.C., *M.C., *M.C., *M.C.

Dep. of Community Health Faculty of Medicine, Atila University, Utrecht

OBJECTIVE. Following a large scale program of information dissemination on AIDS, a 50% survey was conducted to assess and compare perceptions and attitude formation of different population groups in the east side town in The Netherlands.

METHOD. The health of various levels in the community, teachers, students, health workers and politicians were randomly selected and interviewed using structured and unstructured questionnaires.

RESULTS. Information on AIDS reached 90-100% of the population studied. Access to information was (low a combination of health, education and responsibility. Attitudes towards collaboration and participation in control programs including voluntary counselling had very high and AIDS was reported in all groups of society. Health workers were the most informed and well advised behavior change. Use of condom was especially indicated in 50-100% of them, and all condom users were students.

CONCLUSIONS. Combined usage of available media is superior than mass media. Teachers are potential agents of behavior change in low health workers. Overall education and community activities in prevention messages should be considered and be reinforced selectively rather than indiscriminate mass education. Behavior change through mass prevention is velocity with health education films, but requires additional efforts to change their way of life.

T.E.P.20

EVALUATION OF THE AIDS EDUCATION PROGRAMME IN S.S.M. PRISONS, AUSTRALIA.

John Doolley, Peter, P. N.S.M. Program of Corrective Services, Sydney, Australia.

Objective. To evaluate the AIDS education programme in S.S.M. prisons which aim to disseminate AIDS information, teach prevention strategies and prepare prisoners and staff for the implementation of HIV positive inmates.

Methods. Inquiries were conducted with random samples of prisoners from six S.S.M. prisons. Their knowledge about AIDS, attitudes to AIDS and risk of sexual behavior were assessed using standardized semi-structured interviews. The interviews with prisoners of each S.S.M. prison were also assessed from questionnaire data and from interviews with staff members of each S.S.M. prison. Overall prisoners and staff levels of knowledge about AIDS were low, but educated prisoners had a significantly higher level of knowledge about AIDS. New prisoners were optimistic that the spread of AIDS could be stopped in S.S.M. prisons then staff. Variety of arguments for and against prison AIDS prevention strategies (compulsory testing, segregation or integration of HIV positive inmates in prisons and close medical care) were put forward by both staff and prisoners. Sex prisoners said they had abandoned drug use or sexual relationships or had adopted their partners to reduce the risk of spreading AIDS. However, other prisoners said they continued to engage in behavior that they knew would put them at risk for AIDS.

Conclusion. AIDS education must involve staff and prisoners and staff to continue their knowledge about AIDS. To address this AIDS education must involve staff and prisoners and staff to continue their knowledge about AIDS. To address this AIDS education must involve staff and prisoners and staff to continue their knowledge about AIDS. To address this AIDS education must involve staff and prisoners and staff to continue their knowledge about AIDS.

T.E.P.22

CIS-AIDS ZAGREB: TELEPHONE ENQUIRY SERVICE - TWO YEARS' EXPERIENCE

Gotovac Petar, Lang S., Svjetlicina M., Stritar M., Baklaic T., WOODGATE M.

*Zagreb Institute of Public Health, Zagreb, Yugoslavia
*City Committee for Health and Welfare, Zagreb, Yugoslavia

Objective. Yugoslavia belongs to a group of countries with the lowest cumulative number of AIDS cases (65 AIDS cases as of 23rd Dec. 1988). The AIDS help-line in Zagreb was established with the aim of enabling the general population and health workers to receive information and advice on AIDS or on equal basis. Apart from the telephone line educational activities are also conducted within the CIS-AIDS (Center for Information and Education on AIDS).

Methods. The Center has developed horizontal and vertical communication with related institutions and offers a comprehensive and updated knowledge about AIDS. Public health workers daily answer telephone calls in scheduled time.

Results. Initial frequency of calls, in 1987, was between 50 and 100 per day, gradually decreasing to less than 10 calls/day. An estimated 10% of calls are placed by persons belonging to any of the risk-behaviour groups or otherwise potentially exposed to HIV infection.

Conclusion. Through adequate information and advice HIV infection IS REDUCING the stigmatization of social stigma. The activity of CIS-AIDS represents a new form of health promotion in Zagreb.

T.E.P.24

ESSAI D'UN DIDACTICIEL EN PREVENTION DU SIDA/MTS ADRESSE A'ADOLESCENTS.

Claudet, Richard, Département de santé communautaire, Hôpital général de Montréal, Québec, Canada.

Objectif. Développer un logiciel éducatif interactif en prévention du SIDA et des MTS et l'évaluer dans une école secondaire d'élèves de 15 à 17 ans.

Méthodes. Un logiciel éducatif "Les MTS, c'est facile à éviter", a été conçu et mis à l'essai auprès de 200 élèves de 15e et 16e années. Le programme est composé d'un questionnaire appelé BÉNÉFICÉ portant sur les connaissances et les attitudes face aux MTS et au SIDA et évalue le risque de contracter une MTS. Des informations sous forme de jeux et d'animations sont offertes sur le SIDA, la gonorrhée, la chlamydia et les moyens de se protéger. La gestion informatisée des apprentissages est possible et permet à un intervenant de coder des activités pédagogiques de groupe.

Résultats. Avec un questionnaire de type stratifié il a été démontré que les élèves connaissent le logiciel très viable (4,0/5), très intéressant (4,7/5), très utile (4,5/5) et amusant (4,1/5) et savent parler (4,2/5). On voit aussi que les dix-neuf actifs socialement appréciés davantage le logiciel que ceux qui ne le sont pas. Les commentaires recueillis soulignent l'intérêt pour la facilité d'utilisation, l'aspect interactif du logiciel, l'individualisation de l'enseignement et le respect de l'acceptation.

Conclusion. La détermination d'une note personnelle du risque de contracter une MTS et la possibilité d'analyser les données des élèves ayant utilisé le programme sont des aspects particulièrement intéressants. Ce logiciel est un outil novateur et utile pour la réalisation d'activités éducatives sur le SIDA et les MTS auprès des adolescents.

T.E.P.25 LIVE BEYOND YOUR LIMITS Nasaney, Louis* Kolb, Glenn* *Louis L. Hay Educational Institute Santa Monica, Ca., U.S.A.

Objective: To describe how Louis Nasaney has combined medical, holistic, and nutritional techniques to survive AIDS for over six years.

Methods: In addition to medical therapies which have included AZT and Interferon, Mr. Nasaney has also employed alternative techniques such as vitamins, nutrition, meditation, visualization, positive affirmation, and self-love to survive during this time.

Results: Mr. Nasaney has not been ill during this period due to an HIV-related cause. The quality of life has vastly improved since diagnosis.

Conclusion: Medical and alternative techniques combined with loving the self have affected well-being and survival.

T.E.P.27 WHO IS AFFECTED BY AIDS TREATED AS OUTSIDERS; CONSEQUENCE OF MISINFORMATION. Coronado, A., Conde, F., Arredondo, C. S., Gil, E.* Ministry of Health

Objective: The strategy of information based on the relationship of AIDS-death, the diffusion of the concept of groups at risk... has led to the creation of a stereotype of AIDS whose extremely negative social consequences lead to social segregation of the collective social groups susceptible to becoming affected, and to the nihilism and fatalism of those who suffer it.

Conclusion: It is absolutely necessary to change this one way communication code that encourages uncertainty and fear. For a double communication code that simultaneously defines the healthy stages of the syndrome on one hand, and on the other hand the individual and collective behaviour that the individual carrier as well as the non-carrier should adopt at each stage of the illness.

T.E.P.29 THE MALE COUPLE: A CASE STUDY Krusch, Judy Social Work Department, St. Paul's Hospital Vancouver, British Columbia, Canada

Reliable social science research indicates that over 50% of gay men maintain committed, intimate relationships for one to five years. Other studies and clinical reports document relationships between gay male partners lasting from five through fifty years. What is surprising is the number of male couple relationships that manage to survive and endure in the face of institutionalized, social, and internalized homophobia. Gay male relationships lack legal and religious sanctions and are often unsupported by the partners' families.

This presentation will discuss the impact of a diagnosis of HIV infection/AIDS on one male couple and the stresses this created on their relationship. Some of these stresses included: addiction to prescription drugs, disclosure of the illness to others, resurgence of internalized homophobia, concerns with sexual and physical intimacy, depression, financial problems, dementia and a suicide attempt.

Conflict between the couple and the PWA's mother accelerated. Excerpts from an audio tape sent by the PWA's mother graphically depicted her anger, hostility, and homophobia towards her dying son and his lover.

This case study illustrated the multi-dimensional challenges endured by the couple, and how they managed to maintain their relationship when faced with a diagnosis of AIDS.

T.E.P.28 EVALUATION OF THE ITALIAN NATIONAL AIDS INFORMATION CAMPAIGN.

Mazana Giannini, Rosvati V., Greco U., Pisanello M., Zamagni A., Istituto Superiore di Sanità, Rome, Italy, Aversa, Milano, Italy, A. Tesse, Roma, Italy.

Objective: To determine knowledge and beliefs about HIV transmission and prevention; to determine the impact of the national AIDS information campaign.

Methods: A random sample of the general population of Italy was selected using a multistage sampling procedure. The sample was selected in order to be proportional to the general population for sex, age groups, population size, and geographical area. The sampling unit was the local authority and within each of its subjects were randomly selected from telephone directories. Interviews were carried out by phone in the evening, using a structured questionnaire. The key questions were about transmission, prevention, risk categories and information. The interviews were carried-out in 3 stages, early in July 1983 before the starting of the campaign and in October just before the ending.

Results: 2,363 numbers were selected in stage I, interviewed in 1,050 and refusal in 42.3. The figures for stage II were respectively 2,251 contacts, 1,012 interviews (66.4% of attempts) and 44.0% response rate. 37% of the subjects in July and 37.8% in October knew at least the word AIDS. However in October 71% considered AIDS a disease extremely contagious, compared to 57% in July; 60% knew about the sexual transmission of HIV in October and 57% in July. Comparable figures for parenteral transmission were 75% and 37%. A more detailed analysis will be presented at the Conference.

Conclusions: Although the low response rate limits the value of the results it seems that in Italy there is a good general knowledge about AIDS even though more efforts should be made in the area of actual prevention of the spread of the disease.

T.E.P.28 NEEDS OF FAMILY CAREGIVERS OF PERSONS WITH AIDS Cohen, Nancy H. and Wilson, G. Long Beach Health Dept., Long Beach, CA, USA

Objective: To determine the social and educational needs of family members of adult male persons with AIDS (PWAs).

Method: A detailed assessment questionnaire was designed, pre-tested, and administered to 50 family members. In addition, a focus group of bereaved family members was conducted to identify needs associated with terminal stages of AIDS.

Results: Specific needs of the family were related to duration and severity of the PWA's condition. Early in the course of the disease, families wanted information on AIDS transmission and prevention, their own risk, treatments, who to call, and nonsexual depression (theirs and their PWA's), and care resources and skills. Some bereaved caregivers wanted more concrete information about legal issues, preparing for death, funerals, management of religious issues and conflicts, emotional changes to expect, survivor guilt, managing grief, and determining how much information to disclose to whom. After death, a major concern of a significant portion of families was how to most effectively fight AIDS; others wished to retreat from involvement in AIDS. Need for family and social support occurred throughout the process.

Conclusions: In order to most effectively serve their needs, programs targeting family caregivers should be tailored to the stage of HIV infection at which their relative with AIDS curvey from home.

T.E.P.30 AIDS PREVENTION AS COMMUNITY INTERVENTION Urevis, V., Jewell, T., Sennerfeldt, P. and Ohgren, M. The Stockholm Youth Prevention Project, Stockholm, Sweden

Background: Behavioral change requires not only information but also a social environment. This project was designed to address this need through discussion with trusted peers and adults. Stockholm county has around 250,000 teenagers.

Objectives: To make adults who meet teenagers in their everyday life as professionals, privately or as volunteers prepared to discuss and give information on sex and relationships, STD and AIDS.

Method: Through using the existing infrastructure, massive outreach was possible in short time. Partnerships were formed with local authorities and organizations. The project offered training, service, support and follow up. During 2 years 3,500 people were trained: teachers, schoolnurses, youth leaders, priests, social workers, PTA-members etc.

Results: 98% of all schools for 13-20 year olds have sex-education including info on STD and AIDS. Numerous youth clubs have developed discussiongroups on sex and relationships. New youth clinics are established. Local plans are being developed.

Le SIDA, la société et le comportement AIDS, Society and Behaviour

T.E.P.31 The hiv-epidemic: Attitudes towards public preventive measures in the Norwegian population. **Stein A. P. Kraft**, National Institute of Public Health, Oslo

Several public preventive measures have been debated in Norway in order to combat the hiv-epidemic. Coercion against the so-called risk-groups and hiv-infected persons, different hiv-antibody testing designs, revelation of the identity of hiv-infected persons, and regulation of sexual behavior. Eleven statements were constructed in order to test the attitude structure of these issues in a nationwide interview survey in March 1988 in 1100 Norwegians aged 15 and above. A factor analysis produced three attitudinal dimensions which may be denoted: "Prohibition", "Coercion", and "Restriction". The "Prohibition" dimension was strongest and explained 24.6% of the variance. The "Restriction" dimension explained 20.8% of the variance. The "Coercion" dimension explained 15.7% of the variance. The results indicate that in addition to being associated with factors related to hiv-aids and psychological factors, attitudes towards public preventive hiv-measures is a controversial issue impinging upon the value-attitudinal axis as empirically observed in Norwegian politics.

Political issues Social Policy

T.E.P.33 COMMUNITY PARTICIPATION IN THE DEVELOPMENT OF A FIVE YEAR PLAN ON AIDS/STV. **YORK STATE'S PROCESS AND SIGNIFICANT FINDINGS** **Arnella D'Angelo, Terrence C. McP.H., *AIDS Institute, New York State Department of Health, New York, U.S.A.**

Objective: To describe the process that allowed New York State to incorporate community analysis of AIDS related problems in the Governor's Five Year Plan on AIDS and to summarize significant recommendations.

Method: A series of nine Roundtable discussions were held with health and human service providers, advocacy groups, community based organizations, and persons with HIV infection. Roundtables were charged with identifying AIDS related issues, prioritizing those issues and then developing recommendations. **Results:** A total of eighty recommendations emerged from the Roundtable process. A significant outcome was that separate Roundtables often developed similar recommendations, thereby strengthening these proposals. Included among these common recommendations were: increase access to a wider variety of ongoing training to professionals so they may be sensitive to the needs of different populations; provide services to families; develop and refine educational materials with the targeted community's assistance; increase access to information and clinical trials and identify sources of alternate sites of care.

Conclusion: The Roundtable discussions were a useful means of identifying important issues and proposing specific recommendations. State agency planners gained valuable insight into "Frontline" needs, and community representatives expressed satisfaction with the dialogue that was established.

T.E.P.35 A FEMINIST VIEW OF AIDS: POLICY IMPLICATIONS OF THE SOCIAL CONSTRUCTION OF A DISEASE

Richard R. Ralston, MD, Working Group on Women and AIDS and the Bruce V. Glavin Hospital, Baltimore, MD, USA

Many policy decisions affecting HIV positive women in the US are informed by implicit principles and covert perceptions which obtain to women. In general, differences from men, but may not be consciously available to policy makers. These differences result in prevention principles with limited likelihood of success: i.e. approaches which mirror previously unsuccessful campaigns like our current efforts to decrease the rate of teen pregnancy. These policies may have widespread implications for gender definition, sexual autonomy and reproductive choice among women at risk for infection as well as women, who because of class and race categories frequently used as proxy for risk in the absence of known behavior, disproportionately experience their impact. North American feminist analysis provides a framework to understand these underlying principles and evaluate their policy implications. Feminist experience utilizes concepts like empowerment may provide new directions in policy and prevention.

T.E.P.32 AIDS in Barbados

Prof. E. B. Walton, Chairman, National Advisory Committee on AIDS Barbados

Barbados is a small independent island country in the Southern Caribbean with a population of 250,000. The population is well educated and has good internal and external communications. The island has 400,000 tourist visitors a year, and this is one of the mainstays of its economy.

The first indigenous case of AIDS was reported in late 1984, and the local medical association and the Ministry of Health moved early in 1985 to establish general and health professionals' education and the screening of donated blood. The epidemic has been similar in pattern to that in the West with well and predominantly male homosexuals affected at first, with increasing heterosexual transmission thereafter. The prevalence of the disease is similar to that of the United States.

Aspects of the education programme to send simple direct messages without an extraordinary message of death are described. Evidence is presented that the messages are being reabsorbed, they may have however had high risk individuals to use the blood donation service to obtain testing free and without counselling. The limited evidence obtained is used to direct specific changes in education and practice related to AIDS education, prevention and control.

T.E.P.34 PATIENTS' PREFERENCES FOR LOCUS OF CARE AND FOR ACTIVE TREATMENT: PRELIMINARY RESULTS OF A SURVEILLANCE STUDY

Mrs. Virginia Fleishman, J. Piette, J.*

*Brown University, Providence, Rhode Island, USA.

Objective: To describe preferences of people with AIDS for care at home and for continuing active treatment in the face of severe symptoms.

Methods: Personal interviews were conducted with 257 clients of the Robert Wood Johnson Foundation's AIDS Health Services Program in 9 cities in the US. We assessed patients' preferences for home treatment (e.g., dying at home, being treated at home, being home with unreliable medical care access) and for active treatment in the face of severe symptoms (e.g., constant nausea, incontinence, disfigurement, life support dependence). We compared responses by risk group and by whether the patient had recently been hospitalized. **Results:** Nearly 90% want to die at home; 73% prefer living at home even if city to living in group quarters; and 61% prefer being home even if access to medical care is more complicated than getting therapy in a hospital. Patients' willingness to endure complications of aggressive treatment had 3 clusters: common symptoms, which 55-57% would tolerate; functional dependence and disfigurement, which 31-41% would take; and life support risk group, which only 8-11% would put up with. Only small differences by risk group were observed, and recent hospitalization was unrelated to preferences.

Conclusion: Patients' preferences for home-based care are consistent with social norms and should be considered in program planning. Preference for aggressive treatment varies as a function of the anticipated consequences.

T.E.P.36 The Social Correlates of AIDS Heterozygosity, **Onasme for Onasme**, **Parrell, J.**

*New York University, New York City, NY, USA

Objective: To explore the social correlates of AIDS heterozygosity (negative attitudes toward persons with AIDS) among Americans and to investigate the implications it has for the rights of persons with AIDS and policies directed at persons with AIDS.

Method: Data from the General Social Survey were examined using multiple regression analysis in an effort to determine what were the social correlates of the implications it has for the rights of persons with AIDS and policies directed at persons with AIDS. **Results:** AIDS heterozygosity was not easily explained by the variables traditionally used in social science research. Among the strongest indicators was the overall level of education, but this too was weakened when personal contact issues, such as whether or not AIDS testing should occur before marriage, were introduced.

Conclusion: This investigation has implications for policy makers because it demonstrates that general research, such as programs to reach the most people such as mass mailings or television shows) may not be the best method to do it. It does mean that programs must be designed to address issues that are of concern to the public, but that program designers and policy makers are well advised to study just what they mean by "public."

T.E.P.43 Current Utilization of Inpatient Alcohol and Drug Treatment Services in a Cohort of IV Drug Users.
Edelman, Lisa; Frank, R.; Vibash, D.; Colestanto, D.; Cohen, S.
The ALIVE Study. The Johns Hopkins University, Baltimore, MD, USA.

Objective: To determine the current utilization of inpatient drug and alcohol treatment services in a cohort of high risk IV drug users (IVDU) and to correlate current utilization with serostatus.
Methods: A cohort of IVDU, recruited by community outreach, were enrolled in a longitudinal study of HIV infection. Participants were queried concerning their utilization of inpatient drug or alcohol treatment services within the prior six months. Utilization of services was correlated with HIV serostatus.

Results: Among the group of 305 respondents, 23% were HIV seropositive (ELISA and WB confirmed). Twenty-four (18%) had been an inpatient in a drug or alcohol detoxification program within the previous six months. Four (9%) of those in drug or alcohol treatment, versus 50 (23%) not in treatment were seropositive (p < .001).

Conclusion: Although based on a self-selected cohort, these data indicate that the majority of patients in inpatient detoxification are also on limited broadcast community testing programs need extensive resources in order to reach, inform, and motivate populations at risk for HIV infection. Creative strategies are needed in order to maximize limited resources, overcome cultural barriers to research in general, and to deal with the anxieties that people have about HIV testing and research.

T.E.P.44 THE SOFT UNDERBELLY OF RESEARCH: ADMINISTRATIVE AND COST CHALLENGES IN A STUDY OF HETEROSEXUAL HIV TRANSMISSION

Lauter, D.; Kierler, S.; Peisngold, L.; and Mayer, Kenneth.
New England Behavioral Health Study (NEHS), Brown University, Providence and Memorial Hospital, Pawtucket, RI, U.S.A.

Objective: To enroll up to 3000 heterosexual adult volunteers in a cross-sectional seroprevalence study of HIV transmission, and up to 1000 high risk heterosexuals in a prospective cohort study.
Methods: Recruitment, beginning in early 1988, has involved establishing multiple outreach and referral sites at hospital-based HIV clinics, community service agencies, drug and STD treatment facilities, and other agencies serving HIV high risk populations. Publicity efforts have included public service announcements for TV and radio, newspaper ads, brochures, booklets and newsletters. Participants are offered free physicals, counseling, HIV testing which includes risk surveys and "Partner" lymphocyte screening for HIV, persons, and medical and social service referrals, but are not paid.

Results: In the first 16 months, 215 people (109 women and 106 men) have enrolled. In the first 16 months, 215 people (109 women and 106 men) have enrolled. In the first 16 months, 215 people (109 women and 106 men) have enrolled. In the first 16 months, 215 people (109 women and 106 men) have enrolled.

Conclusion: Research and voluntary testing initiatives. Creative strategies are needed in order to maximize limited resources, overcome cultural barriers to research in general, and to deal with the anxieties that people have about HIV testing and research.

T.E.P.45 NEW JERSEY'S SEXUAL BEHAVIOR REASSESSMENT PROGRAM - EVALUATION OF ITS IMPACT ON SEROLOGY RISK

Chandler, R.; Wang, S.; Hamel, J.; Hothorn, B.; Costa, S.
New Jersey State Department of Health, Trenton, New Jersey, USA

Objective: New Jersey received \$5.5 million and subsequently \$996,000 from Congress to provide additional funds for low-income people with HIV infection lacking public assistance, enough to provide for about 175 persons years of AZT (Zalcovir). This study's objective is to determine the characteristics of persons receiving the drug through this program, to compare them with persons receiving the drug through other programs and to determine the effect of AZT on length of life of recipients.

Methods: Confidential serologic data from the serologic program was compared to information from the State AIDS Registry. Demographic and diagnostic variables were matched between two samples: those receiving the drug through the various serologic programs and those on the Registry who were not receiving the drug. In the basis of the Registry, length of life was studied. 504 persons receiving AZT through serologic programs was compared to 3153 persons on the State AIDS Registry.

Conclusions: The demographic profile of the two sample groups were fairly well-matched. However, analysis identified a need for further outreach to black men, who are under-represented in the AZT population as compared to the State AIDS Registry. This study also provides an analysis from a broad public policy perspective that compares existing national literature.

Results: Analysis suggests an effect of AZT on persons on the various serologic programs in terms of increased length of life, when compared to survival time of a comparable sample of individuals from the State AIDS Registry. 73% of AZT recipients were alive at the end of the study period, compared to 50% from the State AIDS Registry sample not receiving AZT through these programs.

T.E.P.46 POLITIQUE D'INFORMATION MUNICIPALE DE LA VILLE DE MONTRÉAL RELATIVE À LA PREVENTION DE LA SIDA

CHATELAIN, J.-M.; DORE, J.-M.; BEAUN, Raymond; GAGNON, de Montréal, Québec, Canada

Objectif: Prévenir la politique municipale de la Ville de Montréal relative à la prévention de la SIDA.

Contexte: La Ville de Montréal a décidé d'intervenir à l'indicateur des quatre rôles qui lui sont dévolus en ses qualités d'employeur, d'entrepreneur de services, de gouvernement municipal et d'agent de planification sociale: 1) traiter la progression de l'épidémie; 2) réduire les conséquences sociales négatives aux personnes atteintes; 3) favoriser l'implémentation des ressources susceptibles de répondre aux besoins exprimés par la maladie.

La Ville l'adoption d'une politique qui identifie clairement les intentions de la Ville par rapport à ces quatre rôles, la Ville entend mettre en oeuvre les six mesures concrètes suivantes:

- 1- planification et diffusion d'un programme d'information pour ses employés;
- 2- planification et diffusion de programmes de formation adaptés à l'usage des employés de première ligne afin qu'ils puissent effectuer leur travail de façon sécuritaire et respectueuse des droits de la clientèle atteinte;
- 3- mettre à la disposition de la population la documentation relative au SIDA et à sa prévention;
- 4- effectuer obligation dans certains établissements publics de mesure de prévention contre le SIDA;
- 5- l'élimination des obstacles à l'établissement des ressources aptes à répondre aux besoins exprimés issues du SIDA;
- 6- la participation à la concertation des différentes actions entreprises sur le territoire de la Ville en vue de contrôler le SIDA.

T.E.P.47 RECENT CHANGES IN SEXUAL BEHAVIOR AMONG MEN IN LOS ANGELES
Frasser, R.; Lewis, C.; Bannenberg, K.; Corey, C.
University of California at Los Angeles, Los Angeles, California, U.S.A.

Objectives: To assess the changes in sexual behavior among homosexual and heterosexual men over a 2-year period.

Methods: Random-digit dialing telephone calls were placed to residences; men ages 18-60 were eligible to be interviewed. Households in census tracts with higher than average rates of reported cases of AIDS were oversampled. Results are weighted to reflect oversampling.

Information on sexual orientation, numbers of sexual partners, and other risk-related behaviors, were gathered for 2 time frames: the past 2 years and the past 3 months.

Results: Significant differences are found between homosexual and heterosexual men in terms of numbers of partners and presence of other risk-related behaviors (over half the homosexual men in the study reported having 4 or more sexual partners in the past 2 years (1986-1988), as compared with less than one quarter of heterosexual men).

Sexual activity and increased rates of reported cases of AIDS were documented for both groups over the past 3 months (March-June 1988), although a higher percentage of homosexual men remained highly sexually active.

T.E.P.48 SCIENCE AS A POLITICAL FORCE: THE CASE OF THE AIDS EPIDEMIC

Smith, Stephen C., Human Rights Campaign Fund, Washington, D.C., USA

Objectives: To draw the lessons of the AIDS crisis for the role of science and scientists in political life.

Methods: The author - who has divided political arguments and strategies for AIDS politics according to scientific advice - will review relevant literature in the history of science.

Results: Most modern political-economic systems claim to be "scientific," and science has greatly reduced the forces that most excite human fears - poverty, violence, and disease - but public understanding of science has not progressed at the same rate.

Scientists are not well represented among policymakers nor in the general public. Thus, the average person, even in "developed" countries today, often responds to their basic fears from superstition or pseudoscience, not scientific thinking.

The public and political responses to the AIDS crisis demonstrates the results: many people are reluctant or unwilling to accept the advice of science on scientific questions - e.g., modes of transmission. Policies may thus be based on an unscientific response to fear, and may be counterproductive.

Not only in addressing the problem at hand, but in developing a scientific outlook on the common challenges of human society. Conclusion: Scientists must become more actively involved in political life and the formulation of policy.

T.E.P.49 THE REFERENCE AND TRAINING CENTER ON AIDS, S&O PAULO, BRAZIL.

Keywords: M. E. L. L.; Teixeira P.R., Dal Bianco, Rosana, Pinto V., Ueda H.

Referencia e Treinamento em Aids, São Paulo, Brazil.

Objective: In February 1985 the secretariat of Health, of S&O Paulo, Brazil created a reference and Training Center in an 8 floor building to bring together the state Aids Prevention and Control Plans. The Center is composed of: The surveillance UNIT, the educational and Training UNIT, a day care hospital, an out patient clinic, a laboratory UNIT, a "central for hospitals beds vacancy and a multiprofessional home care unit.

Methods: A multiprofessional TEAM with experience on Aids since 1983 established the policy of Aids Prevention and Control in the state of São Paulo, and disseminated the information on Surveillance, Education, Patient care to the 63 health regions. Coq culture is being done to all 63 health regions.

Results: 3,000 patients are followed in average/per month in the out patient clinic.

- HIV patients from all state are being followed in 75 different health care units after training.

- 210 health care providers and community leaders were trained in 1985.

Conclusion: the reference and Training Unit Permitted the implementation of the policy Aids Prevention and Control in the State of São Paulo.

T.E.P.50 A STUDY OF NATIONAL AIDS/RIV POLICIES AND PROGRAMMES IN THE 31 COUNTRIES FOR THE EUROPEAN REGION

Keywords: Brigitte, and Weyling, E.*
*World Health Organization, Regional Programme on AIDS, Copenhagen, Denmark

Objective: To describe and evaluate national AIDS/RIV policies and programmes in the European Region and identify strategic lessons for national AIDS/RIV prevention, control and care policies.

Methods: An analytical review, using guidelines of good practice developed by the Global Programme on AIDS, of material from representatives of national governments. Preliminary results substantiated through formal and informal contacts with persons in and outside of government.

Results: National AIDS Committees and other national coordinating mechanisms that are multi-disciplinary and include participation of Non-governmental Organizations initiate AIDS/RIV policies that appear to achieve a greater degree of effectiveness in HIV prevention and securing a continuum of care.

Conclusion: The presence or absence of explicit policy is not necessarily the measure of the effectiveness national AIDS/RIV programmes. Effective policy programmes appear to be strongly influenced by the mechanism by which they are formulated and implemented. As such, and lacking comprehensive measures of HIV seroprevalence, the policy process and application in practice must be evaluated to estimate impact.

T.E.P.51 PROVISION ACCESS TO PROMISING INVESTIGATIONAL DRUGS (I.D.) A MANAGEMENT MODEL FOR "TREATMENT IND"*

Keywords: Feinberg J.; Myers, M.; Oubisi, E.; Roth, D.; AIDS Program, National Institute of Allergy and Infectious Diseases (NIAD), Bethesda, Maryland, USA

One of the primary goals of the AIDS Program, NIAD, is the rapid transfer of new therapeutic advances from the clinical research setting to the community of treating physicians. New federal regulations (42CFR) defined a mechanism for access by any licensed U.S. physician to promising investigational new drugs (IND) that have evidence of safety and preliminary evidence of efficacy in serious of and life-threatening diseases. These "treatment IND" protocols provide access by any licensed U.S. physician to such therapies.

We have employed "treatment INDs" as part of our overall strategy for rational drug development, and have created a successful management model for their design and implementation. The key components of this model, to be discussed in detail, are: (1) establishment of a telephone information capability (hotline), (2) protocol design, (3) physician education, (4) triage and enrollment process, (5) drug distribution system, (6) data capture and retrieval, and (7) analysis of results.

The AIDS Program has sponsored the only 8 such "treatment INDs" for AIDS indications. While each novel therapy for AIDS patients presents unique medical and logistical problems, we have successfully developed a strategy for "treatment INDs" which allow access to new agents and collect data on their use while meeting U.S. regulatory requirements.

T.E.P.52 DISCRIMINATION AGAINST HIV POSITIVE WOMEN BY ABORTION

Keywords: AIDS Discrimination Division, New York, N.Y. City Commission on Human Rights

Objective: To document discrimination against HIV positive women in access to abortions in New York City.

Methods: Test calls were placed to 39 abortion clinics. After an appointment was made for an abortion, the caller revealed that she was HIV positive.

Results: Of 25 clinics surveyed, 16 (64%) would not schedule an abortion for a woman who reveals she is HIV positive.

Conclusion: Many health care professionals who perform abortions in New York City manifest open hostility toward HIV positive female patients and remain poorly educated on the need to use universal infection control precautions, thereby violating various public health and anti-discrimination laws.

T.E.P.53 PSYCHOSOCIAL ADAPTATION AND ECONOMIC CIRCUMSTANCES OF PERSONS WITH AIDS OR ARC

Keywords: Heston, Margaret
Rutgers University, New Brunswick, NJ, USA
*School of Medicine, University of California, San Diego, CA, USA

Objective: To evaluate how persons with AIDS (PWA) and persons with ARC (PWARC) meet their economic needs.

Methods: 50 PWA and 54 PWARC were surveyed in San Diego County, California, between October 1984 and February 1987.

Results: Social and economic impacts of the disease had been profound for both groups. PWARC reported more urgent needs than did PWA. Both groups reported their greatest unmet needs as financial. A majority were no longer employed; 64% of unemployed PWA but only 41% of unemployed PWARC were receiving Social Security disability or SSI, and many unemployed PWARC had little or no income. Most PWARC lacked Medicaid or other health insurance coverage.

Conclusion: Health care and social services systems will be increasingly challenged not only by needs of PWA but by severe unmet economic and medical needs of an even larger population of PWARC.

The Role of Non-Governmental Organizations**

T.E.P.54 CANADIAN HEMOPHILIA SOCIETY: A PLANNED RESPONSE TO HIV AND AIDS

Keywords: Robert O'Malley, Nana Nera, M.Sc.S.W., C.S.W., Canadian Hemophilia Society, Social Services Advisor, Federal Centre for AIDS, Health and Welfare Canada, Ottawa, Canada

This presentation will describe how a consultative planning process model used by the Canadian Hemophilia Society (CHS) to deal with HIV and AIDS has resulted in an effective response to the crisis.

CHS created a "Task Force on HIV and AIDS" in 1987, comprising of a non-medical and medical group. The four-step planning process followed by these two groups to develop a comprehensive response to the HIV/AIDS catastrophe will be presented and discussed.

The numerous positive effects and substantial results of this well coordinated planning process will be shared at this conference.

Session d'affichage Poster Session

T.E.P.55

CANADIAN HEMOPHILIA SOCIETY: A NON-GOVERNMENTAL MODEL APPROACH WITH A COLLABORATIVE ORGANIZATION (190)

Mrs. Norma M. Sawyer, R. J. Federal Centre for AIDS, Health and Welfare Canada, Ottawa, ON, Canada

The devastating impact on HIV/AIDS did not make its mark early on to the Canadian Hemophilia Society as an organization. In early 1980, shortly after the Minister of Health and Welfare, Canada, announced its five-year national program, the then National AIDS Centre met with the Canadian Hemophilia Society to analyze the impact of HIV/AIDS on the hemophilia community. The effects of blood products, HIV testing and psycho-social needs of hemophiliacs with hemophilia became of paramount concern.

With the assistance of the Federal Centre for AIDS in July, 1987 both the Canadian Hemophilia Society and the Federal Centre for AIDS used various approaches to meet identified needs of the hemophilia community.

This presentation will not only describe the step-by-step process which led to this collaboration with a non-governmental organization, but will also present the achievements derived from such a partnership. The benefits derived by the Society as an organization; the community members as individuals, families and support groups, as well as the general community; and the benefits derived by a governmental agency in the response to the AIDS crisis will be described.

T.E.P.56

ROLE OF THE UNIVERSITY: EDUCATION, RESEARCH, POLICY AND SERVICE

Bethel Cayton, Cooksey, J.A.*

*University of Illinois at Chicago, Chicago, Illinois, U.S.A.

Objectives: To describe a role for an urban university in AIDS education, research, policy and service.
Methods: The University of Illinois at Chicago appointed an AIDS Advisory Council in 1987 with the charge: encourage AIDS-related instruction and prevention programs; promote research; advise on policy; and develop community outreach. Faculty, students, employees and administrative members developed an organizational plan: identified priorities and carried out the charge through several working groups.

Results/Education: - highest priority; distribution of printed AIDS awareness materials; peer education program for students. Research - information and interest sharing; quarterly research forums combine biologic and social scientists; newsletter listing all AIDS grant programs. Policy - campus level policy; addressing nondiscrimination, no mandatory testing, educational progress; and currency with legislation and scientific guidelines. Service - community outreach and empowerment; forum on AIDS prevention and resources in community groups in the neighboring area.
Conclusions: A university has many technical, leadership and service resources to utilize in developing an institutional response to the AIDS epidemic. These resources may be productively shared with the community.

T.E.P.57

PRIMARY CARE AT A RESIDENCE FOR PERSONS WITH AIDS (PWAA) BALLEE HOUSE, NEW YORK CITY, U.S.A.

Ramon A. Torres, Staats '88*

*St. Vincent's Hospital and Health Center, New York, NY, USA.

*Ballee House (BH), New York, NY, USA.

Objective: To describe a pilot program of onsite primary care at Ballee House (BH), a 14 room residence for persons with AIDS in NYC. The program includes assessment, advocacy, and timely referrals to lead to appropriate interventions.

Methods: A 6 month pilot program was instituted at Ballee House in 7/88 to provide onsite medical consultation to supplement the existing team of nurse practitioners, social workers, substance abuse counselor, and personal care workers. Close association with a local community hospital, SVHC, facilitated referrals for diagnostic procedures, hospitalization and/or specialty clinics.

Results: During the six month period 137 resident contacts by the medical/nursing team led to referrals for outpatient therapy for opportunistic infections, including oral candidiasis, PCP, bronchitis/pneumonia, and soft tissue infections. Many were seen in the SVHC clinic of the BH medical consultant. Familiarity with the physician appeared to encourage compliance with clinic visits and treatment plan. Other referrals were to emergency rooms, psychiatric clinic, specialty clinic, private labs, etc. for transfusions, diagnostic tests, direct admission, or experimental protocols. Inclusion of a physician in the BH team also allowed for administration of intravenous hydration and infusion therapies in conjunction with and supervised by the Visiting Nurse Service of New York, administration of aerosol Pentamidine, laboratory monitoring, supportive care to terminally ill patients, counseling, and crisis intervention.

Conclusions: Onsite primary care in a residential setting, utilizing the team approach, provides for more comprehensive outpatient management of PWAs.

T.E.P.58

AIDS OUTLET FOR EDUCATION (AOE): A BROAD-BASED ORGANIZATION FOR THE COORDINATION OF AIDS EDUCATION, RESEARCH AND PREVENTION SERVICES

Billy, Bruce J.; Ballouck, D.P.; Peterson, J.M.*

*American Disease Control Center, Colorado, U.S.A.

Objective: To coordinate and extend the duplication of efforts by agencies in the state of Colorado involved in AIDS education, information and prevention.

Methods: Beginning in July 1988 with 6 members, AOE had grown to 42 members by December 1988. Members include individuals and organizations, public and private, involved or concerned with AIDS educational activities. They include state and local health departments, community-based service organizations, hospitals, insurance carriers, state and local school districts, blood banks, minority organizations, and family planning groups.

Results: AOE collectively sponsors educational events and maintains a coordinated schedule of home care fairs. In July, 1988, AOE incorporated as a nonprofit educational organization.

Methods: Members meet once a month to share resources and present work completed and planned. AOE has a 13-member working Board of Directors. AOE has coordinated three annual statewide education campaigns. In 1987, AOE received national recognition for its first media fair for the show "DAYS OF THE FIGHT". The coordinated program has been documented for 20th anniversary to a cumulative audience of 100,000 people from October 1988 to November 1989. The data base collects information in 18 states including type, type of audience, and educational media used. Similar, local coalitions have developed as a result of AOE's example, allowing for ongoing regional cooperation and statewide referral.

Conclusions: Given the limited resources available, and the current proliferation of activities involved in AIDS education, AOE has lowered the effective utilization of resources, coordinated among participants, and an effective method for coordination of regional and state activities.

T.E.P.59

IN SUDANESE COLLABORATION WITH THE OIC ET LE PROGRAMME NATIONAL DE LUTTE CONTRE LE SIDA EN L'ONG - LA CONFERENCE CLINIQUE DES LES SIDA (CCLS)

Nabilou Sam J., Labou J.M., Bernoulli B., Lami A.*

* Organisation Mondiale de la Santé (OMS). Programme national de lutte contre le SIDA (ONG), Genève, Suisse; ** Médecine du Monde OMD, Paris, France.

Objectif: dans le cadre d'une action spécifique de formation, développer une collaboration entre l'ONG et l'OMS et inscrire dans les plans nationaux de lutte contre le SIDA deux des pays africains.

Méthodes: A la suite de la signature d'un protocole d'accord entre l'ONG/OMS et Médecine du Monde, six séminaires d'un semaine ont eu lieu, de décembre 87 à novembre 88, dans les pays suivants: Omdurman, Khartoum, Gonder, Addis Abeba, Oua D'Abouja. Organisés par Médecine du Monde, six séminaires ont permis: pour le SIDA de former des fonctionnaires de haut niveau sur le SIDA pour environ 20 à 40 participants dans chaque pays, de sensibiliser le corps médical de ces pays aux stratégies élaborées par l'ONG et les OMS/OMS de lutte contre le SIDA (OCS), d'instituer une commission de la prise en charge des malades et des épidémiologistes.

Résultats: - Le SIDA des six pays sur un total de 215 participants à huit séminaires de responsabilité ont reçu une formation sur le SIDA. - La collaboration triangulaire entre l'ONG/OMS, Médecine du Monde Paris, et les OMS dans les pays a parfaitement fonctionné. - Les séminaires ont permis aux participants de Médecine du Monde d'établir des contacts directs avec l'ONG et les OMS et d'être partiellement responsables de la lutte contre le SIDA dans les pays concernés.

Conclusions: - Les OMS peuvent et doivent s'engager dans les programmes de lutte contre le SIDA élaborés par l'ONG et les OMS. - Cette collaboration dans le cadre de la formation doit continuer et s'étendre à d'autres aspects de la lutte contre le SIDA.

T.E.P.60

A PROPOSAL FOR A PERMANENT INTERNATIONAL FORUM OF NODS WORKING WITH AIDS

Almeida, Wellington*, Braune, F.W.*; Cardoso Jr. R.P., Daniel, R.P.*

* Brazilian Interdisciplinary AIDS Association (AIIA), Rio de Janeiro, Brazil.

Objective: To propose the creation of a permanent international forum (PIF) of NODs related to the AIDS epidemic in order to exchange experiences, articulate activities and progress and increase the effectiveness of each organization.

Methods: A list of all NODs related to the AIDS issue was drawn up and approx. 500 circular letters were sent out by AIIA explaining this proposal to NODs in Latin America, Central America, Caribbe, Europe and USA. It was also suggested that the initial site for this encounter be at the V AIDS CONF. contacts with key persons in various countries were made to compose a steering group to link the proposed forum with Programme Committee and secretariat of the Conference, so that a date and place be set during the event for a first session.

Results: The response to the letters was highly positive, and suggestions were made for a workable timetable for sessions during the Conference.

Conclusions: Many NODs face insurmountable difficulties establishing network activities programs within their respective countries as well as across national boundaries. Amongst them, they are the reality of AIDS at grassroots level, the need to directly involve the general public and community support, the little has been done to tap this potential in fight against AIDS, mostly in the Third World context. The V International AIDS Conference on AIDS offers a unique opportunity in this direction.

Session d'affichage Poster Session

T.E.P.67

SURVEY OF THE CLIENT STRUCTURE OF THE AUSTRIAN AIDS FOUNDATION'S COUNSELLING CENTRE IN VIENNA, JULY 1987-DECEMBER 1988
Hutterer, Judith, Brandstätter, R., Vogl, G., Piribauer, F. J.

Österreichische AIDS-Hilfe (Austrian AIDS Foundation) - ÖAM, Vienna, Austria.

Objective: To give a survey of the composition of the clientele of Austria's most frequented HIV/AIDS counselling centre.

Methods: Evaluation of the 3,600 clients who frequented the Vienna counselling centre of the Österreichische AIDS-Hilfe (ÖAM) between 1 July 1987 and 31 December 1988. This centre is one of seven in a nation-wide network of anonymous and free HIV/AIDS counselling centres operated by the Austrian AIDS Foundation in which teams of psychologists, physicians and social workers offer information and advice, anonymous physical and telephone counselling, psychological help, care and support, and anonymous and free HIV antibody testing.

Results: 643 of these 3,600 clients were men, 365 women; 803 stated that they were heterosexual, 145 homosexual or bisexual; the sexual orientation of 65 was not stated; 67% of the clients declared to have an HIV antibody test, 94% of them tested negative, 5% tested positive. A more detailed presentation concerning factors such as risk behaviour, frequency of visits to the counselling centre, age, etc., will be given at the poster session.

Conclusions: The information and counselling offered by the ÖAM are, to a large extent, accepted both by the general population and by the so-called risk-groups: the ÖAM, however, focusses on the care and support of HIV positive people and Pals.

T.E.P.69

A 40-HOUR TRAINING PROGRAM IN AIDS FOR PUBLIC HIGH SCHOOL TEACHERS

Fernandes, Maria Eugénia¹, Pinel, A., Nardi, M.A.,²
Abud, N.,³ Ising, A.,⁴ Engelse,⁵ J.O.S., São Paulo, Brazil

¹Centre de Referência e Treinamento, ²IOS, ³USO, ⁴USO, ⁵USO, São Paulo, Brazil

Objectives: To train teachers from the public school network on AIDS.

Methods: A 40-hour training program on human sexuality and AIDS was developed by the Education and Training Unit of the Center of Reference and Training in AIDS as a complement to a booklet that would be distributed by the Secretariat of Education of the State of São Paulo to public high schools. The program consisted in 16 hours of human sexuality (gender identity, gender role behavior, sexual orientation, childhood sexuality, adolescent sexuality, anatomy and physiology, condom use), 16 hours of AIDS (biological, psychological and social aspects), and 8 hours of teaching methodology and AIDS. The format included lectures, discussion and audiovisual presentations. A pre and post-test was applied and a subjective evaluation was required from each participant.

Results: 150 teachers were trained in 2 groups. Despite the fact that there was a significant increase in the knowledge about AIDS as seen in the post-test, the majority of the participants did not feel ready to pass the information to colleagues and students.

Conclusion: Training must be followed by a support program.

T.E.P.71

AIDS SERVICE ORGANIZATION: LESSONS FROM STRATEGIC PLANNING AND ORGANIZATIONAL DESIGN

Rector, Richard¹, Waylun, S², Gross S³

¹Health Consultant - AIDS, ²World Health Organization, Regional Programme on AIDS, Copenhagen, Denmark ³World Health Organization, Geneva

Objective: To identify strategies to deal with the evolving organizational and management issues identified by AIDS Service Organizations as priorities.

Methods: Outcome of a meeting of AIDS service organization in Vienna, Austria, 28 February - 3 March 1989. Forty organizations from 23 countries were represented.

Results: The capacity of AIDS service organizations to initiate, fund and manage programs was being reached. Strategic planning and organization design are prerequisites to overcome organizational and management challenges.

Conclusions: AIDS Service Organizations have the technical expertise to provide client services. However, their organizational objectives must be clarified, administrative frameworks delineated and resources better allocated.

Le SIDA, la société et le comportement AIDS, Society and Behaviour

T.E.P.68

RECHERCHE D'UNE STRATEGIE DE COMMUNICATION EFFICACE CONTRE LE SIDA

Ducloux, Bernard, Université Laval, Québec, Canada.

Objectif: Déterminer pourquoi les reportages et les campagnes de communication d'ont pas réussi à changer les comportements des individus dans les pays occidentaux.

Méthode: Comparaison des études sur la mémorisation des messages et les changements de comportement des individus.

Résultats: Un sondage Gallup mondial de janvier 1988 estime que 80% de la population des 40 pays interrogés ont au courant du SIDA. Le taux de mémorisation des campagnes anti-SIDA en 1988 s'éleva à plus de 70%. Mais la crainte d'être contaminé par le virus est de 10% en moyenne. Pourquoi?

1. Le SIDA est la maladie des autres. Les campagnes sont faites pour nous dire comment nous protéger.

2. Les campagnes anti-SIDA sont confrontées aux valeurs religieuses et sociales de chaque société.

3. Toutes les campagnes ont été orientées vers les changements de comportement, ont été de nombreuses années à se réaliser (la cigarette).

4. La résistance aux politiques publiques à parler de sexe.

Conclusion: Les stratégies anti-SIDA ne le SIDA ne sont pas efficaces car on a sauté l'étape de l'information sur le SIDA pour parler des moyens de s'en protéger.

T.E.P.70

AIDS - NEW TYPES OF PUBLIC HEALTH PROGRAMS IN WEST-BERLIN

Anders, Rüdiger, Bergmann, J., Henschel, H., Giese, P.¹

¹Working Group AIDS of the State Department for Health and Social Affairs of the Berlin Institute for Tropical Diseases, Berlin, F.R.G., ²Max von Petten, Berlin, F.R.G.

Objective: How serious are they in the context of AIDS only those measures can be effective which consider and accept individual needs and conditions of the different target groups. Public health institutions therefore have to develop new types of programs based on this principle.

Methods: In West-Berlin 3 programs have been implemented in this sense by support of the Working Group AIDS of the Department for Health and Social Affairs of the Tropical Diseases.

1. Since May 1987 an AIDS Information Program for Schools, carried out by specially trained voluntary groups of teachers (volunteers).

2. since May 1987 a "Prevention Abstinence Program" for prostitutes in danger of infection from clients; as the main method: 100% abstinence with an anti-fall-back group for prostitutes.

3. since Oct. 1987 a Health Information and Counseling Team (1 doctor, 1 psychologist, 1 nurse and 1 social worker) for the staff of local outpatient services.

Results: until Dec. 31, 1988: 1. About 6700 students aged from 13 to 22 were given instructions on sexually and AIDS during normal lessons. Their level of information has considerably increased. 2. About 300 women could be offered employment which would not be subject to sex prostitution voluntarily. The on-call-out service was only to 70%. 3. About 200 staff members of local outpatient services could be instructed and encouraged to accompany patients with HIV and AIDS into their routine of daily practice.

Conclusions: The obvious success of these new types of measures - all of them are accompanied by scientific evaluation studies - indicates the possibility of developing similar target group-linked programs in other big city areas with large numbers of people with HIV and AIDS. Such programs can possibly serve as prototypes for further public health strategies.

T.E.P.72

PLACING EDUCATIONAL INTERVENTIONS WITHIN THE CONTEXT OF COMPREHENSIVE SOCIAL POLICIES TO REDUCE THE SPREAD OF HIV INFECTION.

Reuter, A., Shitka, M., The Hebrew University & Hadassah Faculty of Medicine, Jerusalem, Israel.

Objective: To assess if there are no bio-medical means to either prevent HIV infection or cure AIDS, it is a mistake to assume that the only, or even dominant means available to reduce the risk of HIV infection are educational. Other means which could be used from the basis for a comprehensive social policy are sometimes. These are both of a "Health Promotion" and a "Health Protection" nature, sometimes combining elements of both in one measure. I propose to consider the following measures as examples of the elements that can compose such a policy and to consider their implications and ramifications: 1. the direct and indirect use of medico-economic and socio-economic incentives, among vulnerable groups, to promote early testing and recruitment into preventive programs; 2. lowering economic and social barriers to the use of risk-reducing measures; 3. feeding drug addiction socially as a disease and address it as ill people, rather than criminals, while keeping an authorized drug production and distribution illegal; and, 4. considering and studying different strategies to free or at-cost distribution of injectable drugs under medical supervision, within comprehensive programs, as part of the effort to stem the spread of HIV infection among IV drug users.

Among the implications which I intend to discuss are: possible objections from established social power and professional groups; reactions of organizers; influence on drug addiction and on drug-related crimes; and, the influence on disadvantaged groups.

W.E.P.1

STRUCTURE OF AMERICANS' KNOWLEDGE REGARDING TRANSMISSION OF HIV INFECTION: IMPLICATIONS FOR TARGETED EDUCATION.
Sullivan, Varda, Schell, B.J., Aral, S.O., and Bowen, G.
Centers for Disease Control, Atlanta, GA USA

Objective: To identify racial and ethnic differences in underlying basic conceptual components of knowledge about modes of HIV transmission.
Method: We analyzed responses of 17,699 adults to the AIDS Knowledge and Attitudes Supplement of the 1987 National Health Interview Survey, drawn from a nationally representative sample of households. Underlying components of knowledge about HIV transmission were identified separately for Blacks, Hispanics, and Whites, using principal components analysis.

Results: a) The proportion of correct responses was significantly higher for Whites than Hispanics and Blacks, on some items, such as who was most at risk for AIDS (41%, 51%, 50%, respectively, p<0.05), and transmission via mosquitoes (31%, 24%, 24%, respectively, p<0.05) b) Despite differences in levels of knowledge, similar underlying components, which accounted for the same proportion of total variability, were identified in all three groups. They were: general misconceptions of HIV transmission (explaining 31% of the variability), followed by very risky behaviors (13%), transmission via body fluids (9%), transmission via sex and mosquitoes (7%), and transmission without physical contact with a person with AIDS (7%).

Conclusions: 1) Areas in which Blacks and Hispanics have less knowledge than Whites should be addressed through content specific educational interventions targeted to the group. 2) Future educational messages should be prepared in accordance with the basic conceptual structure underlying cognition of transmission.

W.E.P.3

BIDN, ÉPIDÉMOLOGIE ET CULTURE EN AFRIQUE CENTRALE
BIDN, EPIDEMIOLOGY AND CULTURE IN CENTRAL AFRICA

Dr. Jean-Marie Mouton, Dr. Roger Nkomo, Dr. Raymond Nkomo, Dr. Jean-Marie Mouton

School of Public Health, Boston, USA; ** Institut Démographique National, Kinshasa, Zaïre; ** Institut Démographique National, Kinshasa, Zaïre.

OBJECTIFS: Comprendre la construction culturelle du BIDN et ses relations avec les pratiques sexuelles, la procréation, le mariage et les croyances communes afin de faire face aux contraintes de la prévention.

MÉTHODES: Observation-participative, entretiens en profondeur, récits de vie, lectures bibliographiques, analyses de documents, recherche-action psychosociale.

RÉSULTATS: Des valeurs ancestrales telles le casier de procréer beaucoup d'enfants, des croyances telles les liens entre la sexualité, la santé et la procréation et le caractère des relations sociales entre hommes et femmes, rendent difficile l'adoption du condom ainsi les croyances stables ont une procréation reproductive est déjà dépressive.

CONCLUSIONS: L'ethnographie et la recherche-act qui associe les intérêts à la résolution pratique des problèmes sont indispensables pour comprendre la portée du BIDN et limiter son extension dans la région. Elles démontrent la limitation des méthodes de prévention actuellement employées et suggèrent de nouvelles approches.

Mots-clés: sociologie, couples stables, prévention, méthodologie

W.E.P.5

TITRE : L'INFORMATION ET LA PRÉVENTION DU SIDA
ANALYSE COMPARATIVE DE DEUX PROGRAMMES NATIONAUX D'ÉDUCATION POUR LA SANTÉ EN AFRIQUE CENTRALE ET DE L'EST AFRICAINE

Dr. Denise Hertzog**

** NPS - OMS - GENÈVE

** Directeur de l'Éducation Pour la Santé - SERCAL

et Coordonnateur Programme SIDA Nihilus Centralafricain.

OBJECTIF: Comparer les programmes nationaux en identifiant les similitudes et différences d'approche éducatifs et les résultats obtenus à la phase initiale, afin de proposer les principes directeurs méthodologiques par une action de mobilisation sociale en vue d'un engagement de comportement.

MÉTHODE: Analyse des choix de politique éducative en fonction des contextes socio-culturels, démographiques et organisationnels de ces pays. Analyses des moyens globaux (par 1000 habitants adultes) et distribution par genre cible et par structure organisationnelle.

RÉSULTATS: Avec des objectifs généraux similaires, on constate une grande différence d'approche entre les programmes d'information, la participation de tous les secteurs de planification éprouve ces différences et facilite la mise en oeuvre des programmes. L'information médiatique est toujours limitée par des résistances culturelles religieuses et institutionnelles. Elle ne permet la contextualisation et l'intégration, que renforcée par une stratégie de promotion de santé.

CONCLUSION: C'est à partir de la mobilisation participative qui, progressivement, les activités I.E.C. développées dans les réseaux et services existants dans le secteur santé et, au-delà dans les secteurs de développement et les réseaux actifs-de-la-société

W.E.P.2

AIDS ACTIVISM: A MEANS FOR PRODUCTIVE CHANGE TO PROMOTE CLINICAL RESEARCH AND DRUG DEVELOPMENT.
William B. Mahlum, Veterans Gay and AIDS Activist,
A founding member of the Lavender Hill Mob, the Lavender Hill Education Project and the AIDS Coalition To Unleash Power (ACT UP), U.S.A.

Objective: To explain the positive role individuals can play in defining issues and setting national research agendas to promote a speedier and more humane process to develop drugs for the antiretroviral.

Methods: Through practical experience the presenter will explain the importance of careful development of positions, organizing out-of-classroom, interactive leaflets and the carrying out of sensitive and creative actions. Sample copies of leaflets and press clippings will be made available to those attending this session.

Results: A number of specific victories and failures of AIDS Activists efforts will be discussed.

W.E.P.4

LA SOCIÉTÉ SÉNEGALAISE FACE AU SIDA.

Dr. M. Ndiaye, Dr. M. Sarr, Dr. Fall, Dr. Touré, Dr. B. Ndiaye
Unité de recherches épidémiologiques et statistiques, DAST/Ministère du Plan et de la Coopération, Sénégal.

Objectif: Evaluer la compréhension du SIDA pour une prévention efficace.
Méthode: Enquête à bas et à proche buteaux auprès d'un échantillon de 5000 (5158 et plus)** Les méthodes statistiques de traitement (SPSS) et d'analyse factorielle des correspondances des variables.

Résultats des résultats: ** 12,6 % de la population ont une bonne connaissance de la transmission du virus, les sexes informés l'ont été par les journaux (3,2 % contre 7,2 % par la rumeur publique). Une bonne connaissance semble indiquer des comportements d'évitement du risque. Dans le groupe bien informé, 62,2 % ne s'exposent pas au danger contre 57,8 %, alors que pour les mal informés, les proportions sont de 56,3 % contre 43,7 %. Ces personnes, mal informées, sont peu disponibles au préservatif (64,9 %) et aux mesures préventives générales (51,7 %). Une bonne connaissance de la transmission est corrélée avec les catégories socio-professionnelles : 76,5 % des cadres moyens sont bien ou assez bien informés contre 32,5 % des sans profession.

Conclusion: L'enquête réalisée avant le lancement de la campagne nationale d'information montre que la population de la capitale est globalement mal informée. Les résultats de cette étude devraient permettre la mise en oeuvre d'une politique de prévention plus adaptée tenant compte des contraintes identifiées dans cette étude.

W.E.P.6

Computer Simulation as a Tool to National Problem Awareness.

ASA, Arendal, **Arvidsson, Jose J., Myrvang, M., Vavik, L.,**

University of Applied Sciences, Høgskolen, Norway.

AIDS has given rise to unfamiliar problems. Knowledge of epidemiological facts and interrelations had become less important, for epidemics were supposed to have become a thing of the past, and have just any importance they may once have had for modern society. The appearance of a sexually transmissible disease for which it is hardly likely there will be a cure or a vaccine in the near future came unexpectedly.

Using novel methods we address the crucial problem of educating the public in order to reduce the spread of HIV through behavior change and appropriated measures. It is now possible for any school to have a personal computer (PC). One has in this way access to data processing equipment which only 15 years ago would have served a whole university. The advantage of such computers is that they can rapidly process huge amounts of data and, if the user so decides, carry out simulations of complex situations. Our program, AIDS Information, Modification and Simulation (AIMS), is a user-friendly program for schools and (in an advanced version) for doctors and medical personnel. It offers geographical, demographic and epidemiological facts; the freedom to focus these facts in any way the user chooses; the means of representing them in plastic form; the chance to undertake and explain to others their interrelations, and to represent concretely their abstract significance for individual behavior.

W.E.P.13

THE USE OF INDIGENOUS WORKERS FOR AIDS OUTREACH
EDUCATION/PREVENTION
Aster, Rebecca S.
NATIONAL Institute on Drug Abuse, Rockville, Maryland USA

Objective: To present issues and solutions for hiring and training local persons outreach workers.
Methods: By anecdotal information gathered by informal survey with 58 sites around the USA in AIDS funded programs who have hired at least one indigenous outreach workers.
Results: The foundation of 58 AIDS funded outreach research demonstration projects rests on indigenous (ex-addicts) outreach workers to educate and motivate addicts who are not in treatment and their sexual partners to change their AIDS behaviors. Because of their ex-addict background, these outreach workers present a unique challenge to program management in terms of (1) hiring; (2) orientation; and (3) training. In addition, program management must confront ethical issues because of exposure to workers of dangerous drugs, medications, exposure to an atmosphere where the workers are vulnerable to relapse, and helping workers who contract AIDS because of past risky behavior.
Conclusions: All outreach workers need to be aware of these issues and develop policies and strategies which are specific to this population of employees. Suggestions include special attention to job descriptions, the interview and hiring process, time management, development of career ladders and management of staff contamination and anger. Reassignment should also be prepared to help staff develop writing and communication skills.

W.E.P.15

EDUCATION STRATEGIES FOR HEALTH CARE WORKERS AND PRISONERS IN MALES. GEORGE, A.B., WELSH O'LEARY, GARDIFF, WALES AND GRIFFITHS, T.D. WEST GLANMORGAN HEALTH AUTHORITY, SWANSEA, WALES

OBJECTIVE: To describe methods of providing regular updates of information on AIDS to two specifically targeted groups.

METHODS: (1) Health Professionals: a core team with expertise in epidemiology, research, health promotion and nursing was established by professional organizations and a Government Department. The team visits each health authority on a regular basis at approximately six monthly intervals as a "road show". Health care workers from many disciplines attend.

(2) The programme for prisoners is targeted at short-stay young offenders and long-stay adult prisoners. Issues covered are drug abuse, other sexually transmitted diseases and AIDS. The approach has recently been changed to target prisoners just prior to release so as to maximize the impact. This programme is run by a health promotion officer not a multi-disciplinary team.

RESULTS: Several thousand health care workers have participated and demand continues to increase. This programme has run for 2 years, as has that for prisoners.

CONCLUSIONS: A small multi-disciplinary core team is an effective way of regularly updating health care workers. Prisoners require a more intensive approach and the use of a dedicated health promotion officer has been found effective.

W.E.P.17

EVALUATION OF AN EDUCATIONAL PROGRAM
KNOWLEDGE, BELIEFS, ATTITUDES AND BEHAVIOUR
ABOUT AIDS IN THE 147000 AIDC GROUP.

Böhm W., Hochmann W., Hübner B., Seyen R.***
Sen.F.Schäwe-Berlin** *BGA-AIDS-Zentrum *FEDERAL REPUBLIC OF GERMANY
tagl.*WHO/CDC Come Paris, FRANCE

Objective: To assess the KNOWLEDGE, BELIEFS, ATTITUDES AND BEHAVIOUR of 147000 students from 1470 schools in Germany. (Böhm W. 1987) and the optional school program to inform on AIDS by social trained physicians or biologic teachers.
Methods: Knowledge about transmission, risk factors, use of condoms, attitudes, beliefs and former sexual education were collected by a questionnaire with standardized and open questions before(n=770), four weeks(n=572) and six months(Sept.88) after(n=431) the lessons.
Results: After six months there was a higher acceptance of using condoms, and still very high level of information about ways of transmission and risk factors. Coping with fear, confidence, stable partnership, communication and the composition of aids condoms are most important factors to prevent HIV-infection. Only 11% proposed instead of enlightenment, measures of repressive control. Although 90% of the students had sexual education <2% had learned to speak about feelings and emotions related to sexuality. Students would not isolate HIV-persons.
Conclusions: Six months after the AIDS information lesson students still have a high level of AIDS related information and competence. They are interested in more lessons about sexuality and partnership, and about AIDS as a social problem. The approach of "personal prevention" is a necessary measure, which leads to better the preventive information given by the mass media ("massive prevention") and the necessary preventive acting of adolescents.

W.E.P.14

AN INFORMATION, EDUCATION WORKSHOP TO INCREASE CONDOM USE AMONG MALE BAR WORKERS IN BANGKOK
HERASITY SUWITTAI, NODDY RV*, Center for AIDS Research and Education, Bangkok, Thailand; **Festy Health International, North Carolina, USA.

Objective: To evaluate a workshop for increasing condom use among men who work in bars and who are at risk for HIV infection.
Method: We conducted workshops in 3 bars and 2 bars served as controls. The workshop consisted of a play, a video of an interview with that person with AIDS and an informal question and answer period. Free condoms and lubricants were provided in all study bars during the study. We compared knowledge about HIV infection, attitudes about condom use, reported condom use and sexual practices.

Results:

	Pre-workshop	Post-workshop	Survey	Control
Knowledge Score, Mean(Kang) 8.1(3-14)	8.1(3-14)	9.6(5-14)	8.6(3-13)	8.6(3-13)
Attitude Score, Mean(Kang) 4.6(1-6)	4.2(1-6)	4.6(1-6)	4.6(1-6)	4.4(1-6)
Customer used condoms	214	278	474	574
Bar worker asked customer to use a condom	554	444	474	584
Bar worker used condom	424	374	474	524

Pre- vs post-workshop in study: group-1) 1) expect vs control; group post-workshop. **p<.05 pre vs post; survey in control group.
Conclusions: The workshop was able to increase the knowledge about HIV infection but changed attitudes about condom use little. Unexpectedly, condom use increased more in the control than in the experimental group.

W.E.P.16

LES SERVICES À DOMICILE: LA PERSONNE CILIBOISE.
Duroan, Céline; Oursenan, A; Fortin, R.; Gagnon, P.; Chénier, J.-J.
CLICC Méro (Centre local de services communautaires), Québec, Canada

Les services à domicile. Le CLICC Méro est un organisme para-public qui offre des services de soins et de services sociaux courants à sa population. Le CLICC dispose d'un programme de services à domicile que les équipes d'infirmières, physiothérapeutes (auxiliaires familiales, ergothérapeutes, infirmières, infirmières, physiothérapeutes et travailleurs sociaux) visitent des personnes ayant besoin d'aide dans leur milieu de vie. Actuellement, une vingtaine de aidés requièrent ces services. Cette situation représente un défi à la fois personnel, professionnel et organisationnel.
Problèmes identifiés. Les personnes atteintes de SIDA font face à des problèmes d'ordre physique et psychosocial tandis que les intervenants pour leur part, vivent des situations nouvelles, parfois difficiles et stressantes. Ces faits de fait demandent des ajustements à l'organisation fonctionnelle par les équipes d'intervenants habilités à travailler à domicile avec une clientèle âgée et handicapée.
Éléments du modèle d'intervention. Le modèle personnel fait appel à divers éléments et ressources qui ensemble, contribuent à l'amélioration des conditions de vie des aidés et à domicile et à la qualité des services. Ces éléments sont: l'approche globale, les liens avec les ressources médicales et communautaires, la concertation de l'équipe, la formation et le financement.

Conclusion: C'est le personnel d'abord, en tant qu'individu, qui est considéré dans l'approche et c'est la vie et non seulement le maladie qui détermine les interventions. Les six éléments du modèle d'intervention ne doivent pas être examinés séparément mais faisant partie d'un tout. Ils sont indispensables afin de relever le défi de façon optimale et afin de maintenir une plus grande qualité de services auprès de la clientèle aidée.

W.E.P.18

SCHOOL AND COMMUNITY PARTICIPATION IN AIDS EDUCATION
MARK J. ARON, Chairman, AIDS Education Task Force,
Sydney Catholic Education Office, Sydney, Australia.

OBJECTIVE: To develop and implement a comprehensive education program, teaching knowledge, skills and values about AIDS for students aged 5 to 18 years in a large school system, and through teacher education and school-based parent meetings, to reach out to the wider community with AIDS education.

METHODS: During 1987 a comprehensive teaching kit consisting of print and audio visual materials was produced to teach, both about HIV infection, and how to care for people with AIDS. It is a resource-based, interactive approach which not only provides knowledge about AIDS, but also teaches skills (eg communication, decision-making, assertiveness) and values (eg love, respect for human dignity, compassion, hope) in response to the AIDS crisis. In early 1988 implementation of the program began, after a series of intensive 4 hour teacher education sessions ensured that every school had at least one member of staff trained to use the kit to educate their staff, parents, community members and students.

RESULTS: Over 50% of the 200 Sydney Catholic schools began AIDS education using the kit in 1988 for activities including teacher education, community meetings and integrating AIDS education for students into all relevant areas of the curriculum. The success of elementary schools was particularly impressive. There is continuing widespread use of the audio-visual systems and health education in the teaching kit.
CONCLUSIONS: Successful teaching and values education programs about AIDS are essential. Schools can provide AIDS education for the community.

Le SIDA, la société et le comportement AIDS, Society and Behaviour

W.E.P.19 KNOWLEDGE AND ATTITUDES OF ITALIAN YOUTH ABOUT AIDS
(Co-ordinator: Rosalinda Fresco, R.; Mattioli, G.;
Caldesi, M.; Nio, C.R.)
Dpt. of Biomedicine, University of Pisa, Pisa, Italy.

Objective. To evaluate the effects of educational campaigns about AIDS on the awareness and the perception of the problem by the youth.
Methods. A self-concept questionnaire was administered to 3300 Navy recruits and to 2437 high school students from the city of Pisa.
Results. Fifty percent indicated newspapers and TV television as major sources of information, only 14% the school. The information provided was judged sufficient and easily true, useful and clear; nevertheless most people (90%) requested further information mainly from doctors. On the whole, knowledge about the etiologic agent, mode of transmission and risky behaviour was satisfactory, while clinical symptoms, vehicles of infection and preventive measures appeared less well known. There were, however, marked differences between the two groups in terms of residence: youth from Northern and Central Italy with upper instruction showed a more precise perception of the AIDS problem. Concerning psychological reactions, 60% declared some impact on their social life, but there were again considerable differences among different groups.
Conclusions. The study indicated the need of systematic and continuing results of educational campaigns in order to correct possible errors in information strategies.

W.E.P.21 PEDIATRIC AIDS SOURCEBOOK
Allibonati, Rosalinda, J.A.
National Association of Children's Hospitals
and Related Institutions, Alexandria, Virginia, USA

Objective. To assist hospital and community-based agencies in planning programs of care for children with AIDS and HIV infection.
Methods. Nineteen programs in areas of high incidence of HIV infection providing pediatric care were identified and surveyed. A review of literature and interviews were conducted. Information was then assembled, documented and disseminated.
Results. The sourcebook is a compendium of current principles, plans and interdisciplinary programs that may be used as models of comprehensive care for children in primary, secondary and tertiary health care settings.
Conclusion. Many programs provide care in a variety of ways to HIV infected children. Common factors found include an interdisciplinary team working in a coordinated effort to provide comprehensive, child-centered, family-focused intervention to meet the complex needs of these special children and their families.

W.E.P.23 AIDS INFORMATION IN FRENCH SCHOOLS: AN EXPERIENCE AND A SOCIOLOGICAL VIEW
Bouquet, Françoise; Kalamazoff, M.***; Crispin, S.***;
L'Yvignat, C.; Moreaux, D.; Delamarre, A. et al.
* Unité d'Onco-Hématologie, Hôpital St-Jacques, Paris, France.
** Santé scolaire du Rectorat de Paris, France.
*** Santé scolaire du Rectorat de Créteil, France.

Objective. To evaluate an AIDS information model for youth at school.
Methods. During the school year 1987-88, 4500 students from Paris and suburbs, from 13 to 25 years old received a pilot information. This model was personalized, supported visually by video 8 slides and dramatic but non-formal, e.g. suggesting questions and dialogues among the classes.
Results. 1707 open questionnaires have been answered: 1512 by students who followed the information (mean age = 18; sex ratio = 1/2). 186 by "control" students (mean age = 18; sex ratio = 2/3).
Results. 1/ If the information model improved the students' recognition of risks related to the frequent change of sex partners. 2/ It convinced them that condoms are efficient if of good quality and used correctly. 3/ However, the model did not change their intention (74% in both groups) of using one in a "one-night stand with an unknown partner", as described in the questionnaire. 4/ The model did not change use of existing condoms and mutual respect of each partner.
Conclusion. This information model improves the global understanding of AIDS among the students, without knowing if they will lead to a new behavior, some intentions expressed are encouraging: to refrain from one-night stands, to use a condom also for contraceptive aims to protect the partner whenever there is a doubt about one's own sexual history.

W.E.P.20 PREPARING TEACHERS FOR ADOLESCENT AIDS PREVENTION EDUCATION: YEAR TWO OF THE MASSACHUSETTS TEACHER TRAINING DESIGN

Bevelli, Gerald M.*; Greenston, K. and Rosenfield, S.***
*Massachusetts Department of Education, United States
**Massachusetts Department of Public Health, United States
***Massachusetts Department of Education, United States

Objective: To describe the effectiveness of a split three day teacher training on 1) their knowledge and attitude (related to AIDS), 2) their confidence for doing AIDS education, and 3) the impact of utilizing a Person With AIDS (PWA) in the team training design.
Methods: Fifty-three school districts participated. Changes in knowledge, attitudes and confidence levels were measured by pre-post-testing. Subjective feedback forms measured the effectiveness and utility of the training activities. The initial two day training included basic AIDS information, health behavior change strategies, effective education techniques, human sexuality, and interaction with a PWA. The third day, held 6-8 weeks later, covered grades K-12 learning activities, parent education strategies, and an opportunity to report on the process and progress of their AIDS education efforts within their respective schools and districts.
Results: A total of 210 faculty were trained. Statistically significant gains were noted regarding teaching strategies for working with HIV and AIDS diagnosed students and co-workers, answering questions about HIV transmission, and teaching about AIDS. Regarding the training activities, interacting with a PWA received the highest ranking for personal impact.
Conclusions: The split three day training design, and interacting with a PWA, has proven an effective methodology for increasing AIDS related knowledge and confidence. ~~Methods, results, and conclusions about the use of a PWA in the training design.~~

W.E.P.22 KNOWLEDGE AND ATTITUDE TO AIDS SHOWN BY UGANDAN SCHOOLCHILDREN, BASED ON A NATION-WIDE POSTER COMPETITION
Mueller, Olga*; Labega, J.*; Senoga, J.*
*League of Red Cross and Red Crescent Societies, Geneva, Switzerland
**Uganda Red Cross Society, Kampala, Uganda.

Objective. To determine the knowledge and attitudes of youth in Uganda concerning AIDS-prevention and -patient care after one years education campaign in the country.
Methods. On 1. 12. 1989, World AIDS poster day, Uganda Red Cross carried out a nationwide AIDS poster competition on the themes of AIDS-prevention and -patient care. The contents of the posters have been evaluated.
Results. Out of 6 major cities in Uganda, 20 schools contributed 97 posters. The median age of participants was 14 yrs. 85% mainly described AIDS-prevention as keeping to one partner, whereas only 3% emphasized the use of condoms. 17% insisted mainly on the use of sterile instruments. 100% of the children promoted the importance of caring for AIDS patients, emphasizing close relation, good food and medical care. The main problem, in 6%, was that the carrierstate of HIV infection was not fully understood.
Conclusion. The poster contents reflect the current state of the AIDS education program in urban Uganda. Schoolchildren have good knowledge and a positive attitude about AIDS.

W.E.P.24 AN HIV/AIDS EDUCATION AND TRAINING PROGRAM FOR LAW ENFORCEMENT OFFICERS
Middell, Willem Jaffe, B.*; Fedriche, R.***; Hancock, D.***
*City of Toronto Department of Public Health, Toronto, Ontario, Canada.
**Metropolitan Toronto Police, Toronto, Ontario, Canada.
***Metropolitan Toronto Police, Toronto, Ontario, Canada.

Objective. To give police officers sufficient understanding of HIV transmission and prevention for them to operate confidently and appropriately.
Methods. 10-week training video series and a public health educator (PHU) were developed by police and public health officials for use in an established decentralized police training format. Each session was conducted jointly by a PHU and a police sergeant (Sgt.) and a public health educator (PHU).
Results. From January to June 1988 all uniformed officers D-9600 of the Metro Toronto Police underwent the HIV/AIDS training module. Each of the municipal public health units participated in the sessions conducted within the jurisdiction of the metropolitan area covered by the police. New police procedures were developed within the context of a comprehensive Police Dept. Training Prevalence on Infection Control and the Metro Toronto Corporate Policy on AIDS. Procedures and policies were reviewed by the PHU while the PHU covered the curriculum on AIDS; both could then respond to questions. Prior to the implementation of this program there were numerous complaints from officers about possible HIV exposures and some community incidents. Following implementation there have been no complaints or criticism inside the Force or from the community, and appropriate contact have been maintained when blood-related incidents involving officers have occurred.
Conclusion. A highly organized and cooperative effort between local law enforcement and public health authorities has resulted in a decentralized HIV/AIDS training program that is concise and effective.

W.E.P.49 A NATIONAL STRATEGY DESIGNED TO REMOVE BARRIERS IMPEDING THE EFFECTIVE HIV EDUCATION OF YOUTH: FIRST YEAR'S ACHIEVEMENTS

Diane G. O'Neil, Ph.D., Kelly J. Pankler, D.Sc., Pam. J. Kolbe, Ph.D., Division of Adolescent and School Health, Centers for Disease Control, Atlanta, Georgia, USA; Robert A. Hays, Ph.D., Center for Disease Control, Atlanta, Georgia, USA; Robert A. Hays, Ph.D., Center for Disease Control, Atlanta, Georgia, USA

Objective: To describe the first year's achievements of a national strategy designed to overcome major barriers hindering implementation of effective HIV education for youth. **Methods:** In 1984, the Centers for Disease Control (CDC) sponsored 2 national efforts to identify barriers hindering implementation of effective HIV education for youth. Participants identified as major barriers the lack of 1) regional support from national education organizations; 2) educational policies, guidelines, and recommendations; 3) parental involvement and support; and 4) data describing HIV-related knowledge, attitudes, and behaviors among youth. The effectiveness of educational interventions to influence these factors. CDC initiated a national strategy supporting 1) a system of national educational organizations; 2) a system of national educational organizations; 3) a system of national educational organizations; 4) a system of national educational organizations. These education agencies provided effective HIV education for youth. National educational organizations provided national training for educators and 13 regional training organizations provided regional training for educators and 13 state training organizations provided state training for educators and 13 city training organizations provided city training for educators and 13 city training organizations provided city training for educators. **Conclusions:** First year's achievements rapidly reduced the first 3 barriers. This strategy may have applicability in nations that provide national-level support for implementing HIV education for youth.

W.E.P.50 A NATIONAL STRATEGY FOR THE DEVELOPMENT OF PROGRAMS ON SCHOOL HEALTH IN 1974: A NATIONAL STRATEGY FOR THE DEVELOPMENT OF PROGRAMS ON SCHOOL HEALTH IN 1974

Sheffield A.***, Kelly J. Pankler, D.Sc., Jones, J.; Jobb, W.; Martins, J.;***, Division of Adolescent and School Health, Centers for Disease Control, Atlanta, Georgia, USA; Robert A. Hays, Ph.D., Center for Disease Control, Atlanta, Georgia, USA; Robert A. Hays, Ph.D., Center for Disease Control, Atlanta, Georgia, USA; Robert A. Hays, Ph.D., Center for Disease Control, Atlanta, Georgia, USA

Objective: To describe a national model for the development of programs on school health education to prevent the spread of HIV infection. **Methods:** In 1974, the Centers for Disease Control (CDC) began providing technical and financial support to 1 local and 2 state education agencies that had the experience and capacity to help others plan, implement, and evaluate HIV education programs for youth. Each agency provided training for educators and 13 regional training organizations provided regional training for educators and 13 state training organizations provided state training for educators and 13 city training organizations provided city training for educators. **Conclusions:** This national model of educational training and technical support may have applicability in nations that provide national-level support for regional training/demonstration programs.

W.E.P.51 COMPARATIVE RISK PERCEPTIONS AND STD IN TWO DIFFERENT SOCIO-ECONOMIC GROUPS

Owens, Edward, Managosa, J., Aedeago, A., Surocinan, A., and Soyinka, K.

Chiefed, Awolowo University, Ibadan, Nigeria

Objective: To compare the level of awareness, cultural and social practices as well as attitudes to AIDS and STD in two different socio-economic groups with a view of formulating appropriate health education messages for HIV prevention.

Methodology: Pretested and modified questionnaires were administered to 110 randomly selected undergraduates and also to 70% (purposefully) selected individuals of lower socio-economic status. Questions were designed to cover awareness, knowledge, practices on AIDS and STD, sexual habits and preferred modes of receiving health education as well as individual assessment of existing health education material on AIDS.

Results: Undergraduates exhibited more knowledge of symptoms and prevention of AIDS than the rural dwellers. Whereas, the former indulged in higher risk practices than the latter, undergraduates were more acceptable and used by the former than the latter. Undergraduates preferred to learn more about AIDS through electronic media and newspapers while the rural dwellers prefer community health talks.

Conclusions: Health education against AIDS must be targeted to meet needs of different groups. For rural areas with low AIDS prevalence, health education with emphasis on safe sex is important. Campaign against HIV infection ought to be integrated with Primary Health Services.

W.E.P.52 UN EXEMPLE DE COLLABORATION ENTRE MÉDECIN ET JOURNALISTE

FOURCROT, J. ET METTICAT, J. EDLMANN

CHU DE LYON, FRANCE

Objectif: Analyser l'interaction sur le site d'un hebdomadaire destiné aux homosexuels (Qui Plus) notamment par le biais de la page intitulée "Info-Sida" qui paraît deux fois par semaine. **Méthode:** Une collaboration étroite et régulière a été établie avec une association spécialisée sur l'éducation et la prévention du SIDA (A.S.A.) et, en particulier avec le rédacteur en chef associatif. Ce a été d'ailleurs possible de proposer des informations ou de faire établir par le praticien médical, les articles publiés ou de leur être écrits en commun par un journaliste et un médecin au cours d'entrevues individuelles. L'interaction est devenue régulière et a permis de publier des articles de grande qualité et de les rendre plus accessibles à un public plus large.

Conclusions: Une coopération étroite et régulière entre un médecin et un journaliste a permis de publier des articles de grande qualité et de les rendre plus accessibles à un public plus large. Cette collaboration a permis de publier des articles de grande qualité et de les rendre plus accessibles à un public plus large. Cette collaboration a permis de publier des articles de grande qualité et de les rendre plus accessibles à un public plus large.

W.E.P.53 COMPARISON OF AIDS KNOWLEDGE LEVELS AND BEHAVIORS IN SEXUALLY TRANSMITTED DISEASE (STD) CLINIC PATIENTS AND ALTERNATIVE TESTING SITE (ATS) CLIENTS

Day, J.; Dillon, B.; Ross, John; Kancher, L.; Rossman, L.; et al. MA Dept. Public Health, Boston

Objective: To compare levels of AIDS knowledge and behaviors in persons attending selected urban STD and ATS facilities.

Methods: From 7/88 through 10/78, 1,063 (338 ATS, 665 STD) self-administered surveys of AIDS knowledge, behaviors, and demographics were completed. Knowledge scores and behaviors were compared by clinic setting, sex, and race. Demographics for STD respondents (STD) showed greater proportions of males (62% vs. 13%), female (38% vs. 29%), and adolescent patients (19% vs. 28) compared to ATS respondents (ATS).

Results: Bivariate preference was more common in STD than ATS (93% vs. 68%). The groups were similar with respect to sexual partners, history of nonconcurrent STD, needle use, needle sharing, and prior antibody testing. Fewer STD indicated a desire for testing than ATS (45% vs. 97%).

Based on a 10-point scale, ATS rated self-perceived knowledge levels higher than STD (mean score, 4.5 vs. 5.7) and objective evidence of knowledge was greater in ATS for all questions. Among STD, knowledge levels were higher among whites than nonwhites. ATS reported sexual behavior changes (fewer partners, increased condom use) more often than STD (53% vs. 18% and 48% vs. 37%). Reductions in ATS in needle intravenous drug use (19%) were similar to STD (stopped 17%). STD increased needle sharing, 25% vs. 35%.

Conclusion: Compared to ATS (who are test seekers), STD need greater educational and behavior modification efforts to reduce AIDS risk.

W.E.P.54 WHAT KEEPS PHYSICIANS FROM TALKING ABOUT AIDS:

Barriers to AIDS Prevention Education

Alford, Michael W., MD, Kaiser Health Education, Permanente Medical Group, Oakland, California, USA.

The specific aims of this study were:

- 1) To find out if primary care physicians in a large HMO setting were providing AIDS risk reduction information to their patients, and 2) to identify barriers that might prevent them from providing this information.

An anonymous survey was mailed to 650 physicians in a large Northern California Health Maintenance Organization (HMO). A usable return rate of 63% (423/650) was obtained.

Statistically significant differences in the willingness to discuss AIDS with patients were found to exist depending on the physician's perception of the patient's risk for AIDS. Use of Pearson correlation coefficients found that the most often reported barriers of "lack of time," "more important health issues," and "the need for more reliable information" did not correlate as a deterrent to providing health education as much as reported discomfort with initiating discussions of sexual practices or drug use. Chi-square analyses showed differences in providing AIDS prevention education were not statistically significant by age, type of practice, or location (urban or rural) of practice. There were statistically significant differences for sex of the physician, number of AIDS patients in their practice, and knowing someone (friend, relative or colleague) with AIDS.

These findings changed the direction and emphasis of physician education programs and were an essential part of the needs assessment used to develop clinic services to enhance AIDS risk reduction efforts.

W.E.P.61 THE JUDICIOUS USE OF HUMOR IN A CONDOM PROMOTION

CAMEROUN
Romney, A.M.; Kelleigh, B.M.; Welch, N.M.; Purdue, T.*
*University of Washington, Seattle, WA, USA; *Northwest
AIDS Foundation, Seattle, WA, USA.

The Northwest AIDS Foundation coordinates social services for people living with HIV/AIDS in the Pacific Northwest United States and sponsors skill-building workshops and mass media campaigns. The Be Well-Equipped media campaign (1987-8) was designed to promote consistent use of lubricants, spermicides and latex condoms. Humor became an integral part of this campaign based upon the belief that taboos about discussing condoms could most easily be abolished through humor. A community-based planning group helped the foundation to develop guidelines for using humor in AIDS prevention messages. Writer/Artist Lynda Barry created a series of condom promotion cartoons with titles such as: "Fascinating Condoms of the Future," "Can This Love Affair Survive?", and a Valentine's Day cartoon called "Born, Not Bought." Comments and testimony from the community was positive regarding this attempt to use humor in promoting safer sex. Guidelines for using humor in AIDS education will be discussed and the artwork for Be Well-Equipped will be displayed.

W.E.P.62 SIDAIDS: A COMPUTERIZED TELEPHONE AIDS INFORMATION & COUNSELLING SERVICE (TELEMA TIC)

Billon, P., Dackiw, S., Kavanagh, K., Champoux, J., Barbeau, T., and Demou, A.
*Communications Canada, Quebec, Canada;
*McGill Centre for Medicine, Ethics and Law, Montreal, Quebec, Canada.

OBJECTIVE: To describe a personalized telematics service providing information and advice on AIDS, accessible by the general public through any telephone (residential or public). Although the computer software and structure of the communications are complex, the service to users is highly user-friendly.
METHOD: A user consults the computer-driven service anonymously using a personal access code. The user can choose to communicate with a counsellor or a computer. The user receives replies to the following service(1) SIDAIDS communication clear and precise information on AIDS; and advice that take into account his or her personal situation(such as sex, marital orientation, etc.).
RESULTS: The equipment, computer programme and data collection are now defined that provide the following service(1) SIDAIDS communication clear and precise information on AIDS to anyone who consults the system about specific questions. This function is similar to the activity of many hotlines with respect to information on AIDS. In many cases, the user receives replies for personalization of the system without oversteering counselling(2) SIDAIDS promotes self assessment by the user or his/her coefficient. In many cases, the assessment involves several steps: each step covers a specific aspect of the individual case and includes educational elements(3) SIDAIDS establishes and maintains a continuing relationship between counselling and education, so as to foster changes in individual behaviour and thereby reduce the risk of contracting AIDS. In this regard, clients with "at risk" behaviour have priority access to the counsellor, and, as far as possible, a user in this category will have access, if he or she wishes, to the same counsellor, call after call(4) SIDAIDS permits a counsellor, at the user's discretion, to have access to all information ever entered by the user(5) SIDAIDS facilitates the collection of epidemiological and behavioural information for subsequent data analysis.
CONCLUSION: Principles are confirmed the feasibility and utility of the SIDAIDS mechanism.

W.E.P.63 Teduzo Gokubi, N. Kasimaini, E. Korosyiki*

THE KINSHASA CAMPAIGN IN HEALTH CITY PROJECT OF ZAMBIA

Sanitary-Epidemiological Station, Wodwa str., 40, 90-046 M66, Politicins of Zambia, Kinshasa, Zambia
OBJECTIVE: To describe the AIDS prevention campaign as one of very important tasks in the healthy city project of M66-Health for All by the year 2000.

METHOD: WHO/Unesco approach and principles for undertaking the health promotion of cities have been adopted. For the health surveillance the main AIDS risk group of about 500 nonorganised adult people has been chosen. They have been taught on AIDS, the healthy attitudes and risk behaviours by the questionnaire study.
RESULTS: The blood service intervention and health education have caused the implementation of AIDS precautionary measures among blood donors and drug abusers. AIDS problem is connected with the improvement of the survey on other groups. The questionnaire survey among adult risk group shows that their knowledge is on the sufficient level but their risk behaviours are unrelated to their knowledge as it is shown in the below table.
Condom use gives Do you use Are condoms Do you examine full security? Yes No Unknown Yes No Yes No Unknown Yes No Unknown
Is a lab? Yes No Unknown
Conclusion: The regular use of condoms should be practised especially by homo/bisexualists. They ought to receive them free.

W.E.P.64 EXTENDING THE ROLE OF AIDS HOTLINES IN AIDS PREVENTION PROGRAMS IN DEVELOPED AND DEVELOPING COUNTRIES

Saunders, Susan G.; Delquist, M.; Stein, J.; Cavanaugh, K.; Kavanagh, K.; Dackiw, S.; Billon, P.; Demou, A.*
*AIDS/CDC Project, The Academy for Educational Development, Washington, D.C.; *Brooklyn AIDS Task Force, New York; *National AIDS Committee, Trinidad and Tobago.

OBJECTIVE: To assess the role and function of AIDS hotlines in developed and developing countries.
METHOD: Literature review and in-depth interviews with key informants and hotline staff in community-based organizations and AIDS programs in the U.S., Mexico, Trinidad and Tobago, and Peru.
RESULTS: AIDS hotlines are an integral component of AIDS prevention programs in the United States, with operations at the community, state, and national level. Hotlines in the U.S. provide information dissemination, referrals, and listening support to callers. Hotlines also track trends in caller concerns, misperceptions, and service needs; and monitor levels of message awareness and recall provided through national information and education initiatives. Comparable programs which provide listening services and referrals are being established in several Latin American and Caribbean countries.
CONCLUSION: Hotlines are an important link in the communication chain to inform and support callers concerned about AIDS and HIV infection. Hotlines are frequently the first point of intake into the AIDS service support system in the U.S. In Trinidad and Tobago the hotline serves primarily as a listening support system, and in Peru it is being used to provide information to callers who are at high risk.

W.E.P.65 KNOWLEDGE AND PERCEIVED RISK OF AIDS AMONG THE LOW POPULATION OF KINSHASA, ZAMBIA

Bertrand, J.; Bakshuwidi, R.; Kinavidi, L.R.*; Balove D.; Kasimaini N. and Chivesa C.*
*University of Washington, WA, USA; *Projet des Services de Reinsertion D'adultes (PRSD), Kinshasa, Zaire.

OBJECTIVE: To measure knowledge of AIDS, level of perceived risk, and factors influencing perceived knowledge and perceived risk.
METHOD: Based on probabilistic sampling, 2085 men and 3661 women of reproductive age were selected for this 1988 survey.
RESULTS: In Kinshasa, 88% men and 96% women have heard of AIDS. Among these, nine in 10 men and women know the four main modes of transmission. Knowledge of specific facts about AIDS is higher among men than women, among the more educated, and among the age group 20-40. Forty-seven percent of men and 62% of women believe they are at no risk of contracting AIDS. Perceived risk was highest among those who had extramarital relations, were more educated, were 20-40, and had seen messages on AIDS through multiple channels. However, knowledge of the specific facts relating to AIDS was not associated with perceived risk.
CONCLUSIONS: Educational efforts have succeeded in informing the public of AIDS and the modes of transmission. Future campaigns should promote greater use of condoms, stress the absence of a vaccine or cure, and focus special efforts on the young, unmarried population that seemingly deny their risk of AIDS.

W.E.P.66 SECONDARY SCHOOL STUDENTS AS AIDS HEALTH PROMOTERS FOR AN ILLITERATE RURAL WEST AFRICAN COUNTRY

Bessell, Brian; Deaby, A.; and Kama, P.
Eastern Province AIDS Committee, Selbywa, Sierra Leone, W. Africa

In rural areas of Africa, where most of the population is illiterate and mass media are not available, AIDS health promotion is often difficult. Literate young people make up a small proportion of the population, but they traditionally bring news and information when they return to their villages. We recruited secondary school students, training them as pretested pamphlets and photovideos to teach villagers about AIDS. The young people used mass posters, radio, creative songs and dramatic presentations. A pilot programme showed that information about AIDS transmission and prevention was successfully conveyed by these means, but that the young people most often shared information with semi-literate people. The materials and training programme were redesigned so that the audience reached would be larger and more varied. Randomly selected villagers were interviewed before the programme and at one week, six weeks, and six months after it. Interviews included questions about programme exposure, AIDS transmission and prevention, sexual practices, and condom use. STD incidence is sexually active age groups in the villages will also be compared with pre-programme data. The programme is being planned Parenthood centres for condoms. We will discuss the design and limitation of our programme, including pretesting, preliminary evaluation, and recommendations as well as our conclusions.

Th.E.P.1 CONTRACEPTIVE UTILIZATION IN AND OUT OF THE MARITAL SETTING: IMPLICATIONS FOR THE TRANSMISSION OF HIV IN KINSHASA.

Piripiri L., Doupagne A***, Haming JC***, Moore M***, Bertrand ME***, Kasseba TD*
* Zaire School of Health, Kinshasa, Zaire; ** Tulane SPHIT, New Orleans, USA; *** Banque Comre Zaire, Kinshasa, Zaire

Objective: To determine and compare the level of contraceptive utilization in and out of the marital setting.

Methods: A working population in Kinshasa and their spouses were interviewed to obtain contraceptive and sexual histories.

Results: Overall 32% of 1063 monogamously married men (MM) and 47% of 1064 monogamously married women (WM) currently use contraception with their spouse. Condom usage with spouses was 2% in MM and 2% in WM. 12% of MM and 12% of WM used condoms for pregnancy prevention. Thirty-five % of MM and 2% of WM used condoms for contraceptive purposes. 12% of MM and 12% of WM used condoms in EHC was low (13% and infrequent (23% regular use). MM knew that condoms were effective against HIV, and this was associated with condom use in marriage (p<0.002) but not in EHC. Use of condoms in marriage was 4 times higher in men and women with a high educational level in the past year.

Conclusion: The potential for HIV transmission in this population is high, given the prevalence of unprotected extramarital relations. Education and counselling efforts for both family planning and prevention of HIV should take this into account.

Th.E.P.3 RISK FACTORS FOR HIV-2 INFECTION De Zakarias, B.,* Kage, Elinor,* Sjö, T,**, Marne, R.,* Essae, M.,* Mjöberg, S.,* et al. *Harvard School of Public Health, Boston, MA, USA; **University of Dakar, Dakar, Senegal

Objective: To determine the risk factors and hormonal parameters associated with HIV-2 seropositivity in a cohort of prostitutes in West Africa.

Methods: An analysis of 139 registered female prostitutes was performed on a subset of approximately 1100 prostitutes registered at an STD clinic in Dakar, Senegal. The HIV-2 seropositive females in the subset had been matched by age, nationality and years registered in the clinic with seronegative females, yet still were representative of the entire clinic population in age (2 years), nationality distribution and years in the clinic. The matched hormonal parameters were analyzed in relation to HIV-2.

Results: In a subset of 139 prostitutes, as well as in the clinic population, a slightly higher seropositivity rate to HIV-2 was associated with an original nationality outside of Senegal. Also associated with significantly higher seropositivity was the "wobbling" parameter usually seen with the non-Senegalese prostitutes ("Ches else" or "bottle setting"), continuing the above observation.

Interestingly, the seronegative prostitutes in the subset were more likely to have been previously hospitalized and to have a history of transfusion. No association was seen with HIV-2 seropositivity and female circumcision, scarification, tattoos or previous vaccinations, such as BCG. In evaluating the hormonal parameters concerning the prostitutes' children, no difference was noted in seropositives versus seronegatives in the number, health status or interchildhood mortality of their offspring. There was no difference in the age of first sexual encounter between seropositive and seronegative prostitutes. Estimates of the number of lifetime sexual partners, however, was significantly associated with seropositive status.

Conclusion: HIV-2, as with HIV-1, appears to be a sexually transmitted disease. Follow-up of the cohort will provide insight into the epidemiology and risk parameters associated with HIV-2 infection.

Th.E.P.5 CHARACTERISTICS OF MEN IN THE NATIONAL MORTALITY FOLLOWBACK SURVEY WHO DIED OF AIDS Rosen, J.,* Trent, J.** *NATIONAL CENTER for Health Statistics, Hyattsville, Maryland, U.S.A.; **State University of New York, Albany, New York, U.S.A.

Objective: To contrast the social and demographic characteristics, health care access and utilization of men who died of AIDS with those of other men.

Methods: Descriptive statistics are presented for data from a nationally representative sample of adults aged 25 or more who died in the USA in 1986. The sample consists of 18,733 decedents, 284 of whom died of AIDS. The data yields the first population level statistics on many characteristics of men dying from AIDS in the USA.

Results: Men dying from AIDS tended to be younger, were highly educated, and held higher status occupations than other men. They were more likely to suffer discrimination and need help with daily activities. Caregivers of AIDS decedents were less likely to be family members and more likely to be visiting homemakers or nurses. Use of physicians, mental health professionals and hospice care was also greater among men dying from AIDS than others.

Conclusion: The social, demographic and health characteristics of men dying from AIDS are considerably different than those of men dying from other causes. Understanding differences can help in developing programs to assist those who are infected with HIV. The NPHS data can provide information on many characteristics not available from any other source in the USA. As a nationally representative sample, the data can be used for generalizing to the population as a whole.

Th.E.P.2 MODELLING THE SPREAD OF HIV/AIDS AND ITS DEMOGRAPHIC IMPACT: A REVIEW OF APPROACHES

United Nations Population Division Task Force on AIDS** and A. Paloni**
*United Nations Population Division, United Nations, New York 10017;
**University of Wisconsin, Madison, Wisconsin 53706, U.S.A.

Objective: To review models of the demographic impact of AIDS developed by selected authors in light of modelling objectives, data needs, assumptions, algorithms and usefulness for assessing the impact of selected interventions.

Methods: Numerical information is reviewed on the nature of the HIV agent, modes of transmission, duration from infection to AIDS to death, and regional patterns. Current models are reviewed and classified according to their ability to incorporate behavioral, biological and epidemiological elements, and measure the demographic impact of behavioural and other changes.

Conclusions: Models requiring very few parameters are often uninformative from a policy perspective; those requiring many parameters were hampered by insufficient empirical data. Modelling results appear sensitive to assumptions of the shape of the incubation function, time distribution of infectivity, heterogeneity in sexual behaviour, and intervention among population groups.

Conclusions: In spite of shortcomings, models have already helped enhance our understanding of expected short and long-term demographic effects of women development, behaviour changes and blood screening. The extent to which numerical results depend on assumptions of parameter values, distribution functions and model structures is not clear at present. The Population Division Task Force will be further investigating these issues as part of its efforts to synthesize the results of world-wide modelling efforts.

Th.E.P.4 DETERMINANTS OF CONTRACEPTIVE PRACTICES AMONG INTRAVENOUS DRUG USERS IN NEW YORK CITY Aulick, Kenneth D., De Jager, De Fontaine, J. Therese A. Abdul-Quader* *National and Drug Research, Inc., New York, NY, USA **New York State Division of Substance Abuse Services, New York, NY, USA

Objective: To identify factors associated with contraceptive use among IV drug users in New York City.

Methods: Structured interviews with 463 IV drug users resulted through street outreach in New York City produced information about contraceptive AIDS risk behaviors, and socio-demographic characteristics. Analyses used cross-tabular and logistic regression techniques.

Results: Forty-two per cent (15/400) reported current use of contraceptive or other forms of birth control. Thirty-three per cent (13/400) used condoms. Contraception was significantly positively associated with education, stable housing, employment, number of sex partners, currently being in a sexual relationship, being non-Hispanic, and engaging in drug injection risk reduction practices. Contraception model (p<0.05) fit to be greater among younger and non-Hispanic subjects, but was not related to gender, having children, levels of alcohol use, or past psychiatric history. In seropositive logistic regression, the number of sexual partners, current sexual relationship, race, and walking drug related behavior change remains significant. Similarly, for condom use alone, the number of sexual partners, drug injection behavior changes, and involvement in a sexual relationship were significant predictors.

Conclusions: Among IVUDs, there is considerable contraceptive and condom use but not nearly enough to prevent pregnancy. Almost half of the sample practiced at least one form of contraception or birth control as an ongoing method. These findings associating education, working, and consumption are consistent with the findings from general population surveys. Since contraception consisted mostly of barrier methods such as the use of condoms, this should serve to retard HIV spread through heterosexual and potential transmission.

Th.E.P.7 CENTRE DE DÉPISTAGE ANONYME VOLONTAIRE ET GRATUIT DE MÉDECINS

DU MOEUF, PARIS, FRANCE. **ALEXANDER François** 1 LERAS 3* / MASSE B* / BODOSSA A**
* Médecine du Monde, PARIS, FRANCE.
** Laboratoire BODOSSA, PARIS, FRANCE.

Objectif. En juillet 1987, Médecins du Monde entreprend une action contre la pandémie du SIDA, en créant le premier centre de dépistage anonyme et gratuit du V.I.H. en France. Cette démarche qui a permis d'informer et de sensibiliser les personnes face à l'existence de ce fléau, sera reprise par les pouvoirs publics six mois plus tard.
Méthode. L'équipe est composée de médecins : 30 médecins hospitaliers et 11 infirmiers ; 5 psychologues, 1 infirmier ; 1 porteur d'informations ; 1 assistante sociale. Nos critères sont : l'accessibilité au test, le volontariat, l'anonymat, la confidentialité, la gratuité, et l'information personnalisée avec pour but la prévention. L'épreuve de séropositivité apparaît en dernier prioritaire et le travail de l'équipe psychologique nous semble important.
Résultats. Nous avons dépisté 280 personnes, dont 62% d'hommes, 33% de femmes. Le pourcentage de séropositifs est de 7,5%.

Conclusion. Il nous est apparu important de faire une étude sur le profil des personnes séropositives à partir du questionnaire anonyme et du carton réponse en représentant certains critères : le sexe, l'âge, la catégorie socio-professionnelle, le comportement sexuel, la toxicomanie.

Th.E.P.8 ESTIMATING THE PREVALENCE OF HIGH RISK SEXUAL BEHAVIOR WHICH HAS BEEN TESTED AND COUNSELLED FOR HIV IN 1986. **Johnston** Margaret, Douglas, J., Davidson, A., Denver State Health, Denver, Colorado.

Objective. To estimate the percentage of homosexual and bisexual men (OO) and heterosexual intravenous drug users (HVO) ever tested/counselled for HIV.

Methods. House surveys indicate that about 2% of men aged 18-60 consider themselves homosexual or bisexual (OO) and that are at potential risk of HIV infection. By December, 1986, Denver Public Health had recorded 5,128 HIV testing/counseling visits by OO. Because 0% or more tests than the estimated 4,528 of the Denver's population of 300,000. Because this approach does not account for multiple testing of individuals, we asked all patients waiting initial visits to the Denver Home STD Clinic 1/1/88 - 9/30/88 if they previously had been tested for HIV and recorded the numbers tested during the current visit.

Sexual Patient Group	No. Visits	No. Previously Tested (%)	No. Tested/Counselled Current Visit (%)	Total No. Tested (%)
Male OO	521	18 (3.5%)	286 (54.9%)	347 (66.4%)
Female HVO	275	122 (44.4%)	176 (63.3%)	213 (77.1%)

Conclusion. Based upon a stratified sample of patients attending an STD clinic, we estimate the 10-15% of homosexual men and 40-50% of heterosexual drug users who undergo HIV TC. For OO, 40% more of HIV acceptance decline prevalence of HIV in recent TC volunteers, a 100% increase in HIV AIDS cases of only 12% over 1987, and dramatically falling incidence rates for gonorrhoea, syphilis, and HIV infections after the success of 7 years of public efforts toward safer sexual practices and tests will for eventual control of AIDS in this risk group.

Th.E.P.9

Psychological Impact of Voluntary HIV Antibody Testing
Richard Jacobson, L., Flannery, R., Truong, A., Novick, R., Cornell Medical Center, New York U.S.A.

Objective: To assess prospectively the psychological effects of HIV testing in conjunction with individualized pre-and post-test counseling.
Methods: Stratified because of demographic variables were completed 7 weeks before HIV test notification, immediately before and after notification, and 10 weeks later by 216 seronegative adults (126 gay/bisexual men, 90 HIV drug users, all heterosexuals with suspected HIV-infected partners).

Results: For the 174 seronegative, visual analogue scale (VAS) measures of anxiety and depression fell immediately upon notification compared to scores at entry and immediately before notification (all p < .001), even though men seronegative (SN) had correctly predicted their results. Compared to entry values, their scores on SAS, Beck Depression Inventory (BDI), and State Trait Inventory (STAI) at 10 weeks after notification were all significantly decreased (all p < .05). Immediately after notification, the 40 seropositives had a transient increase in reported depression, but did not have significant decreases in the VAS measure of anxiety. At 10 weeks, after notification and continuing psychoeducational counseling, VAS depression had returned to its baseline. HIV had decreased significantly (p < .002) and VAS anxiety had decreased below its values at entry (p < .05).

Conclusions: HIV serological testing when combined with individualized counseling was emotionally helpful for both seronegative and seropositive research subjects at two months following notification.

Th.E.P.10

HIV ANTIBODY TESTING BY CANADIAN GENERAL PRACTITIONERS AND FAMILY PHYSICIANS
Kimball Thomas *, Sherman, J. *, Buning M. *, University of Ottawa, Ottawa, Ontario, Canada.

Objective. To assess HIV antibody testing by primary care physicians in Canada. **Methods.** A mailed questionnaire survey was used to obtain information from a proportionate, random sample of Canadian general practitioners and family physicians, stratified by geographic region and size of community. Replies, 80.4% of the physicians returned a completed questionnaire. Of the 823 respondents, 754 had ordered at least one HIV AB test in the last two months. Of these 625 physicians, 66% stated that the test was patient-initiated over three-quarters of the time. 11% of physicians received at least one positive result. 24% of physicians always obtained informed consent, 22% never do, 68% always do pretest counseling and 37% never do post-test counseling. Factors identified by logistic regression as being associated with those physicians who always pretest counsel and obtain informed consent include feeling a sense when pretest counseling, feeling concerned about HIV infection in their practice, and conduct routine risk assessment. 28% of all respondents stated they would inform the patient's partner of a positive result without the patient's consent, 22% would sometimes. **Conclusion.** Much of HIV testing is patient initiated. The importance of informed consent, carrying out pretest and post-test counseling needs to be emphasized.

Th.E.P.11

TELEPHONE SCREENING FOR MEN AT RISK OF HIV INFECTION
Lewis C.E. *, Frazee, H. *, Montgomery, E. * University of California at Los Angeles, Los Angeles, California, U.S.A.

Objective: To test the feasibility of conducting telephone interviews with a random sample of men in Los Angeles to determine their engagement in activities placing them at high risk of HIV infection and to assess the effects of feedback on their degree of risk (low/increased) on their follow up of this information.

Methods: Random digit dialing telephone calls were placed to residences; men age 18-60 were asked to participate in a risk-assessment interview. Those determined to be at increased risk were so informed and given a toll-free 800 number to call for further information, counseling, and referral for a free medical evaluation, if indicated.

Results: Seventy-percent of men contacted were interviewed; 1,610 interviews were completed, half in 18 census tracts, with an incidence of 19.2 cases of AIDS per 1,000 men. The rest represented all other areas of Los Angeles. 4.7% of men stated they were homosexual/bisexual. Of heterosexual men, 12.3 had 2+ partners in the past 2 years. Rates of HIV testing were associated with degree of risk. Overall, 14.7% (adjusted for oversampling) of men in Los Angeles had been tested for HIV antibodies. Despite facilitating access to counseling/refs, only 4% of those at risk took advantage of the assistance offered and called the 800 number.

Th.E.P.12

CAMPAIGN DE PROMOTION POUR LE DÉPISTAGE VOLONTAIRE, ANONYME ET GRATUIT A LYON - FRANCE.
SHERBY Bruno, LLOYD M., LYVROUX M. & BAYROUXE J.L.
Médicine du Moede - Lyon, 69001, FRANCE.

L'association Médécine du Monde a réalisé à Lyon du 11 au 26 avril 1988, une campagne d'affichage publicitaire (sur 300 personnes multiples, 50 personnes commencent au 4-11) en plusieurs endroits de la ville, destinée à étudier pour promouvoir le dépistage volontaire, anonyme et gratuit. Le slogan retenu est "Le SIDA, ça se dépiste". Cette campagne a permis de connaître l'opinion d'une cinquantaine de personnes, public et privé, de la ville. Cette campagne consistait les jeunes répondant sur la dernière année laquelle une personne connaissant en sérologie (positive ou négative) est plus motivée pour respecter les mesures de prévention, par rapport à une personne en situation de doute. Dans les six semaines qui ont suivi la campagne d'affichage, 6 800 appels téléphoniques ont été reçus, la fréquentation moyenne de tous les centres a été multipliée par trois. Au cours des consultations de rendez de résultats et d'information, un questionnaire anonyme suggère était proposé aux patients. Le pourcentage de séropositifs dépistés pendant cette période a été plus faible que pendant les mois précédents (54%).

Session d'affichage Poster Session

Th.E.P.13

ANONYMITY BARRIER IN HIV ANTIBODY TESTING
Kochman, J., Harvey, B., and Ellis, James M.
University of Illinois Medical Center, Dept. of Psychiatry and
USCF AIDS Project, San Francisco, California, U.S.A.

Objective: To determine HIV antibody test site client preferences for confidential versus anonymous antibody testing across two collection points: 1987 and 1988.

Methods: In Study 1 (1987) and Study 2 (1988) 417 and 677 consecutive clients (respectively) from the San Francisco HIV Antibody Test Site were surveyed about their preferences for confidential versus anonymous testing prior to receiving their test results.

Results: Study 1. Of the 336 respondents completed of gay men, bisexual men, intravenous drug users (IVDU), and heterosexual contacts with multiple partners, 46% reported they would not have taken the test if anonymity were not guaranteed. An additional 30% said they were not sure whether they would be tested under confidential procedures. Bisexual, gay, and IVDU respondents were significantly more likely to express doubt about utilization of either the anonymous or confidential procedures (p<0.005). Also prior to notification, respondents and seropositive differed in their response to the question (p<0.05) with majority of positive (74%) testing and they were likely to be tested without a guarantee of anonymity. Study 2. Results (N=417) pertain to 1988 preferences for confidential versus anonymous testing. Comparisons across time points, gender, ethnicity, and age will be reported.

Conclusions: Based on 1987 data, the guarantee of anonymity in the testing process was an essential factor leading to utilization of the Antibody Test Site in San Francisco.

Th.E.P.15

PRELIMINARY EVALUATION OF AN ADMISSION, HIV ANTIBODY,
VOLUNTARY SCREENING PROGRAM IN A LARGE PRIVATE HOSPITAL.
Kochman, J., Harvey, B., and Ellis, James M.
The Methodist Hospital, Baylor College of Medicine, Houston, Texas, U.S.A.

Objective: To evaluate an admission, HIV antibody, voluntary screening program in a large (2300 beds), private hospital as to testing compliance, attitudes, positivity rate, cost and confidentiality.

Methods: Data were obtained from The Methodist Hospital (TMH) Infection Services, Virology Laboratory, and from individual patients' medical records. One hundred patients (50 who agreed to and 50 who refused testing) were interviewed.

Results: From 12/18/88 to 1/15/89 there were 3987 patients admitted to TMH: 2115 (53%) agreed to testing, there were 9 (43%) true +, 3 (15%) false +, and 3 (15%) indeterminate results. Of the 9 true +, 6 were admitted for proven or probable HIV-related disease, 1 of 9 patients was known to be in a high-risk category on admission. Informed consent for testing was obtained by admitting personnel, ward clerks, or nurses - seldomly by physicians. The most common reasons to agree to testing were "I wanted to know" (50%) and "I thought it was required" (28%). The most common reasons to refuse testing were "I was not at risk" (68%) and "I was previously tested" (16%). Of the 100 patients interviewed, 82% felt that this screening program was in their best interest and should be continued. Cost of testing was borne by patient insurance or by Medicare DRO payments. No problem with confidentiality was discerned.

Conclusions: An admission, HIV antibody, voluntary screening program can be implemented in a large private hospital with favorable patient opinion and at least moderate patient compliance. If greater patient testing compliance is desired, better education and physician-patient interaction is suggested. In this HIV+ risk population, it is difficult to show that universal admission screening adds to a practical approach to hospital infection control. Although previously unknown HIV+ patients were discovered, the majority could have been predicted by a history of risk factors and this is a significantly more cost-effective method of HIV screening.

Th.E.P.17

CARACTERISTIQUES DES CONSULTANTS D'UN CENTRE DE
DEPISTAGE ANONYME ET OBLIGATOIRE DE L'INFECTION PAR LE VIH,
MONTREAL
Munoz, R., Pilon, G., Charneau, A., Proulx, M., Gagnon, M., Salomon, R.,
Duchon, G., D'Amour, G., Gagnon, F., and Lacour, R.
Université Laval, Québec, Québec, Canada

Objectif: Une enquête a été effectuée pour étudier le profil de la population consultant le centre.
Méthodes: Un questionnaire anonyme est rempli pour chaque sujet, par un médecin, au cours de la consultation. Une prise de sang permet ensuite de pratiquer de manière confidentielle ou anonyme, le sérodiagnostic (dépendant par un test ELISA, et confirmation par un test Western-blot).

Résultats: Du 1^{er} Août au 31 Décembre 1988, sur ses 665 mes effectués, 29 étaient positifs (4,2%). Pour 85% des consultants, il s'agissait d'un premier dépistage. Le sexe ratio homme/femme (94/7) est de 13,1, sans trop de cas de femmes chez les moins de 20 ans (94%-2,1) et chez les plus de 20 ans (94%-11,1) (p<0,001). La tranche d'âge des 20-29 ans prédomine (51%), suivie de celle des 30-39 ans (25%). Les consultants sont le plus souvent célibataires (77%) et hétérosexuels (79%). Les homo-bissexuels utilisent plus souvent les préservatifs (55%) que les hétérosexuels (27%) (p<0,001). Les homosexuels qui résidentent 10% des sujets testés. Les principaux motifs de demande de dépistage sont par voie croisée, appartenance du partenaire actif à un groupe à risque (7%), appartenance du sujet testé à un groupe à risque (22%), soupçon personnel de saur relation sexuelle antérieure (42%). Dans 55% des cas, l'individu est patient à la confidentialité.

Conclusions: Le consultant teste le centre de dépistage d'un homme, jeune, célibataire, hétérosexuel, arrive en général des premiers secours non protégés, ne présentant pas d'autre comportement à risque, et consultant pour la première fois une sérologie par sérum personnel. Ce profil correspond à celui des patients consultant habituellement pour des infections sexuellement transmissibles.

Th.E.P.14

ASSESSING THE ETHICAL AND POLICY IMPLICATIONS OF TESTING
SURGICAL PATIENTS FOR HIV ANTIBODY IN THE USA
Coppola, L., Goss*
Wanderbilt University, Nashville, Tennessee, USA

Objective: To assess the ethical and policy implications of HIV antibody testing of USA surgical patients in the context of preventing occupational transmission of HIV in surgical settings.
Methods: 1) Review of data concerning: a) HIV occupational transmission in surgery, b) current status of HIV testing technology, and c) rationale advanced for antibody testing of surgical patients; 2) analyze the surgical health care worker and patient relationship regarding policy benefits and policy problems which may be generated by antibody testing in surgical settings.

Results: Review of data suggests that HIV occupational transmission is a non-zero risk, especially when U.S. Centers for Disease Control (USCDC) recommended precautions are routinely followed. The current status of HIV antibody testing technology and c) rationale advanced for antibody testing of surgical patients would generate more difficulties than benefits at the present time. It could also disrupt the normative ethics of the health care relationship and patient relationship. **Conclusions:** Mandatory HIV antibody testing for surgical patients in the USA is not recommended at this time. The routine offering of HIV antibody tests especially if clinically indicated is recommended. Such testing should address counseling needs and patient consent.

Th.E.P.16

EVOLUTION DES MOTIFS DE PRESCRIPTION DE SEROLOGIE VIH EN
MEDICINE GENERALE EN AQUITAINE, FRANCE, 1987-88
Maudou, S., Pommerehne, C., Vignat, C., Duba, F., Tilly, A., Blotman, J.,
Département d'Infectiologie Médicale, Université de Bordeaux II, Bordeaux, France

Objectif: Etude de l'évolution de la prescription de sérologie VIH par les médecins généralistes et des facteurs influençant cette prescription.

Méthodes: Un échantillon représentatif de surveillance épidémiologique par une médecine "sentinella" rapporte sur le région Aquitaine >2.700.000 habitants - à été mis en place en 1986. Depuis octobre 1987, 40 médecins généralistes transmettent des données concernant leurs prescriptions de sérologie VIH.
Résultats: En 15 mois, 566 sérologies VIH ont été prescrites, dont 20 (3,5%) ont été positives (confirmation par Western Blot). Le nombre moyen de prescriptions par médecin et par année a augmenté de 20% (de 0,41 en 1987 à 0,53 en 1988). Dans 40% des cas, le test est prescrit à la demande du patient, et dans 56% des cas à l'initiative du médecin. Ces proportions sont stables au cours du temps. Les demandes de sérologie concernent aussi bien les médecins (22%) que les femmes (68%). On retrouve dans 40% des prescriptions un comportement à risque pour l'infection par le VIH. Dans 10% des cas il s'agit d'hétérosexualité hétérosexuelle, associée ou non à une transaction, dans 3% des cas d'hétérosexualité ou autosexualité de transaction, et dans 25% des cas d'un contact avec des partenaires hétérosexuels multiples ou à risque. Pour 60% des prescriptions, les hommes et 147 femmes, aucun comportement à risque n'est identifiable à l'origine de la demande. Dans ce contexte, la prescription de sérologie à l'occasion d'un examen préopératoire pour 41% des hommes et 38% des femmes, ainsi qu'à l'occasion d'une grossesse pour 41% des femmes. Les seuls autres comportements à risque identifiables, des antécédents de maladies sexuellement transmissibles sont retrouvés dans 12% des cas; une proportion de 18% chez les hommes et de 7% chez les femmes.

Conclusions: La demande de sérologie VIH est presque généralisée libéralement augmentée régulièrement en Aquitaine. Toutefois la stabilité des proportions nous indique que des efforts ne sont pratiquement aucun comportement à risque. Dans ce cas, le médecin est souvent à l'origine de la demande que le patient. Les bilans préopératoires et pré-grossesse sont souvent à l'origine d'une prescription.

Th.E.P.18

CARACTERISTIQUES OF PATIENTS SUBMITTED TO HIV SEROLOGY IN A
CLINIC FOR SEXUALLY TRANSMITTED DISEASE OF DOWNTOWN MONTREAL
Lacour, R., Pilon, G., Charneau, A., Proulx, M., Gagnon, M., Salomon, R.,
Duchon, G., D'Amour, G., Gagnon, F., and Munoz, R.
Université Laval, Québec, Québec, Canada

Objectif: To describe the evolution in time of sex, age, sexual orientation, prevalence of HIV infection in patients submitted to HIV serology in an STD clinic of downtown Montreal. (Clinique L'Actuel)

Méthodes: Les caractéristiques de tous les patients qui ont subi une sérologie VIH ont été rétrospectivement revues; sérologie positive, age, sexe et sexual orientation were recorded.

Résultats: 1.709 patients were submitted to 3027 tests for HIV from November 1987 to December 1988. The global prevalence was 15.8% in this population. The mean age was 30.8 years. The following table presents the time trends:

Séropositivité	Prévalence	% d'hommes	% d'hétérosexuels
2/85	2,3%	10,0%	6,7%
1/87	1,1%	2,0%	10,0%
1/87	2,2%	13,3%	37,7%
2/87	10,2%	23,9%	54,3%
2/88	10,8%	22,9%	49,0%
2/88	10,4%	24,2%	48,8%

Conclusions: As expected, the prevalence of HIV infection in HIV tested individuals decreased at the same time that the proportions of women and of heterosexual individuals increased in that population. However, the increased prevalence noted in summer 2, 1988, might reflect a recent increase of heterosexual transmission in downtown Montreal. This observation has to be confirmed by additional data.

Th.E.P.19

ALTERATIONS SOCIO-ECONOMIQUES ET COMPORTEMENTALES DES PERSONNES INFECTÉES PAR HIV.

RENÉE, JACQUES, LÉVELLÉ, MARIE, E.M.M. et MORAIS DE SA, C.A.
Hôpital de la Clinique de la Santé - Orléans - FRANCE

OBJECTIF: Identifier les altérations socio-économiques et comportementales qui sont avec plusieurs Français dans les centres infectés par HIV.

MÉTHODE: L'étude a été réalisée en trois d'évalués les éléments que ont choisi deux des Promoteurs Sociaux de personnes HIV dans la direction de nous à distance, totalisant 100 personnes infectées.

RÉSULTATS: Les altérations plus fréquemment observées, ont été:

SOCIAL	N	%	ECONOMIQUES	N	%	COMPORTEMENTALES	N	%
Moins de 25 ans	170	100	Doucement	61	61	Changement de lieu d'habitation	25	25
Moins de 30 ans	170	100	Difficulté à trouver un logement	49	49	Prise de médicaments	25	25
Professionnels	170	100	Diminution des revenus	59	59	Prise de médicaments	25	25
Qualification	170	100	Changement de métier	59	59	Prise de médicaments	25	25
Discrimination	170	100	Manque d'argent	59	59	Prise de médicaments	25	25

CONCLUSION: Les altérations les plus observées sont à la question de la stigmatisation, de la peur et de la discrimination. Les personnes qui ont subi les autres altérations d'évaluation nous ont permis de traverser d'un accès programme d'éducation, et d'accéder à l'aide sociale, cette dernière puisse être interrompue.

Th.E.P.20

FUNK AND EPIDEMIOLOGY: VIRAL DIALECTICS IN THE SOUL MUSIC OF FUNK

HARRINGTON, Mark; BARR, D.; VASSOUR, R.J.; DANGLER, R.
AIDS Coalition to Unleash Power, New York NY, USA.

Objective: To elucidate the hitherto unexamined impact of the HIV epidemic as depicted in motifs of the seminal work of a major 1980's musician. **Methods:** Analytically listened to, read the lyrics of, danced to and attended concerts containing material from the album "O" THE TIMES and LOWESKY. **Discussion:** "In France, a skinny man died of a big disease with a little name. By chance his girlfriend came across a needle and soon she did the same." "Positively... Have U had your plus sign 2-day? Positivity. Do we mark U present or do we mark U later? ... Where did it come from? What did U have 2 dot? Can U mister? Conclusion: "Hold on 2 your soul, your plus sign 2-day." **Conclusion:** "Hold on 2 your soul, we've got a long way 2 go." [In concert:] "Cross the Line!"

Th.E.P.21

STUDY OF THE PREVALENCE IN A HIV TESTING CENTER

DEFORON, N.M.; MARCHAND-MERIEU, D. and BACHTEL, J.F. *Sandoz-Thalix, D.*
AIDS Reference Laboratory, Université de Liège, Belgium.

Objective: The AIDS Reference Center of the University of Liège has developed a program to evaluate the HIV seroprevalence in relation with motivations of consultants and actual risks of transmission.

Methods: A preliminary interview with the consultant is held with each team member and a confidential epidemiological survey form is filled. Seroprevalence is determined by classical serological methods (EIA, WB).

Results:	Motivation	Percentage	Evaluation of risk	Seroprevalence
to be reassured	multiple heterosexual relationships	44%	none	0%
	homosexual relationships	17%	±	0%
	IV drug users	3.5%	+	1%
	sexual relationship with seropositive professional risk	6%	+	1%
	others	16.5%	±	0%

Conclusion: In Belgium, the seroprevalence rate among blood donors is 2/100,000. In our AIDS Reference Center, this rate is 4/100 among people requiring a HIV test. The rate climbs to 1/9 in the population considered at risk.

Th.E.P.22

PREVALENCE OF ANTI-HIV ANTIBODIES IN PRINISITICE - SOMOGMA (507 PRINCE) - RWANDA

SOMBALES, V.L.C.-Des Anjos, R.M.P.-Gomes, M.C.C.-Ames, T.F.

Prevalence of anti HIV antibodies was investigated in 100 internal patients of CHUVIHO HOSPITAL DE SOMOGMA (507 PRINCE) (Institute of Infectious Diseases) recorded test, in a period going from May 12, to August 20, 1987. All patients were of male gender, their age varied from 16 to 36 years (median = age 36 years). 36% of them of white color and 64% single.

In the epidemiological examination realized later, to select persons with AIDS-risky behavior, we verified:

- 14% of the patients were homosexual or bisexual.
 - 88% of the patients had antecedents of sexual transmissible diseases.
 - 50% of the patients donated or received blood.
 - 28% of patients
 - 03% of the patients were using injectable drugs.
- 5 Seropositives (5%) were encountered, being minimum 23 and maximum 33 years old (median 28 years); four (4) of them were white and single. All presented a risk factor (one or more) for AIDS Virus infection: being 04 homosexuals or bisexuals (two of them were using injectable drugs) and 1 blood receptor, with a total of 2 transfusions.
- For the five (5) HIV (+) patients, one was blood donor, one has been jailed, and 3 admitted that they had transmissible sexual diseases, and in the medical examination, two of them had signals and symptoms related to AIDS.
- After leaving the infirmary, they were sent to health centers, near their houses, for attendance. Only one belonged to our district and died after presenting disseminated sarcoma appearing before AIDS, concomitantly after the diagnostic of the infection by HIV.

Th.E.P.23

PREGNANT ACCEPTABILITY OF HIV SCREENING AMONG

MOUST JAMER, (1), Le Galis C. (1), Pr Héarier R. (2) et Pr Papiernik E. (3)
(1) INSERM Research Unit 240, Paris, France. (2) Obstetrics and Gynecology Port-Royal, Paris, France. (3) Obstetrics and Gynecology Antoine Béclère, Clamart, France.

Since 1987, from HIV screening is systematically proposed, as their first prenatal visit, to all pregnant women attending 9 obstetrical clinics of public hospitals in Paris region (CIVU Census Data, December 1987 and January 1988, a questionnaire in written form was submitted, just before HIV screening proposal, to all women attending two of these clinics: response rate was 97% and 400 questionnaires were analyzed.

Respondents were significantly older (68% between 25 and 35 years of age) and had a higher level of education than the general population of pregnant women in the region (CIVU Census Data).

26-4% declared having already been tested for HIV (43.8% of these tests have been performed during ambulatory prenatal care), 63.7% knew, before attending clinics, about the risk of transmission of HIV from mother to fetus, 92.7% having learned about it through the media, 94.2% believed in such transmission during pregnancy, 29% during delivery, 11.1% through breast feeding, and only 2% by sucking care of child after birth.

20% supported systematic HIV screening proposal during pregnancy. 81% thought that female HIV carriers should reduce to pregnancy, and 80% supported abortion proposal for pregnant HIV carriers.

Among women already tested before attending clinic, 9.5% perceive themselves as being "more than average" at risk for HIV, among women not already tested but having previously thought about testing, 15.5% are in this category only 2.8% among others (p<0.01). It suggests an important effect of reassurance of testing. High acceptability of screening is also revealed by the fact that 70% were ready to financially participate in order to get access to testing.

Th.E.P.24

PSYCHOSOCIAL PREDICTORS OF HIV PEOPLE WHO FAIL TO RETURN FOR THEIR HIV TEST RESULTS

CALNIA, JUANJO; KEYLES, S.; COOPER, T.

University of California, San Francisco, Center for HIV Prevention Studies, U.S.A.

Objective: Although the majority of people who seek HIV antibody testing return for their results, a substantial minority fail to return. An understanding of the barriers to returning for test results is important to HIV prevention efforts that depend on people having knowledge of their HIV antibody status.

Methods: Data were collected from 997 individuals seeking HIV antibody testing at the anonymous test sites in California (98% volunteer rate). Respondents were assessed (self-administered questionnaires) when they came to have their blood drawn and reassessed when they returned for their test results two weeks later.

Results: Twenty-eight percent did not return for results (n=287). Relative to returnees, non-returnees were more likely to be of lower educational level, more anxious about contracting AIDS, less knowledgeable about HIV testing, and more likely to be young transfusion groups did not offer on sexual orientation, gender, race, age, marital status, reasons for seeking testing or knowledge of HIV transmission routes.

Conclusions: Efforts are needed to motivate young transfusion, and those with less education to obtain their test results; more on-site counseling to reduce anxiety and increase knowledge of test results may enhance return rates.

Th.EP.31 PRENATAL SCREENING FOR ANTIBODIES TO HIV-1 IN THE U.S. White, Harold, Patterson L., and the Perinatal HIV Screening Study Group, U.S.A.

Objective. To evaluate prenatal (PN) HIV screening in the United States.
Methods. 1) Surveyed all states to determine which had PN HIV legislation.
2) Compared number of marriages from 1/88-4/88 to similar months in previous two years to determine the impact of mandatory PN HIV screening laws in two states. 3) Conducted blinded HIV seroprevalence surveys of marriage license applicants (MLA) using routine PM syphilis serology specimens in 8 areas.
Results. PN HIV legislation has been proposed in 36 states. Mandatory PN screening (started 1/1/88) in Louisiana and Illinois resulted in 142 and 132 fewer marriages and repeat of the Louisiana law (7/88). Blinded surveys of MLA showed prevalence similar to military recruits (prevalence (PRA)).

Area	Rate	MLA % POS (8)	95% C.I.	MLA % POS* Adult ADPRA*
Alabama	11/87-07/88	0.65	0.11-1.00	130

Oshkosh	02/87-07/88	0.07	0.02-0.15	0.09

*Age- and sex-adjusted to prevalence per million population (317 years)
Conclusion. HIV antibody prevalence in MLA was as high as 0.64%. Mandatory PN screening resulted in fewer marriages in two states. Voluntary PN screening may be justified in high AIDS incidence areas.

Th.EP.32 THE EFFECT OF MANDATORY AIDS EDUCATION ON VOLUNTARY HIV TESTING IN PRISONS Addington, J., Fleming, D., Knaus, C., McAllister, M., Hoggan, J., Foster, L., *Center for Disease Control, Atlanta, Ga., U.S.A., *Mass Health Division, Portland, Ore., U.S.A., **State Department of Correction, Salem, Ore., U.S.A.

Objective. To assess whether mandatory interactive AIDS education leads to fewer at-risk inmates going to HIV testing and counseling.
Methods. We divided 1477 consecutively admitted inmates into two cohorts by date of admission: the first admitted 5/87-12/87 received only 10 minute videotape on AIDS (no-ED) and the second, admitted 1/88-2/88, received the videotape and a mandatory interactive session with an AIDS counselor (w-ED). All inmates were then offered HIV antibody (HIV AB) testing. HIV AB status for inmates declining testing was determined by testing serum routinely drawn for syphilis serology after personal identifiers had been removed. All were given a 20-item questionnaire (Q) on HIV risk (HCRAI). Results were linked to a questionnaire that assessed the inmate's history of risk behavior administered before admission to prison.

Results. Sixty three percent (927) of all the inmates were at risk for HIV infection defined as being positive for either HBsAg, IV drug use, and/or male homosexual. The cohorts were not different in their proportion of at-risk inmates (62.4% in the first and 63.6% in the second). Nineteen inmates were HIV AB positive (1.3%, 95% confidence limits (CI) 0.7%, 1.9%). Compared to at-risk inmates who did not receive interactive AIDS education, at-risk inmates who received interactive AIDS education were 23% less likely to refuse testing for HIV (79/264 vs. 192/661, p=0.03). IV drug users who received interactive education were 23% less likely to refuse testing than IV drug users who did not receive education (10/107 vs. 10/107, p=0.001). HIV AB testing was 67% less likely to refuse testing than HIV positive inmates who did not receive education (1/7 vs. 1/1).

Conclusion. Providing mandatory interactive AIDS education before offering HIV testing may result in fewer at-risk inmates refusing to be tested and counseled.

Anthropologie Anthropology

Th.EP.33 A REPORT ON A NEWLY DEVELOPED AIDS INTERVENTION PROGRAMME IN MONTRÉAL, QUÉBEC, CANADA

White, Harold, Patterson L., and the Perinatal HIV Screening Study Group, U.S.A.
CLSC Métro (Centre local de services communautaires), Montréal, Québec, Canada

Objective. To develop a comprehensive AIDS program for the population at high risk (HR) in Montreal, Quebec, Canada. HR is defined as those individuals who are sexually active, do not use condoms, and do not use the services of a counseling and medical support, with the objective to examine who, in the community at large, is using the services and to isolate the seroprevalence of this particular population. **Method:** Through a co-ordinated mandate by the Ministry of Health and Social Services and the CLSC Métro (Youth and Women's Clinic), the AIDS Intervention Centre was conceived. A staff of 4 counselors were hired to provide the necessary education and counseling component to this program. In-service education was provided for all support staff, both professional and non professional of CLSC Métro - Youth and Women's Clinic to assure consistency and sensitization. Telephone information, pre and post counseling, psycho-social support, follow-up and referral are provided to all beneficiaries of this program.

Results: Since the initiation of the program, we have tested (to date) 1387 individuals, which shows a seroprevalence rate of 5.4%. This seroprevalence rate is represented exclusively (100%) by the homosexual population.

Conclusion: This particular, comprehensive approach to H.I.V. testing is most commonly utilized by the "worried-well" population, but also reveals a seroprevalence rate consistent with the prevalence rate of homosexual population which is a targeted high-risk group.

Updated statistics available on day of conference.

Th.EP.34 SEXUALITY AND HIV TRANSMISSION IN KAGERA REGION, TANZANIA

White, Harold, Patterson L., and the Perinatal HIV Screening Study Group, U.S.A.
Dr. George E. Jaramba, Faculty of Medicine
P.O. Box 85018 Dar es Salaam Tanzania.

Kagera Region accounts for more than 60% of the total AIDS patients in Tanzania. A sero-survey based on healthy individuals in the area revealed prevalence rates ranging from 21% in urban areas to 10% in the rural area. Transmission of the infection is largely heterosexual. However, no study has ever been carried into the cultural factors governing sexual behaviours of the people in the area. This one year anthropological study is a contribution in that direction. It highlights on the cultural construction of sexuality among the people of Kagera with a view of devising appropriate control measures against AIDS pandemic in the area.

Th.EP.35 SEXUALITÉ ET CONNAISSANCE DE SIDA CHEZ LES LYCÉENS ET LES JEUNES FEMMES DE DAKAR ET BANZIEZ YOUSSEF M'BANGANI GUISSE ET LÉONARD D'ALMEIDA FILIPELA RP. SYSS DAKAR, SENEGAL

OBJECTIFS Les objectifs de cette enquête sur le SIDA visent à déterminer des groupes cibles d'éducation et de connaissance de la maladie, d'identifier les pratiques, habitudes et conduites culturelles autour de la sexualité, la contraception, les MST et le SIDA, participer à la conception de l'information, de participer à la conception et à la réalisation des actions de prévention du SIDA. Les groupes cibles sont ici des individus en activités sexuelles évidentes, des femmes fréquentant des cours de PNE, nombre de 400 en tout et des individus ayant déjà désiré d'activités sexuelles des lycéens (senne) de collèges à Dakar au nombre de 121.

MÉTHODOLOGIE Au questionnaire comprenant la 4 grande thèmes évoqués a été élaboré et complété par des interviews semi-directives individuelles et collectives.

RÉSULTATS: Les résultats de l'enquête montre que la sexualité du niveau de celle de la population cible est très libre; précocité, fréquence des rapports sexuelles, multiconjugalité, recherche de plaisir multiforme. Ceci avec des hommes en rapport avec le niveau d'instruction, la sexe. Utilisation relativement faible des préservatifs ainsi que le multipartenaire encore particulièrement évidente entre un niveau d'information grandissant et des hommes et pratiques sexuelles très peu contrôlées. **CONCLUSION:** L'enquête couvre des pistes pour analyser et créer des instruments d'information plus adaptés et plus conformes aux réalités sociologiques et culturelles.

Th.EP.36 THE ROLE OF HIV DRUG WITHDRAWAL SYMPTOMS AND SMOOTHS ACTIVATION IN AIDS RISK-REDUCTION

Margaret M. Connor, Spectra Systems, Inc., 155 6th St., Westboro, MA 01581 U.S.A.

Objective. To describe the experience of withdrawal within the social context of drug use and HIV-related risk activities. To determine the influence of withdrawal on the continuance of high-risk behavior.
Methods. A 20-item questionnaire was administered to 130 IV-drug using inmates at a methadone maintenance facility, a detoxification unit, and a drug-free residential facility. 152 of those surveyed were followed with a 10-month interview. Self-reported information was amplified with ethnographic observations "on the street."

Results. Interpreting the withdrawal experience in a context of drug use reveals as follows: recovery were complex than that elicited from a clinical diagnosis. The withdrawal experience affects an individual's ability to prevent AIDS transmission. 51% of those sampled who indicated that "it had come to mind that the person they were about to share a needle with might be HIV-infected" did not act on this thought in the form of prevention. Perceived withdrawal, sickness was a prominent reason for not taking preventative action.

Conclusion. Interpreting the withdrawal experience in its actual context can shed light on the meaning, experience and actions taken to alleviate symptoms of withdrawal and some of the barriers to integration of needle cleaning during needle sharing episodes. AIDS outreach education could prove more effective if, as part of the negotiation with active users to prevent needle-sharing practices, withdrawal symptoms were addressed as a problem area.

Th.E.P.43 RELIGION AS A TOOL IN PREVENTING THE SPREAD OF HIV IN UGANDA.

MUSABERI, Mohamed* Masaganda Florence**

*Health Educator, AIDS Control Programme, Uganda
**Nantrembe Christian Fellowship, Uganda.

Objective: To describe the success of using religion in preventing the spread of HIV in Uganda.

Methods: Focus groups and direct observation were used in several Christian Church groups in Uganda.
Interviews with AIDS patients were done.
Scientific analysis of information collected reveals how important christianity has been in preventing HIV spread especially in Urban areas.

Conclusion: Christian religion has had a significant impact in the prevention of AIDS in Uganda.

Th.E.P.44 HOW ORGANIZED RELIGION IMPACTS ON THE AIDS PANDEMIC IN PREVENTION, EDUCATION, AND PREJUDICE

Dr. Henry J. Zeiger, Memorial Hospital/Brno University, U.S.A.
The AIDS crisis in two areas: preventing or precluding discrimination against PWAs and those at risk for AIDS.

Methods: An analysis will be made of pertinent statements by prominent clerics ranging from the Pope through television evangelists. Major articles in the religious press will be analyzed. Secular publications will be examined for editorial opinions reflecting a religious influence.

Results: Analysis of pertinent materials shows a condemnation of the so called life styles of the groups at risk for AIDS. Many denominations express the attitude that "they" deserve what "they" get, thus contributing to preclusion for people with the syndrome and those at risk. This attitude has helped to slow governmental and medical responses to the AIDS pandemic, and added immeasurably to the attendant adverse social and economic suffering.

Furthermore, with their narrow, restrictive view of sex the same denominations have blocked efforts to teach safe sex, thus placing at grave risk all those outside of a strict, monogamous, heterosexual marriage.

Conclusion: By not adopting a truly Christian response to those with AIDS, organized religion encourages judgemental, condemnatory reactions, actually exacerbating the adverse medical, social and economic effects of the epidemic.

Sociologie du SIDA Sociology of AIDS

Th.E.P.45 REVELATION OF VOLUNTEERS FOR CONTROL OF THE HIV EPIDEMIC

CHANG, Chien-Ji University of South Florida, Tampa, Florida

A review of US efforts to control epidemics between 1941 and WWII reveals that education, a partially effective drug (arsphenamine), case finding, contact tracing and free treatment were the major control measures. Mass media recruitment, identification followed by involvement in a long treatment program (18 months with arsphenamine) modified behavior sufficiently so that further spread was significantly reduced. We must identify the 1.5 million Americans infected with HIV and embrace them in a social-medical program which will so alter their behavior that transmission of HIV will be significantly reduced. This can best be accomplished by emulating the "buddy" system of San Francisco except that the buddy begins to care for and to advocate for the HIV seropositive person as soon as that person is identified and long before that person is ill, with wary identification there will be several years available for behavior modification through the social-medical-buddy involvement before the HIV positive person becomes highly infectious. By that time the evidence should have been so effective that further transmission rarely occurs. The only practical way to mobilize large numbers of long term dedicated volunteer "buddies" is through the churches. The Christian Church grew explosively from the 2nd to the 4th centuries AD as the Christian cared for the victims of the smallpox and measles epidemics which struck Rome beginning in 165 AD while decessions of the State Religion fled from the ill. Such fearless demonstration by Christians of faith in God and of God's love in the face of terrifying disease attracted an enormous following. We must rekindle Christians of their heritage and convince them to take up this historic and critical role. Such a buddy program combined with widespread testing, contact tracing and free treatment can control HIV in our society.

Th.E.P.47 WHERE ARE PEOPLE IN ENGLAND & WALES DYING FROM AIDS?

Kennedy Ann R.; Eilan G.A.; Porter J.D.W.H.;
PHLS Communicable Disease Surveillance Centre, U.K.

Objectives: To determine 1) Where people with AIDS (PWA) are dying in hospital, at home or hospice; 2) Whether their cause of death was related to where they die and whether these factors are changing with time.

Method: All PWA reported to the Communicable Disease Surveillance Centre by December 1988, were reviewed to ascertain those who had died and on whom there was a matched death entry. Demographic data and cause and place of death information were also collected.

Results: By the end of 1987, 1243 PWA had been diagnosed of whom 362 had matching death entry data. Of these 302 (83.4%) died in hospital, 55(15.2%) at home, and 5(1.4%) in hospice. Of the 60 PWA who died outside hospital, 58 were men, 2 were women, 435 (38/65) were aged 30-40 years; 125 (32/28) of homosexual/bisexual men died in the community compared with 92 (12/11) of injecting drug users and 85 (32/8) of haemophiliacs. Preliminary data for 1988, albeit incomplete, confirms that place of death is changing. Data on cause of death related to place of death will be presented.

Conclusion: National surveillance data has an important role to play in understanding patterns of "terminal" care, which have previously not been recognized and which are of value in highlighting important resource implications.

Th.E.P.46 COMPORTAMENT RELATIU AL SIDA ÎN VILIA DE BUCUREȘTI ÎN TRIMESTRII ÎNCEPUTURII ANULUI 1990

MIHAI, TUDOR Institut de Statistică și Informatică în Medicină, București, România

*Universitatea de Științe și Medicină din București, România; **Fundația Științelor Științelor, Arad, România; ***Institutul de Statistică și Informatică în Medicină, București, România

Obiectiv: Să se prezinte rezultatele unei studii asupra comportamentului sexual în viziunea medicilor din cadrul serviciilor de urgență și de ambulanță în București în perioada 1989-1990.

Metode: S-a realizat o analiză retrospectivă a 100 de cazuri de SIDA în viziunea medicilor din cadrul serviciilor de urgență și de ambulanță în București în perioada 1989-1990. S-a realizat o analiză retrospectivă a 100 de cazuri de SIDA în viziunea medicilor din cadrul serviciilor de urgență și de ambulanță în București în perioada 1989-1990. S-a realizat o analiză retrospectivă a 100 de cazuri de SIDA în viziunea medicilor din cadrul serviciilor de urgență și de ambulanță în București în perioada 1989-1990.

Rezultate: În urma analizei s-a constatat că majoritatea pacienților cu SIDA au fost diagnosticați în viziunea medicilor din cadrul serviciilor de urgență și de ambulanță în București în perioada 1989-1990. S-a constatat că majoritatea pacienților cu SIDA au fost diagnosticați în viziunea medicilor din cadrul serviciilor de urgență și de ambulanță în București în perioada 1989-1990. S-a constatat că majoritatea pacienților cu SIDA au fost diagnosticați în viziunea medicilor din cadrul serviciilor de urgență și de ambulanță în București în perioada 1989-1990.

Concluzii: SIDA este o boală care se transmite prin contact sexual, prin transfuzii de sânge și prin utilizarea de seringi contaminate. Este important să se realizeze o educație de sănătate pentru a preveni răspândirea bolii.

Th.E.P.48 MATRIÈRE DE RISICU ȘI SIDA ÎNtre ÎNTERVENȚIILE SIDA

MIHAI, TUDOR Institut de Statistică și Informatică în Medicină, București, România

Th.E.P.55 AIDS IN AN AGING SOCIETY: ETHICAL AND PSYCHOLOGICAL CONSIDERATIONS

Schmidt, Robert M.* and Kanan R.B.** *Center for Preventive Medicine and Health Research, San Francisco State University and Pacific Presbyterian Medical Center, San Francisco, California. **Department of Sociology/Antropology, Trenton State College, Trenton, New Jersey, U.S.A.

Objective: To analyze ethical and psychosocial issues of AIDS in an aging society. **Methods:** Health care services and health research funding agencies have not acknowledged similarities between needs of America's aging population and the estimated 1.3 million Americans infected with HIV. Knowledge of individual variation of susceptibility to HIV infection, latency of HIV disease progression, HIV infection of the central nervous system, and lifelike HIV infection in currently asymptomatic individuals is especially applicable to older people. Ethical and psychosocial issues are similar; e.g., aging, homophobia, racism, loss of self-esteem, insurance coverage, access to health benefits and services. **Results:** Currently, 10% of AIDS patients are age 50 years of age; 25% of those are 60 and 4% are 70 years of age. In Europe, 11% of AIDS cases have been reported in persons 50-62 of these are 60 years of age. Ethical issues for persons with health care progress and age of receiving retirement benefits include stigmatization, erratic access to health services, age of qualifying for federal health care programs and age of qualifying for retirement benefits. **Conclusions:** Ethical and psychosocial effects on the older individual with AIDS and the impact of the epidemic on the elderly as a group would benefit from comparative analysis. We suggest appropriate societal responses to the AIDS pandemic and a rapid aging population in Western countries provide a paradigm for health care services and research in the United States.

Th.E.P.57 GUARDIANSHIP STATUS AND SUPPORTIVE RELATIONSHIPS AS CO-DETERMINANTS OF ENROLLMENT OF HIV-POSITIVE CHILDREN IN A PLACEBO-CONTROLLED STUDY

Steinberg, Katherine*; Calwell, T.*; Kambhni, J.*; Hillyough, A.*; Hertzstein, L.* and Subintstein, A.* *Albert Einstein College of Medicine, Bronx, New York. **National Institute of Child Health and Development, Bethesda, Maryland.

Objective: To identify psychosocial factors influencing enrollment of asymptomatic and mildly symptomatic HIV-positive children in a double-blind placebo-controlled intravenous gamma globulin study. **Methods:** Eligibility criteria: non-hemophiliac children under 13 years with CDC Classification P-3a, P-3c (not hypoxic), P-2b, T-2f. Consenting and refusing caregivers were compared re: guardianship and socioeconomic status. Supportive contacts prior to consent or refusal were enumerated. **Results:** Of 38 children eligible, consent for treatment was given for 13.

Guardianship	Consent Given	Consent Withheld	More than 1 prior supportive contact
biologic parent	9 (24%)	6 (18%)	with 9 (69%) consent-adoptive parent
adoptive parent	2 (5%)	1 (3%)	with 9 (69%) consent-
other family member	2 (5%)	4 (11%)	ing caregivers and with 2 (18%) withheld-
father care agency	14 (37%)	14 (37%)	ing.
TOTAL:	13 (34%)	25 (64%)	

 No socioeconomic difference noted between the 2 groups of caregivers. **Conclusions:** Biologic and adoptive parents are most likely to consent to the blinded treatment trial. Other family members are more likely to refuse consent while father agencies are the most reluctant. A supportive relationship with caregivers can positively influence study enrollment.

Th.E.P.59 CHANGES IN SEXUAL BEHAVIOR OF A COHORT OF FEMALE HEALTH CARE WORKERS DURING THE AIDS ERA

Cherry, J.* and DEPTERBERG, P.* *Medical Center, Los Angeles, California, U.S.A. *University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, U.S.A.

Objective: To determine whether health care workers (HCWs) in a university hospital with AIDS patients altered their sexual behavior from 1984 to 1987. **Methods:** As part of a prospective study on assessing the risk of occupational HIV infection, 116 female HCWs at UCLA Medical Center (Los Angeles) were enrolled in 1984 and completed follow-up 3 years later. At each visit HCWs responded to questions including demographic and sexual practices (sexual preference, number of sexual partners/year and number of sexual contacts/month). **Results:** Four sexual partners in 1987 were reported by 23 of 105 respondents whereas 73 had approximately the same number and 10 had more partners (p=02 for fewer partners). Those workers sexually active in 1984 (n=70) decreased their activity by 1.6 contacts per month in 1987 (mean \pm SD: 7.4 \pm 8.6 (1984) vs 5.8 \pm 5.6 (1987), p=.04). Fourteen of 100 HCWs changed sexual preference from male to female (n=5) or male to no sexual partners (n=12) during the 3 years (p=.04 for less male sexual contacts). **Conclusions:** After 3 years of follow-up female HCWs in a large university hospital in Los Angeles reported fewer sexual partners, fewer sexual contacts and less heterosexual activity, this may reflect an increased awareness of risk factors for community-acquired HIV infection.

Th.E.P.56 HEALTH PROFESSIONALS' VIEWS OF SOCIAL DISTANCE FROM PERSONS WITH AIDS AND OTHER CONDITIONS

Cohen, Melissa L.*; Muder, T.* *University of Illinois College of Nursing, Chicago, Illinois, United States.

Objectives: To determine the social distance health professionals feel comfortable putting between themselves and persons with AIDS or other conditions. To determine whether differences in social distance were perceived for persons in various AIDS transmission categories. **Methods:** The pretested instrument was developed using a modified social distance scale after the work of Bogardus and Gentry. It was distributed randomly to nurses, pharmacists, lab technicians and others at two large hospitals, one in a high AIDS prevalence area and one in a lower AIDS prevalence area in a midwestern state. 425 subjects received questionnaires, 219 responses were received for a response rate of 51.5%. **Results:** Respondents perceived the most social distance between themselves and persons with conditions that could be said to be under the voluntary behavioral control of the affected person such as drug resistance, sero-conversion, alcoholic, promiscuous persons, homosexuals, etc.; however, persons with AIDS from unknown sources had more than were virtually equal to homosexuals and bisexuals. No statistically significant differences were detected between those respondents in high/low prevalence areas. **Conclusions:** Those with HIV infection in AIDS or between AIDS and families. White respondents were willing to allow a closer social distance for all disease conditions and AIDS transmission categories except for IVDA's than were non-white respondents. **Conclusions:** Will be reported based on results.

Th.E.P.58 PERINATAL STUDY COMPLIANCE OF HIV-INFECTED WOMEN: SIGNIFICANCE OF RISK FACTORS AS A DETERMINANT

Douglas, Cecilie*; Cabot, T.*; Burt, C.*; Calwell, T.*; Robinson, J.*; Hillough, A.* *Albert Einstein College of Medicine, Bronx, New York. **National Institute for Child and Human Development, Bethesda, Maryland, U.S.A.

Objective: To determine whether specific risk factors influence compliance of HIV-infected women in a Prospective Perinatal Transmission Study. **Methods:** Of 80 women at risk for HIV infection enrolled in a perinatal HIV transmission study over a 3 year period, 45 (56.8%) were HIV-infected at entry, 60 (22/36) carried to term. Risk factors were determined by a structured questionnaire and counseling. They were categorized into 2 primary strata: (1) Past or current intravenous drug use (IVDU), (2) Heterosexual contact with high risk partners. Compliance was defined by the patients' attending drug use, post-partum visits within 6 months of delivery. **Results:** Of the 36 HIV-infected women, 61% (22/36) had histories of intravenous drug use; 39% (14/36) were infected as the result of sexual contact with an HIV-infected partner. 11% (10/94) completed the IVDU, the 14 women infected heterosexually, 11% (10/94) completed. In all cases, aggressive interventions and follow-up methods were employed. **Conclusions:** No significant differences in compliance between the 2 groups was observed. Aggressive interventions and follow-up may normalize differences between the 2 groups.

Th.E.P.60 SOCIAL ASPECTS OF AIDS: AN ANALYSIS OF ATTITUDES AND BEHAVIORS

Dr. Subintstein, A. and P.R. Subintstein, M.D.* *Medical Center, Los Angeles, California, U.S.A. **National Institute of Child Health and Development, Bethesda, Maryland, U.S.A. **Dept. of Medicine, National Medical College, Madras, India.

AIDS in the epidemic of economic, social, political, individual reactions and responses to HIV infection and AIDS. This epidemic of social distance is also viewed a global phenomenon. A public awareness about AIDS grows, as the number of HIV-infected persons and the number of AIDS cases rises steeply during next five years. The impact of AIDS and HIV infection on social and economic development may be critical. The present study is an attempt to analyze the attitudes and responses of AIDS epidemic in the help of perception theories and tools of behavioral analysis, on the origin and prevention of the disease, medical care, public sentiments among AIDS and other sero-negative individuals and psychological attitudes such as guilt, anxiety and depression and stressful reactions. The analysis of findings revealed that the people felt the need for useful therapies and they perceived that the most effective therapy begins to be a sense of well-being born out of a positive attitude towards life. Among urban population AIDS has caused a deep concern in the individual as well as a society whereas in rural areas the awareness of this new disease is negligible or not at all even reached. Among rural population the awareness on the prevalence of local diseases are found to be higher than AIDS. Still a higher percentage of population have no knowledge about the origin. Based on the findings it is felt essential that priority should be heavily laid to mass tv media programs in both urban and rural areas as the most necessary public health measures.

Th.E.P.61 OUR LADY OF AIDS: THE TALISMANIC DESIGN OF
SAUND DURAND'S PLAYS FROM "VOICIVE OFFERING"
Miller, James (Professor),
University of Western Ontario, London, Canada.

In 1987 London-based Canadian artist André Durand depicted the Princess of Heaven, the healer Touching American Pua Sunmye Sherman in "Voicive Offering," a large (8'x 12') oil painting in Renaissance style displayed in several British Churches in 1988. The icon includes portraits of saints traditionally associated with plagues and healing miracles (George, Sebastian, Catherine of Genoa) as well as images of doctors, nurses, and gay male PWAs.

Objective: To account for the survival of Renaissance plague iconography in the Age of AIDS; to discuss the healing function of "Voicive Offering" as a magical talisman and to consider the implications of Durand's iconography as a representation of PWAs as martyrs.

Method: A Renaissance iconological approach to Durand's imagery will be adopted to reveal its origins in Florentine theatre (Neoplatonic magic). Slides will be shown.

Conclusions: Western/medical notions of healing tend to flourish during plague-times when faith in the power of the medical and political establishments wanes. Durand's arcane art of healing is comparable to modern 'imaging' therapy.

Th.E.P.63 PRIVATE/PUBLIC SECTOR COOPERATION IN AIDS
EDUCATION

Donner, Ann; C. Bishop; Hillard, P.; Grant, C.;
University of Washington, Seattle, WA, USA; SAFECO
Insurance Companies; Seattle Public Schools; Plays for
Living, New York City, U.S.A.

SAFECO Insurance Companies, based in Seattle, awarded a grant to Plays for Living in early 1988 to develop an AIDS education play for students in Seattle Public Schools. Plays for Living, a New York-based organization with a Seattle office, hired a playwright, Bruce Peyton, to develop the play with a panel of local educators and SAFECO representatives. Like *Life* is a 30-minute dramatic play performed by young professional actors. The performance is the "first act" of the prevention effort. The "second act" occurs when students return to classrooms to discuss the play with trained volunteers using a study guide created for this purpose. The play was performed for 6,300 students (11-14 years) during the 1988/89 school year. The use of live theater was a powerful medium for AIDS education and the involvement of SAFECO increased the perceived legitimacy of the project, contributing to its success. Evaluative comments from students, a description of the play and its development, and recommendations for working with private sector companies will be presented.

Th.E.P.65 THE RURAL THEATRE PROJECT: AIDS EDUCATION IN THE VILLAGES
OF TRINIDAD

Neilson, Michael; Nelly, C.; Jan, R.; Almodi, C.;
AIDS/COM, Washington, D.C.; AIDS Educators, Trinidad and Tobago; New
York, USA; Trinidad and Tobago Red Cross Society; AIDS/COM, Washington, D.C.

Objective: To reach rural populations with an entertaining and educational theatre production that encourages discussion of AIDS prevention and the impact of AIDS on the community. To evaluate the effectiveness of the production and the impact on other Caribbean regions.

Method: An international collaboration developed and financed a communications research project to reach rural communities in Trinidad and Tobago with a popular theatre production that examined the impact of AIDS on a family in which a son who is bisexual contracts and dies of AIDS. A promotional campaign preceded the theatre presentation, an AIDS educator led group following the presentation. Written materials and condoms were distributed and the audiences completed evaluation forms.

Results: More than 700 people in 30 villages viewed the dramatic production during a five week period all located on sites in additional AIDS educational presentations, both in dramatic and written form. Most questioned the meaning of the "AIDS test" and how to avoid AIDS.

Conclusion: AIDS education via popular arts is well-received. This channel provides information in a friendly, non-threatening manner and encourages community discussion of AIDS. Theatre can help Caribbean populations address controversial subjects such as death, sexuality, and modern family life.

Th.E.P.62 Back to Basics/Use of Popular Theatre in AIDS Awareness
Campaigns

Spaulding,
Director of Fieldwork, School of Social Work, University of
Zimbabwe, P.O. Box 66022, Harare,
Harare, Zimbabwe.

Objective: To show how popular theatre can be used effectively as a tool in the AIDS awareness campaign.

Method: The paper seeks to show how popular theatre groups have been used in the campaign against AIDS in Zimbabwe. It examines some of the problems that have been encountered in using popular theatre and indeed what successes have been achieved. The main focus is on the achievements of a theatre group sponsored by a non-governmental organisation called AIDS Counselling Trust (ACT) which the author has been involved with. However, work by other theatre groups is also reviewed.

Results: The paper tries to show that although various approaches have been employed by various organisations to spread the message on AIDS, the message, it would appear, has not fallen on deaf ears. The majority of the people have started to take heed of the warning and change their sex and other habits. This paper argues that the conventional information dissemination methods and tools are often ineffective due to problems of inaccessibility (eg TV, radio, newspapers etc) for the majority of the population, and at times the practical inaccessibility of these media. There is therefore a need to develop fresh and more effective strategies for the campaign. **Conclusion:** In the light of the afore-mentioned problems, some organisations have gone 'back to basics' and introduced popular theatre as the latest weapon in the AIDS awareness drive - with a considerable degree of success.

Th.E.P.64 1989 PARTNERSHIP IN Caring CAREGIVER
CALENDAR

Kochman, Diane A.; Reister, C.; Health Resources and
Services Administration, Public Health Service, Department
of Health and Human Services, Rockville, Maryland, U.S.A.

Objective: A calendar was conceptualized as a visual expression of the message that AIDS is a human health problem worthy of a broad, societal caring response. Its purpose is to promote a partnership of community resources in providing such a caring response. This message was conveyed in a way which balanced hope and reality, and activated viewers, especially the uninformed, to engender a caring attitude and positive response.

Method: Collaboration with major AIDS organizations. Choice of a title which reflects the theme which is reinforced in the text. Each month focused on how different segments of society are responding. Illustrations were commissioned which symbolically and dramatically underscore the human dimension of AIDS and which move beyond stereotypes. Characters were selected from "heroes" in history to reinforce the visual images. Concrete examples of caring responses were developed, and a directory of national and local resources was included. **Results:** The enclosed 1989 calendar has been enthusiastically and practically received. It is being used in medical offices and facilities, in work places, in local state and federal government facilities, in religious organizations, and as a training tool to emphasize a multidisciplinary, "partnership" approach to AIDS care. **Conclusion:** The calendar will be considered for continuation in 1990, potentially as a handbook, and as a vehicle for involvement of the arts in the AIDS epidemic.

Th.E.P.66 PHYSICIAN-PATIENT RELATIONSHIPS IN AIDS DRAMAS
Bakajina, Genev' and Bhatia, R.C.

Johns Hopkins University School of Medicine,
Baltimore, Maryland, USA; Mount Sinai School of Medicine,
New York, New York, USA.

In the spring of 1985 two plays about AIDS, *As Is* by William Hoffman, and *The Normal Heart* by Larry Kramer, opened in New York City. The physician-patient relationships they depict provide insight into how people with AIDS and their friends perceive doctors and understand their relationships. Five nameless physicians function as shadowy, background figures who are unapproachable. They are perceived as expensive, insensitive, and ignorant. At the end of the play when the main character, Rich, is hospitalized with AIDS, a nurse and a janitor interact with him, and physician contact is noticeably absent.

In contrast to *As Is*, *The Normal Heart* portrays a physician, Dr. Ross Brooker, as an emotionally involved caregiver. She is politically aware and empathetic. She symbolizes everybody's vulnerability to disease because she is a victim of polio, who is confined to a wheelchair. In one scene she tells Felix, a major character, about his AIDS diagnosis. In another, she holds him as he dies.

By analyzing these two plays, one may appreciate the contrast between the special closeness Dr. Brooker and Felix share and the distance separating Rich and his doctors.

Le SIDA, la société et le comportement AIDS, Society and Behaviour

La communauté (partie 2) Community (Part 2)

Th.E.P.67 THE FUNDACION SIDA DE PUERTO RICO EXPERIENCE
SOSD, Doracalberto, EN(C) A. Rodriguez, MS**
A. Nigallioni, MS(C) A. Menaux, MS** Fundacion
Sida de Puerto Rico, 251 University of Puerto Rico, San Juan,
Puerto Rico, U.S.A.

OBJECTIVES: To describe demographic, social and clinical characteristics of persons receiving services.
METHODS: Fundacion SIDA de Puerto Rico was established in 1983 as a volunteer community organization to provide services to persons with HIV infection, their families and significant others. Clients received services in four areas: prevention and education, emotional/practical support, financial aid and advocacy. We reviewed 182 records of clients seen from Oct. 1987 to Jan. 1989 (51% of consultative records).

RESULTS: There were 130 males (71%) and 52 females (29%) seeking services. The majority (53%) were in the age range of 30-39 yrs. Risk factor was known for 156 persons (86%) were homosexual and 76% were either IVDU's or their partners. PWA's accounted for 70%. PWAC 6% and asymptomatic HIV+ 24%. Most persons (91%) were from low socioeconomic background including some imprisoned (2%) and others homeless (6%). A large proportion (41 of 182) showed migration patterns with mainland USA. Close to half (48%) required direct financial aid, as well as emotional support (49%), and advocacy (28%).

CONCLUSION: Persons seeking aid from this community based service organization needed a wide variety of services. Long range goals of similar organizations should include these.

Th.E.P.68 Le Comité sida aide Montréal et ses activités

Langue Française

Directeur/Président générale du CSAM, M.V. (ada), M.A.P. Montréal, QC, Canada.

Le Comité sida aide Montréal fut mis sur pied en septembre 1985, par des intervenants de différents milieux. Depuis sa fondation, le Comité sida aide Montréal n'a cessé de progresser et d'améliorer ses services. Le CSAM est devenu par ses activités un organisme non-gouvernemental complémentaire du réseau de la santé et des services sociaux de la province, particulièrement à Montréal.

Avec l'expertise accumulée, les représentants du CSAM sont souvent appelés à travailler comme consultants dans divers endroits œuvrant dans la lutte contre le sida.

Les objectifs du Comité sida aide Montréal sont d'assurer le support aux personnes atteintes et à leurs proches, d'aider les personnes séropositives et leurs familles et amis; de prévenir et de sensibiliser le public sur la question du sida, sur la manière de se protéger, aider certaines populations dans ses comportements à risque, le CSAM intervient auprès des hautes instances afin que les décideurs aient toutes les informations nécessaires pour mettre de l'avant une politique d'aide et de prévention.

Th.E.P.69 HIV RELATED SERVICES MODEL FOR COMMUNITY SERVICE PROVISION
Rosen, Deborah M., D.,
New York State Department of Health, AIDS Institute,
New York, NY, U.S.A.

Objective: To describe a model for HIV-related community services which include outreach, community education and support services for persons with HIV infection, their partners and families.

Methods: Services are developed thru contracts with not-for-profit organizations throughout New York State. State initiatives are generated on the local level with input from community leaders, local health and human service providers to effectively respond to needs of specific regions/communities. This public/private partnership is strengthened as programs expand and become self-sustaining. The model is based on coordination with other community-based organizations and health and human services systems. Results: Since 1983, 16 community service programs (CSVs) have been developed through the State. Programs are located in urban areas to provide services to a regionally diverse area and hard-to-reach populations are served through volunteer task forces, satellite offices and staff stationed in home service settings.

Conclusions: Advantages of developing regional not-for-profit programs: greater flexibility in designing strategies for HIV prevention and support services which are responsive to regional needs; CSVs play a significant role in HIV related service delivery through identifying needs/gaps in services and coordinating provider resources to fill those gaps. The effectiveness of other health and human services in response to HIV is maintained through coordinating providers, thereby ensuring direct needs are met in an efficient and expeditious manner.

Th.E.P.71 LONDON LIGHTHOUSE - A CONTINUUM OF CARE
C. B. MacGregor, S. Halach, Dr S. Mansfield*,
D. O'Brien*, M. Pipes* et al.
*Management Team, London Lighthouse, London, UK.

Objective: To describe a unique model of care for people with HIV, ARC and AIDS in the London area which is of potential value in all health care planning strategies.

Method: The description of London Lighthouse, a community project, offers a continuum of care for people with HIV. This project has principles of love, respect and non-judgement in the UK. The centre's services are based as defined by people with the virus and on principles of love, respect and non-judgement. The centre's services are based on the London Lighthouse has grown in 3 years to become one of the largest AIDS voluntary organizations in the UK. The centre's services comprise the work of voluntary and statutory agencies. Care and emotional support are provided both in the home and within the centre, by means of counselling, training, health programmes and residential nursing care.

Conclusion: This basic model of integrated and continuous care can be incorporated into planning strategies for other local, national and international projects and could have far reaching consequences not only for people with HIV but also for other types of health care.

Th.E.P.70 CONTRIBUTIONS OF THE INTERNATIONAL GAY COMMUNITY TO AIDS RESEARCH

Falk, Lawrence A., Jr., Verick, W.A., et al. Committee for A Nobel Endeavor, Chicago, Illinois, USA

AIDS was first recognized within the gay community and since then other at-risk groups have been identified. Although the threat of AIDS is world-wide, particularly in developing African nations, early recognition of high density AIDS cases within the gay community provided scientists with a cooperative group of individuals, yielding numerous clinical specimens and essential information on probable transmission modes. The international gay community has played an essential role in advances of knowledge concerning AIDS:

1. Isolations of putative etiologic agent; lymphadenopathy associated virus (LAV), human T-lymphotropic virus type-III (HTLV-III) and AIDS associated virus (ADV), collectively classified as human immunodeficiency virus (HIV) were made from clinical specimens obtained from gay men.
2. In blood samples from gay men expedited development of blood screening assays which have reduced significantly transfusion-associated AIDS.
3. Provided the medical/scientific community with innumerable clinical specimens for immunologic and virologic studies.
4. Participated in clinical studies for safety and efficacy evaluation of potential therapeutic agents.

5. Developed and implemented educational and safe sex programs that have served as models for programs presently in place for other at-risk groups. These contributions of the international gay community will be summarized and reviewed and compared with initial advances in hepatitis B research and vaccine development.

Th.E.P.72 CREER UN MILIEU DE VIE: UNE APPROCHE ARCHITECTURALE NOVATRICE

Séguin, Gilles*, Morisset, R.** Gauthoin, J.***
*Commissariat Régional d'Hygiène, *Hôpital-Dieu de Montréal,
**Atelier Habitat/Urbanisme, Montréal, QC, Canada

OBJECTIF: créer un milieu de vie pour les personnes atteintes qui soit adapté à leurs besoins.

Méthode: le projet a été élaboré par une équipe multidisciplinaire composée de professionnels architectes, administrateurs, personnes atteintes, les individus dans l'intervention auprès des personnes atteintes ou ayant développé un projet similaire en fonction d'autres pathologies. Les différents étages de la maladie et les besoins spécifiques y étant reliés ont été cernés. Le type et le qualité de l'intervention ainsi que les besoins des intervenants ont été clairement établis.

RÉSULTATS: Le choix du site et le concept architectural qui réunit une rénovation sur un bâtiment ancien à une construction neuve témoignent d'une préoccupation majeure de créer un milieu de vie répondant aux différents besoins des personnes atteintes: cadre de vie familial, encadrement dans la communauté, vie communautaire, soins et soutien à la vie quotidienne, connaissance, sécurité et insécurité, silence-neuillisme vs communication-expression, présence continue, soins et soutien à la vie autonome, encadrement médical léger, activités récréatives et artistiques.

CONCLUSION: Un concept architectural polyvalent pour recevoir 11 personnes atteintes, 13 soins répartis par modules en fonction des besoins des intervenants ont été permis de répondre à un mixité de clientèle à différents stades de la maladie.

Éducation (partie 3) Education (Part 3)

Th.E.P.73 THE STOP/AIDS MODEL FOR COMMUNITY CHANGE: ACCEPTABILITY IN A LOW-INCIDENCE AREA FOR AIDS
Baker, Cedric M. Ross, T. J.
New York State AIDS Institute; Albany NY, USA

Objectives: To pilot a San Francisco-based risk reduction model in a low-incidence area for AIDS.

Method: The STOP/AIDS model, which uses the peer-led group meeting as a forum for education and support, appears to have been effective in changing sexual norms in the San Francisco gay community. Gay/bisexual volunteers from a GDU-funded AIDS prevention study were trained in a 20-hour seminar to implement the model in an area where seroprevalence is believed to be low. The trained volunteers recruited STOP/AIDS meeting participants through targeted outreach to gay bars, social networks and the prevention study cohort.

Results: During October through December 1988, 260 gay and bisexual men agreed at outreach activities to be contacted for participation in a local STOP/AIDS meeting. At recruitment, 188 men were scheduled for one of 14 meetings; 86 men (46%) actually attended their scheduled meeting.

Fifty-five meeting participants (63%) expressed interest in becoming STOP/AIDS project volunteers. Attrition rates are comparable to those reported for New York City and San Francisco.

Conclusions: The acceptability of STOP/AIDS at this pilot site suggests that the model may be exported to communities outside the AIDS epicenters. Even where seroprevalence is low, the need for information, emotional support and social action may be high. Studies are now needed to evaluate the effectiveness of the model in motivating sustained behavioral change.

Th.E.P.75 RESOURCES FOR EDUCATING ABOUT MARRIED HOMOSEXUAL AND BISEXUAL MEN - A FACILITATOR'S KIT IN ACTION
Moloney, John W. Education and Liaison Officer
Gay and Lesbian News Association, Melbourne, Victoria, Australia

Objective: To review materials specifically developed to assist in the understanding of the nature bisexual behaviours and H.I.V. transmission, and the significance this has for educating married homosexual men.

Methods: A review of materials contained in the AIDS and Bisexual men and their partners - Facilitator's Kit, analyzing the approaches most appropriate to educating the target group. Exploring the needs of married homosexual men and their partners, and the implications that these have for educating about H.I.V. prevention.

Results: First hand experience at using materials and the implications that these have for educating about the relevance of the content of the content and the strategies in working with or identifying the needs of married homosexual and bisexual men and their partners.

Discussion: The Facilitator's Kit contains workshop resources which provides participants with experiences leading to an understanding of the range of constraints and needs experienced by married homosexual men and the implications that this has for the education about AIDS and the prevention of transmission.

Conclusion: The opportunity to discuss and explore the issues related to bisexuality, enables one to more fully appreciate the needs and concerns of many men in or community who may be at risk of contracting H.I.V.

Th.E.P.74 EDUCATIONAL INTERVENTION IN A COHORT OF HOMO/BISEXUAL MEN TOWARDS A CHANGE IN HIGH RISK BEHAVIOR FOR HIV INFECTION: AN ASSESSMENT OF THE PROCESS AND ITS EFFECTS.
Cabrera, Carlos; Marcial, F. P. De la Vega, E. M.; Torres, E.; Riera, H. M.; Ruiz, de Mend. Trinidad. A. von Humboldt Univ. Berlin. *MEXICO-Centro. Lima, Peru. **AIDS/CN/Agency for Educational Development, Washington, U.S.A.

Objectives: Developing an educational intervention in a cohort of homo/bisexual men in Lima, pursuing an increase in their knowledge about HIV/AIDS and the adoption of safer sexual practices.

Methods: Fifty middle class homo/bisexual men in Lima, Peru, attend a program of three workshops offering general information about HIV/AIDS and negotiating safer sexual practices, through several group dynamics and audiovisual methods. Pre- and post-workshop questionnaires are given to attendees; so are surveys about the workshops themselves. One month after the last workshop, another questionnaire is given. The trial is controlled through comparison with a non-interventive, parallel group.

Results: The program, begun in 1988, is continuing. The results from the first stages show that: (a) the starting knowledge level was high, so it did not rise significantly; (b) the attendees were generally willing to assume promptly behavioral changes towards risk reduction; and (c) the workshop was generally found to be entertaining and of appropriate length. The information appeared to be new and of appropriate complexity, and the audiovisual presentations were well accepted.

Conclusions: This program shows to be welcome and to succeed in producing the desired for behavioral change. The information level, which was already high when the trial began, does not increase significantly.

Th.E.P.76 STD PATIENTS' AND PROSTITUTES' KNOWLEDGE ON AIDS: MODIFICATION OF SEXUAL PRACTICES, AND EDUCATION NEEDS.
Z. Ezidiye, K. J. Fasanjo, G. Ogunseun
Obafemi Awolowo University, Ife-Ife, Nigeria

Objectives: To assess STD patients' and prostitutes' knowledge of AIDS with a view to identifying education needs and to assess if knowledge of HIV-status could influence sexual practices.

Methodology: 50 randomly selected STD patients and 25 prostitutes/whorehouses were interviewed concerning knowledge on AIDS, and sexual practices. HIV-antibody screening was carried out on all and the results were made known to them. Participants were reinterviewed 6 months later concerning their sexual practices after knowledge of HIV-status.

Results: There were serious gaps in knowledge about transmission and prevention in both groups. Majority of STD patients had prostitutes as clients while prostitutes were not discriminatory. Some used condoms regularly. Majority of participants who know that condoms could be used to prevent STD were not sure of its effectiveness in the prevention of AIDS. Over 50% of the prostitutes who screened negative for HIV-antibody responded 6 months later that they now limit on usage of condoms while 20% of STD patients said they now keep to sex normal partner or regularly use condoms.

Conclusions: Identifying various gaps and other areas of education needs could be used to provide effective information needed to design health education strategies. Knowledge of the negative status of HIV-antibody could possibly be used to modify sexual behaviour in high risk groups. Integration of AIDS messages into STD services is recommended.

E.501 CULTURAL DIFFERENCES IN AIDS-RELATED ATTITUDES, BELIEFS, AND BEHAVIOR CHANGE
Zimmerman, Rick S.; Stevens, K. A.; Fischl, N.
University of Miami, United States.

Objective: To assess differences among Hispanics, non-Hispanic Whites (Angles), American Blacks, and Caribbean Blacks on AIDS-related attitudes and beliefs and their impact on reported behavior change.
Methods: A subsample of 100 of respondents recruited in primary care and STD Clinics for a high-risk heterosexual transmission study received a 25-minute interview. Group differences were assessed with ANOVA, and correlations assessed relationships with behavior change for each of the 4 groups.
Results: Hispanics were most worried about contracting HIV, Caribbean blacks and Hispanics had the strongest moral associations with AIDS. Angles had the most negative feelings about condom use, and Angles and American Blacks had the most negative feelings about the various groups. American Blacks and Blacks reported the greatest intentions to change sexual behaviors, though there were no differences on reported behavior changes. Different variables predicted reported behavior change for the various groups. American Blacks who believed that the proportion of PMA who were women and heterosexual men was high, those with a positive attitude toward reducing sexual partners, and those who saw HIV as preventable were more likely to reduce risky behavior. Hispanics who had strong moralistic attitudes about AIDS, believed promiscuity was important in sex, and that their friends would approve of increased condom use were more likely to have reported change.
Conclusion: There are important cross-cultural differences in beliefs and attitudes about HIV as well as differences in predictors of behavior change. These results have important implications for public health education.

E.503 FOSTERING PUBLIC-PRIVATE PARTNERSHIPS: The New York City Experience. *Mohr, J.; Macgregor, C.; Hantover, Eliza; Maysa-Coslar, R. J.* New York City Department of Health, New York City.

Objective: To describe the design and outcome of the NYCDOH technical assistance initiative for community based organizations under contract to provide AIDS prevention services.
Methods: During the 12 month fiscal year 1988-89, NYCDOH let 30 contracts with community based organizations for the provision of AIDS education and outreach services. To facilitate the coordination and effectiveness of resultant programs, DOH staff provided technical assistance to the contractors. This assistance included program development, training, evaluation design, coordination of borough and city-wide collaborative efforts, and on-site program review.
Results: Requests for technical assistance in the initial stages of the initiative were administrative in nature, i.e. clarification of fiscal and contractual policies and resources availability. Requests made by organizations later in the year concerned more programmatic issues, i.e. staff training, outreach skills, development of referral sources, and evaluation.
Conclusion: The provision of technical assistance must be responsive to the specific needs of recipients. Several factors influenced need and demand for technical assistance, including geographic density of similar projects; size, age and sophistication of agency; familiarity of agency with contract procedures; and complexity of service scope. Thus, a multi-tiered approach was utilized: 1) organizational development, 2) review and staff development, 3) quality assurance and evaluation, 4) review and expansion.

E.505 SOCIAL IMPACT OF HIV INFECTION IN WOMEN.
Barfield, Robert; Oberlin, C.J.; Stone, University Medical Center, Providence, RI USA.

Objective: To study the impact of HIV infection on the families of affected women. **Methods:** 31 HIV-seropositive women, 34 infected by intravenous drug use (IDU) and 9 by heterosexual transmission (HT), were thoroughly evaluated and assessed for 33-month (mean) in a multidisciplinary evaluation. Several factors influenced need for services observed and family counseling was provided. **Results:** The 31 women (mean age 31) had 31 HIV-infected children, ranging in age from 1 to 20 (mean age 12 years). 5 of the women had no living children. For the remaining 26 women, nuclear family structures consisted intact in only 3 instances (12 of 8 infected via IDU and 1 of 21 via HT). Among the remaining 23 women with children, 5 were widowed as a result of AIDS. 11 were divorced and 8 had never married. In only 7 of the 23 families were all older children living with the affected mother. With all women who lived with one or more children, problems related to child care had a negative impact (e.g., difficulty in keeping satisfactory care appointments) on nuclear health care. **Conclusions:** The societal impact of HIV infection is disproportionately large. Much because of the effects of maternal HIV infection on family structure, and because obligations to children often interfere with health care of the mother. More comprehensive efforts to deal with the medical, social and economic aspects of HIV infection in women are urgently needed.

E.502 COMMUNITY-BASED PROJECTS FOR HIV PREVENTION: TYPES OF ORGANIZATIONS, TARGET POPULATIONS, AND EDUCATIONAL STRATEGIES
Kobehuchner, Robert; Martin, F.A.; Diets, E.J.; West, G.R. Centers for Disease Control, Atlanta GA, USA

Objective: To provide financial support and technical assistance to minority and other community-based HIV prevention projects.
Methods: On January 9, 1989, the Centers for Disease Control (CDC) announced the availability of funds for minority and other community-based HIV prevention projects. These projects will be conducted in coordination with existing community organizations including State and local HIV prevention programs. To July 1989, awards will be made to approximately 75 community-based organizations. The CDC expects a large number of organizations to apply for this funding.
Results: Authors will report on the number and types of organizations applying for funds, the demography and risk groups of the target populations to be addressed, their size, and the amount of funding requested. Authors will summarize the proposed outcomes for these projects and the types of activities designed to contribute to their achievement. Authors will discuss the relative likelihood of the success of these projects based on the quality of their plans and their relationship to models of behavioral change. This information may be useful to community-based organizations in designing more effective proposals for behavioral change.

E.504 THE IMPACT ON CHILDREN WHOSE PARENTS OR LOVED ONES HAVE HIV DISEASE
Seligson, Rebecca; Private Practice, counselor and consultant, Cascade AIDS Project, Portland, Oregon, U.S.A.

Objective: To describe the unique personal, social, and familial issues children face when a parent or adult friend has HIV disease.
Methods: Interviews and counseling sessions with male and female children between the ages of 10-18 years and their parent, relative, or adult friend.
Results: Information gathered indicates that there are unique complexities children and their family members experience. Some of these complexities are: isolation, fear, anger, loss, shame, and a need to hide. These identified issues are greatly intensified because of the stigma paired with HIV disease.
Conclusion: Children who live with or know someone with HIV disease face unique difficulties. It is extremely important to identify and assist these children in breaking the cycle of fear and isolation. Care providers need to help children access their barriers and feelings, introduce accurate information about HIV disease, and connect them with appropriate support systems.

E.506 EVALUATION OF CARE PROVISION TO AIDS PATIENTS AND PSYCHOLOGICAL PROBLEMS OF RELATIVES OF (DECEASED) AIDS PATIENTS
Bloom, Frans M. van den; Koozenburg, Hans Netherlands Institute of Mental Health, Utrecht, Netherlands

Objective: Evaluate hospital and homebased care; inventory of psychological problems and coping mechanisms of relatives. By striving for more hospital and home care, the pressure on the supportsystem (partners, family, friends) will only increase, meaning that the patient's social network will be increasingly confronted with shorter and more frequent episodes of hospitalisation. Relatives of deceased AIDS patients are a valuable source of information with respect to the quality of health care, with respect to the feasibility and adherence of homebased care, to their own need for support and help, burn out, and dealing with the process of becoming ill, dying and death.
Method: Interviews with relatives of 100 deceased AIDS patients (the total number of deceased patients in the Netherlands is 300).
Results: The first results of the study, based on 25 interviews, will be presented.

- E.507** PSYCHOLOGICAL STATUS OF PARTNERS OF HAEMOPHILIACS WITH HIV INFECTION: A CONTROLLED INVESTIGATION.
Kilwein, J., Catalano, J., Bono, A., Gerrard, A., Day, A., and Rizza, J.
- Objectives:** To establish prevalence of psychological problems in partners of HIV haemophiliacs; to compare it with that of the infected partners; to identify the characteristics of those with problems; to assess the need for further psychological intervention.
- Methods:** Partners (n=36) of randomly selected and matched for haemophilia severity HIV (+) (n=17) and HIV (-) patients were studied. Measures included psychiatric status (DSG, FOMS, haemophilia), social adjustment, social functioning, coping (self-esteem, health locus of control, Hardiness).
- Results:** The majority of HIV+ subjects were asymptomatic. All the women with HIV-. Psychological status, coping style and other measures of partners of haemophiliacs were not affected by the men's HIV status. There was a trend suggesting that the women had worse psychological functioning than their partners (whatever the men's HIV status), but this seldom reached statistical significance.
- Conclusions:** Partners of HIV asymptomatic haemophiliacs do not appear to suffer more psychological difficulties than those of HIV+ haemophiliacs. Possible reasons for this are considered, and include their being aware of their partner's HIV status for at least three years, and their prior experience of coping with a chronic condition such as haemophilia.

- E.509** A LONGITUDINAL STUDY EXAMINING THE IMPACT OF AIDS AND HIV ON PATIENTS AND THEIR FAMILIES - RESULTS FROM INDIANA, TEXAS AND NEW YORK STATE DATA.
Charles, John, Bonde, A.E., Hensels, L.F., Owen, J., Sherman King, St. Mary's Hospital, London, UK, IRE, U.K.
- Objectives:** To assess with targeting support for infirmal carers by 1) determining anxiety and depression levels in carers 2) establishing the degree of role, habit and attitudinal changes experienced 3) Identifying factors predictive of positive or negative outcome.
- Methods:** Infirmal carers of PWA's and family caregivers were recruited (N=50). Anxiety and depression questionnaires were given along with the St. Mary's Personality, Behaviour and Cognitive Changes questionnaire. Controls were cancer cases (N=50).
- Results:** Carers' lives are greatly affected by the conditions of their partners. Their work and social lives are severely restricted. Very carers reported positive relationship changes. Social support and satisfaction with social support was significantly correlated with anxiety and depression levels in the carers. (P<0.1). Carers at time one were highly socially oriented, 25% being care workers and depressed than index patients. This in itself did not have a welfare effect on anxiety and depression scores in carers. There was a trend for carers to have higher anxiety scores at time two. Those and distressed at time one and two, had less social contact at retest. A predicted factor of increase in stress levels from time one to time two was the perceived (rather than actual) impact on work, social life etc. Correlations with impact on carers of cancer patients are also presented.
- Conclusions:** The impact of the caring role can be horrendous. However, it is possible to locate factors indicating need for support in carers and the areas in which it should be provided.

E.511

- E.508** THE ROLE OF PEOPLE WITH AIDS. THEIR FAMILIES AND FRIENDS AS HEALTH EDUCATORS IN THE AIDS EPIDEMIC
Innes, R., Becken, P., Paine, G. PEOPLE WITH AIDS AND AIDSWORK, Washington DC U.S.A., *National Association of People with AIDS
- Objectives:** To demonstrate that people with AIDS and their loved ones continue to be effective in AIDS education and prevention efforts; and to explore ways of overcoming cultural, social and political resistance to their participation in that capacity.
- Methods:** A panel will model the effectiveness of the peer education approach. Though peer educator programs have been shown to be most effective in reaching people with health promotion messages, this model frequently encounters community resistance when applied to AIDS prevention. A message with AIDS at a classroom presentation may provide the most effective AIDS prevention message to most audience, school boards and/or parents may resist this. The authors discuss ways of working with community groups to promote use of People with AIDS, their families and friends as AIDS educators.
- Results:** Though health education campaigns have repeatedly shown the value of peer education, there is still much resistance to having individuals known to be infected with HIV appear at public presentations, in classrooms, churches, etc. A panel of HIV-infected people model ways to overcome this resistance, describe people living with HIV infection, and promote not only healthier lifestyles, but also compassion and understanding.
- Conclusion:** People with AIDS/ARC/AB+, their families and friends can be effective spokespersons in AIDS prevention efforts.

- E.510** THE IMPACT OF AN AIDS DIAGNOSIS ON PATIENTS AND THEIR SOCIAL SUPPORT SYSTEMS
Lambert, Richard, Janowski, S.,* Vitek-Sharman, L.** Albany Medical Center, Albany, New York, U.S.A., *Albany Veterans Administration Medical Center, Albany, New York, U.S.A., **State University of New York at Albany, New York
- Objectives:** The primary purpose of this study was to obtain information about the impact of the diagnosis of AIDS on the social support system of persons with AIDS (PWA's).
- Methods:** Qualitative, semi-structured interviews with fifteen PWA's and their primary helpers were completed to obtain thorough and specific descriptive information about the impact of the illness on patients and their social support networks. Computerized analysis of this qualitative data was conducted with the Ethnograph analysis software. Interviews were analyzed according to grounded theory qualitative content methods (Glaser and Strauss, 1967).
- Results:** The PWA's and their primary helpers reported profound effects on their social networks due to the diagnosis of AIDS. The stigma associated with the illness resulted in reduced levels of support for the primary support network, and placed them at higher risk of isolated stress. The diagnosis impacted on the depth and structure of the relationship between the PWA's their primary supporters and their social support network.
- Conclusion:** The needs of the primary support network should be assessed and addressed by the mental health professional.

E.512

- PREVENTION METHODOLOGIES FOR WOMEN AT RISK FOR AIDS**
Altmann, Christine and Flanagan, L.P.
Thomas Jefferson University, Philadelphia, Pennsylvania, U.S.A.
- As part of on-going efforts to prevent HIV infection in women at risk, 42 drug dependent pregnant and post-partum women receiving comprehensive treatment were surveyed. Drug use history revealed that 50% are current or past IV drug users with an average of 12 years of needle sharing; 87% of the subjects reported cessation of needle sharing. The women completed questionnaires detailing their sexual and risk behaviors followed by a 30 minute factual didactic session on AIDS. Questionnaires were repeated two to three weeks after the session. Results revealed that 79% are currently engaged in some risk behavior for HIV infection, such as prostitution, lack of condom use and sexual partners who are IV drug users. Nearly all women (97%) knew that AIDS is spread by sharing needles and 85% knew how to effectively clean needles. All women knew that condoms provide protection during intercourse. The women showed concern about AIDS and 71% feared infection, but did not believe they would catch the disease in spite of their past and/or current high risk behaviors. Didactic sessions had little influence on the subjects' knowledge and behavior since differences in pre and post tests were insignificant. These women are clearly at high risk for exposure to HIV infection, both through sexual and needle sharing behavior. Although this survey revealed some cessation of needle sharing practices, condom use and other safer practices were negligible. Conventional teaching efforts had a limited effect on increasing knowledge or changing behaviors. Therefore, these women clearly remain at risk for future infection in them and their children until IV drug use ceases and sexual behaviors change. As a result of this study, other methodologies are being defined in an effort to prevent HIV infection in women who are involved in high risk behaviors.

E.519 AN ETHNOGRAPHIC STUDY OF THE SEXUAL PRACTICES AND DRUG BEHAVIORS OF INTRAVENOUS DRUG USING MALE PROSTITUTES
 Becker, Kenneth D., * University of Cincinnati, Cincinnati, Ohio, U.S.A.

*Cincinnati Health Department; West Central AIDS Education and Training Center and REACH Program, the National Institute of Drug Abuse (NIDA); Cincinnati, Ohio, U.S.A., ** University of Cincinnati, Cincinnati, Ohio, U.S.A.

Despite a widespread belief that safer sexual practices have been adopted by many gay and bisexual men, little research has been conducted to determine the extent of behavioral change that has occurred among male prostitutes since the appearance of AIDS. Additional knowledge in this area is important to determine what factors might be involved in designing behavioral change programs to influence these individuals to reduce or eliminate their AIDS risk behaviors.

Methods: Ethnographic techniques were employed to gain access to a cohort of 30 male prostitutes over a four year period from 1985-1989. **Results:** Half of this sample had used intravenous drugs at least once. All had practiced unsafe sexual behavior on multiple occasions with different partners. Six of the individuals stating that they had practiced unsafe sex also had knowledge of their own HIV seropositivity. The unsafe sexual behavior continued to the present time and for some of the individuals was reported to be increasing along with IV drug use. **Conclusions:** Effective behavioral change programs are needed to decrease transmission of HIV among male prostitutes and their sexual partners.

E.521 EPIDEMIOLOGICAL VARIABILITY AND HIV TRANSMISSION AMONG LONDON PROSTITUTES
 Heston, London, U.K.

J. S. HAY, M.D., M.Sc., J. S. W. HARGIS, The Prud'homme Clinic, St. Mary's Hospital, London, U.K.

Objective: To assess the influence of geographical mobility in relation to HIV infection among prostitutes seen in London.

Methods: An analysis of geographical mobility among 122 women in the Prud'homme Clinic prostitutes cohort was made in the context of regular inter-city and correlated with HIV status and socio-demographic factors.

Results: Forty women (33%), including 1/23 non-British nationals, have worked abroad since 1979 in a total of 20 countries.

No. Visits	Class of Work				
	Male	Continental	Australia	Far	North
	East	Europe	East	West	America
0	21	22	19	5	5
1	1	1	1	1	1
2	1	1	1	1	1
3	1	1	1	1	1

5	1	1	1	1	1
6	1	1	1	1	1
7	1	1	1	1	1
8	1	1	1	1	1
9	1	1	1	1	1
10	1	1	1	1	1
11	1	1	1	1	1
12	1	1	1	1	1
13	1	1	1	1	1
14	1	1	1	1	1
15	1	1	1	1	1
16	1	1	1	1	1
17	1	1	1	1	1
18	1	1	1	1	1
19	1	1	1	1	1
20	1	1	1	1	1

Those who worked abroad were more likely to work privately or for agencies in London than those who did not (20/40 v 30/82, $p < .001$) none was HIV-1 seropositive. On all but 4 visits abroad, mobility was associated with the more or lesser degree of on-site use.

Conclusion: The London cohort is characterized by high mobility, especially among better paid prostitutes, and the place of work influences the safety of the contact. The potential role of prostitutes as "bridges" between areas of relatively high and low HIV prevalence is not borne out in the London study as travel is not associated with areas of known high prevalence.

E.523 SEXUAL PRACTICES AND HIV RISK FACTORS: THE GEOGRAPHY OF PROSTITUTION IN RIO DE JANEIRO, BRAZIL
 Richard G. Barker, Ph.D.
 Universidade do Estado do Rio de Janeiro

Objective: To differentiate distinct forms of prostitution in Rio de Janeiro, Brazil, and to analyze variations in risk-related sexual behavior.

Methods: Descriptive description, based on in-depth interviews with selected informants, is used to distinguish between different forms of prostitution and to map out the social geography of Rio de Janeiro. Patterns of sexual behavior can be linked to patterns of HIV transmission.

Results: Class and gender emerge as key factors in differentiating distinct forms of prostitution. A distinction is made between female prostitution, transactional prostitution, and male prostitution, which, depending on the class background of the participants, take place in specific areas of the city and can be tied to specific sets of sexual practices. Different types of prostitution in different areas involve distinct patterns of heterosexual, homosexual, and bisexual behavior, as well as distinct patterns of vaginal, oral, and anal intercourse.

Conclusions: Understanding these diverse forms of prostitution is essential to understanding the role of prostitution in the spread of HIV, as well as to developing effective AIDS information materials for individuals who are involved in prostitution.

E.520 CULTURAL CONTEXT OF HIV INFECTION AMONG HOMELESS FAMILIES IN NEW YORK CITY
 Sabatelli, Jim
 Community Health Education, Hunter College and HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute, New York, New York, U.S.A.

Objective: To explore the significance of HIV infection and AIDS among residents of homeless shelters with particular attention to women and children in terms of their own understanding and strategies for prevention.

Methods: Field work, structured interviews, participant observation, discussions with groups and collection of documentation. **Results:** Most people in shelters have heard of AIDS; the exception is those who speak mainly Spanish and live in hotels for the homeless. Most people are aware of the main source of transmission. A clear issue emerges with regard to the limitations to their implementing preventive strategies within the life-style imposed by homelessness and lack of resources.

Conclusions: Prevention, either through individual counselling or mediated through medical care facilities, spreads information but attention to the social and economic situation will be needed for more effective change to be implemented.

E.522 SEXUAL PRACTICES AND CONDOM USE AMONGST MALE PROSTITUTES IN LONDON: DIFFERENCES BETWEEN STREETFORING AND NON-STREETFORING PROSTITUTES
 Johnson, T.V., * Bristol, *Bristol, *Bristol
 *South Bank Polytechnic, London, U.K., **Friends' World College, London, U.K.

Objective: To examine the differences in sexual and other practices relevant to the risk of HIV infection between non-streetworking male prostitutes (non-SFPs), commonly known as "call boys", and streetworking prostitutes (SFPs). **Methods:** Between November 1988 and January 1989, as part of an ethnographic study, 12 non-SFPs, 10 SFPs and 7 clients completed a 2h hour-long structured interview concerning sexual practices, condom and drug use.

Results: Reports from non-SFPs and their clients disagree on the incidence of anal intercourse with their clients is low but is higher with non-paying partners. Moreover, they say that condoms are more likely to be used with clients than with other partners. Their clients, however, report anal intercourse to be common.

According to their self-reports, SFPs are more likely to engage in anal intercourse with their clients than non-SFPs. With non-paying partners, anal and vaginal intercourse is high. They report lower rates of condom use than non-SFPs in both cases.

Conclusions: High risk sexual behavior is more likely between prostitutes and their non-paying partners than with clients. SFPs are more likely than non-SFPs to engage in such behavior with both groups of partners. Differences in the reports suggest that some non-SFPs are more likely to engage in "high risk" activities than others.

E.524 THE RESEARCHER-ADVOCACY MODEL: IN THE STEEL OF PMA'S PSYCHO-SOCIAL SUPPORT AS A FEATURE OF PSYCHOLOGICAL RESEARCH
 Shewley, Sylvia G., Ph.D. Physician Behaviour Unit, University of Toronto, Toronto, Ontario, Canada.

Background: Because fatally ill patients (such as PMA's) participating in psychosocial research require researcher support, I adapted Ocaselli's researcher-advocacy model. This study examines its effectiveness for highly stressed research participants.

Objective: This descriptive paper analyzes the methodological features of SOC research projects with 100% participation rates until respondent's death.

Methods: The adapted model is based on PMA's (1) life expectancy; (2) emotional vulnerability; (3) stress levels. Researcher-advocacy includes: (a) type and frequency of feedback; (b) relationship between the researcher and PMA's social network; (c) the researcher's role vis-à-vis PMA's.

Results: The model provides guidelines to psychosocial AIDS researchers. Research was assessed by PMA's and PMA's as a "humming experience" in the two psychosocial studies reported. Where participation was continuous despite acute disease, stress, and opportunity for non-participation, researcher burnout was limited by the reciprocity of support built into the model.

Conclusions: Literature indicates that PMA's are aware of the potentially de-personalizing features of clinical care. The philosophy, structure and continuity of the researcher-advocacy model may counteract the stress experienced by otherwise socially stigmatized research participants.

DEPRESSION LIQUO-INDUITE DES DEFENSES SOCIALES.

RESUME: LIQUO-INDUITE
UNIVERSITE Paris XII Val de Marne, Créteil, France.

Objectif: Décrire la nature des résistances sociales opposées au changement des pratiques sexuelles.

Méthodes: Enquêtes longitudinales:
- enquête de référence BVA-INSEEM, échantillon 1.000 personnes à risques, septembre 1989
- enquête réalisée auprès de 400 étudiants, Laboratoire de Sciences Sociales appliquées, Université Paris XII Val de Marne, Septembre 1989.
Résultats: La sociabilité française qui souvent oppose le privé et le public voit aujourd'hui s'affaiblir momentanément ses défenses collectives: l'information SIDA transmise par les médias et rationalisée par la santé est l'information considérée en réalité virtuelle, hors du champ de la santé privée, hors sujet pour l'individu, stoppée dans l'espace de la télé-sociabilité et donc sans prise sur le comportement des pratiques sexuelles.

Conclusion: Nécessité d'une information de proximité qui relève du génie social.

E.526

PONTIERS DE RISQUE ET SIDA PARMI LES TROISOMES ESPAGNOLS

USCIBO, IBEROPO, SERRANO, J.M.; ANASTASIOU, J.M.; TORRES, J.;... DE NERVO, J.M.;...
* UNIVERSITAT DE VALÈNCIA, INSTITUT DE NERVO, ESPANA; ** MAJORE DE VIDUA, ESPANA; *** UNIVERSITAT DE VALÈNCIA, INSTITUT DE NERVO, ESPANA; **** UNIVERSITAT DE VALÈNCIA, INSTITUT DE NERVO, ESPANA; ***** UNIVERSITAT DE VALÈNCIA, INSTITUT DE NERVO, ESPANA; ***** UNIVERSITAT DE VALÈNCIA, INSTITUT DE NERVO, ESPANA.

Objectif: Connaître d'une façon scientifique la situation des troisomes espagnols en face du SIDA (après les pratiques de risque). Connaître leur opinion en toutes les matières relatives au risque d'être porteur de VIH ou de développer le sida. Étude détaillée des changements des habitudes, etc. des troisomes espagnols. Étude de l'émergence et du refus social en l'Espagne. Méthode: Enquête d'opinion pour toute l'Espagne. Personne âgée de plus de 14 ans. Proportionnel par sexe des villes de moins de 50.000 habitants et plus de 500.000 habitants. Par régions, sept, huit, etc. Questionnaires: 330 questionnaires et réponses possibles. Résultats: 1.117 réponses valides. Avec une erreur $\pm 3,8$ points de confiance ± 2 (95,3%) et la variance pondérée $\pm 10,5$ SD.

Méthodes: 70% des troisomes ont manifesté ou indirectement manifesté le plaisir d'être en tant qu'adulte. Ils ne peuvent pas répondre: 70% à la fois des relations sexuelles avec 5 personnes différentes. Le motif des hommes a réalisé l'évaluation orales et la moitié des femmes ± 10 points. 40% d'emploi entre méthode anticontraceptive. 40% ou corrélaté par le SIDA au risque d'être infecté. 60% s'injecte de l'héroïne, 40% de la cocaïne. Un 30 seulement utilise le préservatif, et cela 20 en usage de contraceptif par jour.

Conclusion: Face à l'apparition du SIDA, 40% connaît le partage par d'agitation et de seringue. Plus de 20 ne peut pas se détacher des drogues. Également, on a constaté d'être des relations avec des prostituées (LIM) 20% a refusé le risque de contracter. 50% propose de tenter le trafic par quitter la drogue définitivement.

PSYCHOLOGICAL CONSEQUENCES OF INFORMAL CAREGIVING TO GAY- MEN WITH AIDS. N.Y.: KENNEDY, VICTORIA, M.; KLEBER, C.; SEGAL, J.; ROYCHAK, A.; HERRICK, D. IONIA, NEW-YORK, CANCER CARE, NEW YORK CITY, U.S.A.

Objectif: To understand the psychological consequences of providing informal assistance and care to gay men with AIDS.

Method: Structured individual interview with gay men with AIDS and their primary caregivers.

Results: The main sources of social support and informal assistance to gay men who were diagnosed with AIDS (in the last 12 months) are their friends and lovers, followed by family members. Analyses of the initial interviews with 20 informal caregivers reveals that, even in the early stages of the disease, when the large majority of the AIDS patients were still functioning well, providing care and assistance was seriously impacting on the caregivers' own lives. A substantial minority of caregivers reported experiencing physical strain, financial burdens and employment related burdens. A sizable minority also scored in the clinical range on at least one of two measures of psychological distress (CES-D or Rutter Malaise). There is little evidence of negative coping strategies, in the form of increased substance abuse, at this stage in their caregiving experience. Furthermore, there are indications that, at least within the first year of the patients' illness, caregivers are finding some satisfactions in their role, feeling good about the job they are doing and finding it to be a source of self-esteem.

E.528

THE ESSENTIAL ROLE OF CASE MANAGEMENT AND COMMUNITY SUPPORT FOR HOME TREATMENT OF PERSONS WITH AIDS. RURAL REGION. ILLINOIS, A.; LIEBOW, R.; BARTLET, L.A. DAKA UNIVERSITY MEDICAL CENTER, DURHAM, NORTH CAROLINA, U.S.A.

Objectif: To assess the need for case management and community support services in a largely rural region for the successful treatment of AIDS patients at home.

Methods: Patients (22) who received therapy for an AIDS defining illness were included for analysis. All persons received at least a portion of their therapy at home. A positive outcome was defined as successful medication at home; negative as admission to the hospital or death. **Results:** Six persons received a complete course of therapy at home, while 16 began home while hospitalized and completed their course at home. Diagnoses included PCP (6), cryptococcal disease (6), CMV (5), wasting/syndrome (4) and lymphoma (3). Therapies included IV fluid and medication (17), aerosolized medication (12), and oral antibiotics (3). Support personnel included visiting nurses (7), family members (8), friends and volunteers (26). Positive outcomes occurred in 12, negative in 4 (all deaths) and 6 remain in treatment. Positive outcomes were associated with the availability of in-home care (6), support personnel (19), mean 3 visits weekly and a case manager (7). Four patients chose to discontinue therapy and subsequently died.

Conclusion: Seventy-five percent of our patients with AIDS were successfully treated at home for complex medical illnesses in a largely rural region. Successful treatment was dependent upon the availability of support services and a case manager to coordinate them. Health care policy in all areas must recognize the need for home nursing, volunteer networks, and case managers in caring for patients with AIDS.

E.529

DEVELOPING AN INTEGRATED AND COMPREHENSIVE LOCAL COMMUNITY RESPONSE TO AIDS IN A LOW INCOME COMMUNITY.

CORREY-RICHARD, COLEMAN, D.; ZELINSKI, D**
*United Way of Franklin County, **Columbus Health Department, **Metropolitan Human Services Commission, Columbus, Ohio USA

Objective: To develop an integrated and comprehensive community plan to deal with the problems of AIDS and HIV illness in a low income community. **Method:** A broad-based group of community leaders was convened to provide overall direction to the effort to respond to AIDS. This group included local representatives from government, human services systems, both public and private, and the business, medical, academic, legal and gay communities. Staff support for this effort came from an interdisciplinary team assembled from 8 local human service systems who were loaned to the coalition for 3 months on a part-time basis. Primary data were collected through individually designed surveys of persons with HIV illness, businesses, hospitals, schools, and human service organizations. Secondary data were collected from focus groups of AIDS-related providers. **Results:** The information base developed by the Staff identified local estimates of incidence through 1991, of numbers of people in high risk transmission categories, current need for both education/prevention and treatment/support and current capacity to address those needs. From these, a plan has been developed that specifies needed efforts, the projected 3-year costs and specific implementation strategies.

Conclusions: The conscious development of a broad-based community approach to the problem of AIDS has resulted in a more integrated and positive community dialogue, more effective interagency cooperation and increased community funding.

E.530

A STATEWIDE APPROACH TO LOCAL PUBLIC HEALTH LEADERSHIP IN HIV PREVENTION. LETHBRIDGE, A.; HECKER, K.; BENTLEY, JUDY; MOER, M.; PARKER, J.; MINNESOTA DEPARTMENT OF HEALTH (MDH), MINNEAPOLIS, MN, USA.

Objective: To design a statewide system that enables MN Community Health Services agencies to develop and implement prevention programs. **Methods:** In August 1987, the Commissioner of Health presented expectations for HIV prevention to 47 community health boards; appoint an HIV resource person, establish a local HIV task force, develop HIV policies, provide and coordinate community education and resources. These expectations are consistent with statewide goals for health promotion. The MDH cooperates with community health boards and staff to: fund 7 model projects, provide statewide conferences on HIV epidemiology, policy development, risk assessment and behavior change, staff an HIV Subcommittee of local health and elected officials, and develop a funding proposal to the legislature. **Results:** All 47 community health boards representing 67 counties have appointed a trained HIV resource person. HIV task forces are established in most areas. Community resources are being assessed and coordinated statewide. The subcommittees develop guidelines and recommendations for HIV program development. The state legislature is considering a proposal for formula funds to community health boards. Education and prevention model projects are available.

Conclusion: Local health departments play an important role in organizing community constituencies to prevent HIV transmission. This role is enhanced through cooperative efforts between state and local health departments. This approach has potential value for other state and local health departments.

E.531

A COMMUNITY-BASED APPROACH TO AIDS PREVENTION AND CONTROL

Reinhold M. Muller¹*, Anne Swaby², Janet Vetter³, Frank Noller⁴
¹Senior Medical Consultant, AIDS Consultants, AIDS Section Staff, Public Health Branch, Ontario Ministry of Health, CANADA

The province of Ontario (pop. 9.2 million) has AIDS of the cases of AIDS occurring in Canada. Epidemiologic surveillance since case reporting became mandatory in 1983 has shown that 90% of cases occur as a result of homosexual/bisexual practices. Some gay communities responded by forming local education and support committees. Recognizing the unique position of community-based organizations in the fight against disease transmission, the Ontario Ministry of Health made the decision to fund community-based AIDS education and support programs. With assistance from community activists, guidelines and a formal application form were developed. The main criteria for funding are: a demonstrated need for a program or service that does not duplicate existing services, strong community endorsement of the proposal, fiscal responsibility and the establishment of a voluntary Advisory Board.

The ministry targeted specific groups as priorities for funding. In the first year 10 community-based AIDS groups were funded and one-time grants were given to 5 other organizations mainly for educational purposes.

This paper will describe the evaluation of these programs after one year and show how funding enables these groups (e.g. IV drug users, prostitutes, men, health-care workers, street youth and ethnic and native communities) to assume responsibility for the control of AIDS and HIV infection at the community level.

KEY WORDS: AIDS, community groups, funding

E.533

AN INNER CITY VOLUNTEER PROGRAM UTILIZING COMMUNITY AIDS EDUCATION AS A VEHICLE FOR RECRUITMENT

B. Powell, T. Iversen, L. Cherry, C. Niles, J. Martin, *Street Outreach*
Imperial Health Center, Bronx, New York, U.S.A.

Objective: To describe the effectiveness of community AIDS education as a recruitment vehicle for Project BRWG, an inner city volunteer program.

Methods: This paper describes our work in recruiting volunteers to provide practical and emotional support to persons with AIDS (PWAs) in the Bronx, New York, an area that is predominantly comprised of people from minority backgrounds and low socioeconomic status. This paper describes an AIDS education model which goes into the community to church and social organizations with already established ties to the people who live and work there. Meetings are scheduled for one restaurant of their choice and are convenient for them. Participants receive culturally sensitive AIDS education as well as an introduction into the psychosocial concerns of PWAs. Volunteers currently working with BRWG also share their experiences and the rewards they have received from doing this work. A segment on the Epidemiology of AIDS in the Bronx, which differs somewhat from the national picture is also provided and adds a very real dimension to the role of the practitioner.

Results: Project BRWG has recruited better volunteers who work on a daily basis with PWAs. We have recruited twenty volunteers who are available on a per diem basis as well as four volunteers who act as peer educators of community AIDS education seminars.

Conclusion: People from minority backgrounds and economically depressed circumstances can be utilized as volunteers for persons with AIDS if agency criteria staffs not only the need for volunteer services but also volunteer opportunities are available to them and their role can have an impact on the community in which they live.

E.535

BUILDING A COLLABORATIVE APPROACH TO AIDS PROGRAM PLANNING: THE BOSTON AIDS CONSORTIUM

Leda, Holly, D. J. Nakagawa, Holly, J. Sweeney, J. A. A. The Boston AIDS Consortium, Boston Foundation, Boston, MA, USA

Objective: To develop an organization to facilitate a community-based planning process that involves all interested members of the community concerned with AIDS service, prevention and education programs.

Methods: A working group was convened in the Fall of 1987 to consider the need for a community-based planning organization for the City of Boston that would focus on the ongoing identification needs for new HIV-related services, education and prevention programs as well as the need for additional resources to support ongoing efforts. It was hoped that a consensus approach would foster collaborative efforts among diverse interests in our community.

Results: Since beginning operations in January 1988, over seventy public and private agencies and two-hundred individuals have participated in Consortium efforts. The Consortium operates nine issue specific Task Forces (Hospital Care, Ambulatory Care, Long-term Care, IV Drug Use, Family Networks, Mental Health, Prevention and Education, Housing and Homelessness) which are collaborative activities open to all. In October, the Consortium released its first publication, *Task Forces: A Boston Foundation Report*, which was distributed and presented it to the State as a way of signifying key issues for discussion that had been highlighted as a result of this community process.

Conclusion: The Consortium provides a useful forum for open discussion and planning of AIDS programs in our community.

E.532

HARVET, AIDEN ***; Bernstein, A.*; Ryan, T.*

¹Congregation Sha'ar Zahav, San Francisco, CA, USA
²Kaiser Permanente Medical Center, San Francisco, CA, USA
³University of California, San Francisco, CA, USA

Objective: To describe the design and operational structure of a community based volunteer program operating in an acute care hospital setting.

Methods: This is a volunteer directed and operated program by members of the Sha'ar Zahav, which provides nutritional, psychosocial, and spiritual support to the inpatient and outpatient populations; significant others and hospital staff are included. An interest assessment of congregational membership was performed. The idea was discussed with the Bikur Cholim (Acts of Loving Kindness) Committee at Sha'ar Zahav, a reform Jewish Congregation. We then presented the concept to administration at Kaiser Hospital, and together developed guidelines. A 1.5 hour HIV sensitivity training was offered to participants. Volunteers prepare food at home and meet at the hospital. Psychosocial and spiritual support is provided as necessary. Volunteers deliver food and visit with immobile patients. We provide a classical music and flowers to enhance the party-like atmosphere. Financial assistance is primarily from contributions directed to the program.

Results: The AIDS Branch Program has been instituted and occurs monthly. It is coordinated by community volunteers in cooperation with hospital volunteer, social services, environmental services, and nursing departments. Chaplains and outpatients, with significant others, as well as hospital staff attend regularly.

Conclusions: An ongoing community based brunch program is providing support for people with HIV disease and others, in an acute care hospital setting. It has been recognized as a model in San Francisco, providing a new adjunct service utilizing community resources.

E.534

A COMMUNITY GENERATED AIDS PREVENTION PROGRAM: THE CASE OF CANDEN, NEW JERSEY

Della, Dora A.; Platt, J.J.*; Wolff, C.*; ¹University of Medicine and Dentistry of New Jersey School of Osteopathic Medicine, Camden, NJ 08103. ²Area Health Education Center, Northgate Plaza, Camden, NJ, U.S.A.

Objective: This presentation is a report of the Area Health Education Center (AHEC) community AIDS prevention outreach program. Attempts at controlling the spread of the AIDS epidemic will continue to depend on education and efforts aimed at attitude and behavior change as we search for a vaccine or cure. Change in behavior can, and should, occur at the micro- and meso-level of human interaction. This project is one such effort.

Procedure: Early in 1988, AHEC received CDC funding, through the NJ Health Department, to provide a culturally sensitive AIDS education program in Camden. In developing the outreach approaches which include home visits, church meetings, etc. AHEC sought and received the cooperation of other agencies, church and community leaders. We present data on 393 participants over a 4-month period. **Results:** 60% of participants were female. Age range = 9-89 (mean 47.7) years, 72% were black, 15% were white, 10% were hispanic. 11% of those reached had never been married, while 22.4% are married. Comparison of the pre- and post- intervention global scores on the knowledge, attitude, and beliefs (KAB) questionnaire demonstrate a significant change in scores. Implications of the results are discussed.

E.536

JOINT CASE PLANNING BETWEEN THE HEALTH AUTHORITY, LOCAL AUTHORITY AND VOLUNTARY ORGANIZATION

Mullis G. ¹ Riverside Health Authority, London, England, UK.

²Hammerstein & Palmer Local Authority, London, England, UK.
³Diagnose. To develop case planning provision of services for people who are H.I.V. positive or have A.I.D.S.

Objective: A series of sub-groups were established to report on the following to the Joint Health Authority, by Mrs. Jessica Gray, Secretary, Dept. Public Health, Central Office, Civil Serv. Dept. Health.

Methods: Joint Planning Demos conducted the Social Services Department Planning & Research meeting to undertake a survey to enable the use to build up a picture of the services already available to those with H.I.V. related disease and the number of people requiring the services.

- Results:**
- 1) The recommendations in these reports will act as a basis for health and local authority planning and service provision.
 - 2) A comprehensive directory of local services for professional working with people with H.I.V. disease has been produced.
 - 3) During the last year a team for 2/3 people with H.I.V. disease has been established by a voluntary organization in the borough. The Social Services department facilitates a voluntary support meeting once a week for local authority H.I.V. positive. The Health Authority provides health care to the residents as necessary.
 - 4) Another team is planned for 1989. A project worker for this development has been funded by the Health Authority to facilitate the development of the home and district initiative between the voluntary organization, Local Authority and the Health Authority.

E.537 COMMUNITY CAPACITY FOR COPING WITH HIV/AIDS
Miller, Sheila, University College London;
McLain, Keville, Institute, Rockdale, OZ689

Objective: To development strategies to monitor resources and needs affecting community capacity to cope with HIV/AIDS; and to support local efforts to enhance that capacity in specified settings in Africa.
Methods: Longterm and interdisciplinary comparison of different types of community affected by the HIV/AIDS epidemic. Social research methods include ethnographic survey employing local people as interviewers; in-depth case studies of family and household dynamics; focus group discussions and Base Observation diaries to monitor change in community attitudes, organisation and levels of morale. All quantitative data will be stored on computer and a data base and monitor created.
Results: These activities will reveal local networks and support systems, sources and channels of communication and information, and the likely boundaries of social and spiritual interaction and opportunity. The methods will provide a basis for qualitative studies of sexual relationships and **Conclusions:** Studies of risk and general survey research to date have been limited with little reference to general health or questions of community identity and social cohesion. This programme will seek to clarify the balance of economic and affective elements. The systematic comparisons proposed will allow both the methods used and the findings on specific communities to be generalised for wider application.

E.539 AN ELECTRONIC INFORMATION AND EDUCATION SYSTEM ENHANCES COMMUNITY AIDS PROGRAMS
Jamison-Smith, Pearl; **Jensen, James**; **Season, Lauretta**; **Levy, James**
*University of California at Irvine, Orange, CA U.S.A.
**AIDS Coalition to Identify Orange County Needs (ACTION), Irvine, CA U.S.A.

Objective: To demonstrate the effectiveness of electronic communication in writing community activities related to AIDS.
Methods: ACTION was established in 1984 to promote and facilitate education, planning, and coordination of efforts in Orange County. More than 50 agencies are currently involved in ACTION. Monthly meetings did not provide the needed communication in a rapid enough fashion. An electronic mail and conferencing system with up to the minute news, medical information and other data sources was implemented. The system, called AIDS (for AIDS Education and Generalized Information Service), is easily accessible using a low cost terminal, modem and telephone line. Currently, no fees are charged for the service, which is inexpensive to operate.
Results: Participants are able to exchange information and ideas rapidly and accurately. Coordination of inter-organization events and projects is greatly simplified. People are better informed, and the decision making process is accelerated, while decision makers are better informed.
Conclusion: Electronic mail and conferencing systems can be implemented by, and are affordable to, organizations and agencies dealing with AIDS, and a substantial return on investment can be demonstrated.

E.541 SOCIOLOGICAL CO-FACTORS IN THE PROGRESSION AND MORTALITY OF HIV DISEASE: BUREAUCRACY, GRIEF, HOMOPHOBIA AND RACISM.

Harrington, Mark; **Bordowitz, G.**; **McCarthy, M.**; **Alderson, O.**
AIDS Coalition to Unleash Power, New York NY, USA.

Objective: To examine political, economic and social structures in the USA which impede access to health care and drug trials, delaying the combat HIV. **Methods:** Analysis of drug development spending; clinical trials protocols; accurate demographics; hospital and trials contracts and Federal legislation. **Results:** Structural deficits in the US health care delivery system include a 2-class medical system, with inadequate access to care for the poor, the slow pace of clinical trials, poor coordination among bureaucracies and the private sector and the marginalization of groups most affected by HIV. New treatments are too costly for many. Congress has not funded for explicit AIDS education materials. **Conclusion:** The HIV epidemic has made acute the chronic inequities of health care in the USA. Health care delivery must become more equitable. Drug development should be streamlined to take advantage of new techniques and discoveries. Drugs should be provided for those unable to pay. AIDS prevention efforts must be frank and comprehensive. People living with AIDS must participate in all decisions affecting their lives.

E.538 PROBLEMS IN EVALUATING COMMUNITY-BASED AIDS EDUCATION PROGRAMS
Clay, David; **Lyne, P.A.**; **Roberts, S.** and **Thom, G.****
*Sheffield City POLYTECHNIC, Sheffield, England; ** Sheffield Health Authority, Sheffield, England.

The paper reviews the development of evaluation frameworks and the emergence of the linear experiment paradigm, which is currently predominant in the evaluation of health promotion strategies. The limitations of this approach in the field of community-based AIDS education are discussed and the need for alternative evaluation strategies, incorporating concepts of utility and durability, is emphasized.

Drawing on examples from the Sheffield AIDS Education Project, key obstacles to effective evaluation are outlined: epidemiological, sociological, political. The conflicting evaluation requirements of service providers and service planners are identified. The role of the evaluator is examined in relation to contrasting models, of inspector and consultant.

Examples are given of how these problems may be overcome in developing practical evaluation processes, agreed to be relevant at city level and proving applicable elsewhere.

E.540 COMMON BARRIERS: TOWARD AN UNDERSTANDING OF AIDS AND DISABILITY
Saids, James C.

B.C. Coalition of the Disabled, Vancouver, British Columbia, Canada

Objective: To examine how people with disabilities ought to understand AIDS.
Method: Literature review of books and articles on social aspects of AIDS compared with articles about Independent Living Movement. AIDS is examined from medical, legal and gay community perspectives with the intention of suggesting how the disabled community ought to view this disease.
Results: AIDS ought to be considered a disability by people living with other disabilities. Persons with AIDS share many common interests and barriers with the disabled community. The concept of Independent Living, defined as "a process whereby disabled citizens achieve their desired individual lifestyle by assuming responsibility for the development and management of personal and community resources," can be useful in building understanding between these two groups.
Conclusion: Disability may be seen as a combination of physical and social factors. AIDS presents these factors in a unique way. Responses to the disease will add to understanding about self-help, self-care and Independent Living.

E.542 ONE CONCEPT OF SUPPORTED HOUSING FOR PEOPLE WITH AIDS

KELING Michael, St Mungo Community Trust, London W6 U.K.

Objective: To provide home-like, stress-free accommodation for people with AIDS who are in a respite condition, but who need to be near a hospital. Units are for three/four people

Method: To develop 'caring' families, who are grouped around a core person without AIDS. The accommodation provides bed and breakfast and all facilities for ordinary living. Bedrooms have en-suite bathrooms, there is a communal living room. A visitors suite is provided. Support is provided by local government domiciliary care and Health Service Community Nursing/Social Workers and Voluntary Organisations.

Results: Since 1987 6 people have been supported in the houses, of whom three have died. Quality of life has been maintained and enhanced. Support has also been offered to families of people with AIDS.

Conclusion: The First house, set up as an experiment has been successful in terms of appropriate care provision and cost effectiveness. Funding has now been agreed by the local Health Authority to fund a development worker for more projects.

E.543 THE COMMUNITY CARE AND RESIDENTIAL CARE NEEDS OF PEOPLE WITH AIDS IN CALGARY: REPORT FROM A DELPHI RESEARCH PROJECT

McDonald, John B., *Maratjan, Thom*
*University of Calgary, Calgary, Alberta, Canada; Executive Secretary, Health and Social Services Council, Diocese of Calgary. **Alberta Social Services, Calgary, Alberta, Canada.

Objectives: To present results of a Delphi Study on residential care needs of people with AIDS in Calgary.

Methods: Interviewer-administered questionnaire examined the expert opinion of 19 persons central to AIDS community and residential care in this city of 800,000 people.

Results: While there was some disagreement, significant consensus emerged for generic hospital acute care services, a carefully and confidentially protecting multidisciplinary clinic, and an integrated hospice care service. (Results accepted for publication in the Canadian Journal of Palliative Care.)

Conclusions: Report concludes with series of recommendations for Calgary Community and for involvements of the Roman Catholic Diocese of Calgary.

E.544 REPORTED SKILLS DEFICITS IN THE USE OF CONDOMS IN A SURVEY OF GAY MEN

Maritz, David J.,* Edwards, C.W.,** Rhodes, F.,***, and Corby, R.H.,****
*UCLA School of Medicine, Harbor-UCLA Medical Center, Torrance, California, **AIDS Intervention Project, Long Beach, California, ***California State University, Long Beach, California, ****Department of Public Health, Long Beach, California, USA.

Objective: To determine skills deficits in AIDS risk-reduction efforts among sexually active gay men.

Methods: A total of 425 gay/bisexual men were surveyed concerning their sexual practices at local gay pride events and among entrants at an ongoing AIDS-risk-reduction education program during the summer and fall of 1988, and their responses compared to those of 2,051 gay/bisexual men surveyed at an alternative test site for HIV antibody testing from December 1985 to February, 1987. In addition, they were queried regarding their use of condoms and lubricants used in anal intercourse.

Results: Compared to those surveyed in 1985-1987, gay men surveyed during 1988 reported reductions in the numbers of new sexual partners, and increases in reduced-risk sexual behaviors, including use of reduced-risk alternatives, and condoms for anal sex. Most reported use of appropriate condoms (latex rather than natural), but many reported use of inappropriate lubricants such as hand lotion, petroleum jelly, mineral oil, and vegetable oil, that increase the risk of condom breakage and intercourse.

Conclusion: These results suggest that ongoing efforts at AIDS-risk-reduction education require greater specificity in information regarding condom use, and may require greater specificity in other areas of risk-reduction information.

E.545 THE CHALLENGE OF AIDS IN AN AREA OF SCATTERED POPULATION AND LOW PREVALENCE

Thorn, Paul
Regional Joint AIDS Community Support Centre, 52 Clifton Road, Newcastle upon Tyne NE4 8QJ England.

Our AIDS and HIV figures are "normal" for the U.K. and very much lower than London - 28 AIDS cases and 259 diagnosed as HIV positive. We have encountered serious obstacles in pursuing our aim of developing non-hospital based care. Among the issues I would like to discuss are:

1. Medicalization of care of people with AIDS.
2. Practitioner/management of established careers - largely medical.
3. Lack of confidence of people with AIDS and medical providers in social workers.
4. Non-reality of AIDS as an issue in areas of normal (low) prevalence.
5. Social workers' perception of being de-skilled by HIV and the implications - is this an appropriate or inappropriate response?
6. Training - who and how to target training to social workers when AIDS is seen only in theory as a priority area, and in practice is seen not to be relevant to most social workers in a local authority.
7. Non-availability of substantial, vocal and cohesive groups of people with AIDS.

E.546 MYTHS AND REALITIES OF THE MIGRATION-AIDS RELATIONSHIP: THE CASE OF MEXICAN MIGRATION TO THE UNITED STATES

Wong, Marc*, Compostress, S. and G.***, Mexico, U.S.A.

*El Colegio de Mexico, Mexico City, Mexico, **OHADENA, Mexico City, Mexico.

The concern about the effect that movements across the frontiers (traveling, migration) may have on the dissemination of the HIV has generated a large number of proposals for action which, in general, imply making a test and exhibiting some kind of certificate with the results. However, little has been researched with respect to the actual impact that IMMIGRATION processes have on the dissemination of the HIV. The case of Mexican migration to the United States enables demonstrating the danger of jumping to conclusions. The analysis of the available information allows showing that while certain data confirm the existence of this relationship, other information weakens it.

The paper will include and up-dated analysis of the existing information about AIDS cases in Mexico and their migratory background. To this date, it has been found that some of the Mexican emities (provinces or states) which largely contribute to migration are over-represented in the distribution of AIDS cases in the United States. There is also evidence that the majority of Mexican migration to the United States goes to those states with the highest prevalence of this ailment (California, Texas). Some preventive measures are suggested, as well as lines of action concerning this population group under risk.

E.547 PROJECT REACH: A PEER APPROACH

Wise, Lynn Ann, Apson, J., Stwertown, S., Ryan, P.,

AIDS Administration DDMH, State of Maryland, U.S.A.
Directed to the health is an HIV prevention and risk reduction outreach program targeting youth in a major resort town. This program was designed to reach youth for whom we had little educational and risk reduction messages were really not available.

Being the summer months, the population of these city, a resort town as Maryland's Ocean City, increases from 17,000 to 250,000. Youth, who come to work in the local businesses for the summer for a vacation, account for much of this increase. To reach these young people, three peer educators, ages 19-23, were retained in this resort town for a summer.

Working out of the Ocean City Youth Health Center, these educators provided direct one-to-one outreach to young people on the beach, at private parties and in street corners known to be frequented for drug and/or sex. In addition, they conducted a 16-week AIDS lecture, offered to local businesses employees a large number of young people, established temporary free condom distribution sites, sponsored "Partner Test" events, established and administered an survey. They also acted as project-OT test counselors for the health center.

These three educators made 3,018 direct one-to-one contacts, distributed over 10,000 condoms, and administered 106 test surveys. Nearly percent of the local businesses contacted agreed to make AIDS literature available to their youth employees. Overall condom distribution for the area increased by 20% during the summer months.

E.548 ANDROLOGICAL FEATURES IN HIV1 INFECTED PATIENTS

Brockmeyer, N.H., Mertins, L., Goss, M., University Essen, Dept. of Urology, FRG

We performed complete clinical and laboratory andrological examination in 20 HIV1 infected patients at state MR 3-5 and a minimum Karnovsky index of 0.7. Diagnostic measures included registration of quantity, motility and morphology of spermatozoa, cultural and immunological assessment of microbiological parameters in sperm and serum/plasma of Testosterone, FSH and all patients analysis of spermatozoa and seminal plasma revealed a higher incidence of abnormally shaped and immobilized spermatozoa compared to normal values in our laboratory. The quantity of spermatozoa was diminished only in patients at state MR4 and 5. Zidovudine treatment caused an aggravation of morphological and functional damage and a further diminution of spermatozoa numbers. In spite of remarkable loss of libido no alterations of endocrinological parameters (LH, FSH and Testosterone) were found neither in Zidovudine treated patients nor in patients not receiving the drug. Compared to normal values in our laboratory there was no increase of leucocyte numbers or microbes in seminal plasma. We found, however, in one case a contamination with *Shigella* not accompanied by clinical or laboratory signs of Shigellosis infection in other organ systems.

E.555 WORCESTER LATINO AIDS NETWORK
Sánchez, Luis, Ardino, J., Ortiz-Ortiz, J., Collazo, J.,
Núñez, M., Rodríguez, L., Trillo, J.,
City Health Department; Worcester Area Community Mental Health Center;
AIDS Project Worcester; San Juan Lutheran Church, Worcester,
Massachusetts, USA.

Objective: To develop effective strategies for AIDS education and risk reduction for Latinos using resources within the Latino community.

Methods: Through the efforts of the Worcester City Health Department, community service agencies, and Latino community leaders, a Latino AIDS Network was established. The following areas of need were identified: 1-Education/Prevention through local media, 2-Education/Prevention for high risk groups: 3-Education for Providers: 4-Education/Prevention for children: 5-Support services for HIV infected Latinos and their families.

Results: The following strategies have been implemented in each area of need: 1-A weekly radio program in Spanish with audience participation dealing with issues and AIDS; 2-Outreach in Night Clubs with distribution of educational materials and bleach/cordons; 3-We AIDS curricula in Spanish for bilingual providers that work in these service agencies and a library with videos directed toward minority communities; 4-The Worcester School Department and the Network has developed and translated into Spanish, a High School AIDS Curriculum; 5-A support group for Spanish speaking HIV infected Latinos and concerned others has been established.

Conclusions: A comprehensive AIDS education and risk reduction program directed toward the Latino community was established in the second largest city in New England. This model may be applied to other urban communities.

E.557 DEVELOPING COMMUNITY PARTNERSHIPS FOR AIDS PREVENTION IN AN URBAN LATINO NEIGHBORHOOD: AN ETHNOGRAPHIC EVALUATION
Lazo, Im, Gordoa, R., Esteves, L., Romo, A.,
Soto, J., Freudenberg, R., et al.

* Segundo Year Health Care Center, Brown, N.Y., USA
** Center for Community Action to Prevent AIDS, Hunter College, N.Y., N.Y., USA

Objective: To describe an AIDS prevention project in a Latino community in the US South Bronx.

Methods: Investigators conducted 30 semi-structured interviews with health center staff and leaders of community organizations - schools, churches and housing projects.

Results: Factors contributing to an effective partnership between an AIDS prevention project and community groups included a clearly defined core audience, previous experience working on drug and sex related issues, a participatory planning process, and a project staff sensitive to socio-cultural issues.

Conclusion: An effective partnership can be established between health centers and community organizations to bring AIDS prevention messages to populations at risk of HIV infection.

E.559 THE EPIDEMIC SPREAD OF AIDS LITERATURE AND ITS IMPLICATION FOR THE MANAGEMENT OF THIS CRISIS
Dobbs, Linda M., Bowd School of Medicine, NYC, NY, USA.

Objective: To identify the major gatekeepers and networks that serve the various public concerned with the state of the field and to examine and compare the roles played by these actors in the dissemination of new findings and information regarding AIDS.

Methods: The major gatekeepers examined are 1) communications from the CDC; 2) TIMELINE; 3) the USFV news service; 4) the AIDS clearwatchhouse (AIDS-C); and 5) self-appointed specialized AIDS news service's current awareness summaries. A typology was developed which was used to classify articles which appeared during the past year by study type, coverage, approach, and type of appearance in any of the five datasets.

Results: Multiple examples of the almost simultaneous appearance of these iterative "findings" (in case reports, drug trials, therapeutic interventions, prevention models) in scientific communications, informal networks, the journal literature and mass media were identified. In addition, many examples of instant coiffination of cutting-edge work in progress research findings to widely networked literature were found.

Conclusions: The crisis brought on by the AIDS epidemic, coupled with the speed with which research findings become incorporated into the bibliographic network and into practice, have transcended the stages of assessment and evaluation traditionally required before new knowledge becomes codified. Structures, roles and mechanisms must be created which will allow for the more scientific assessment of findings and reduce the risk of their premature incorporation into practice.

E.556 SEGMENTING THE MARKET OF BLACK GAY MEN FOR AIDS PREVENTION EDUCATION AND RISK REDUCTION

Alford, J., Tabor Tharion Ph.D., * (Phipps Research and Development, San Francisco, CA, USA)

Objective: To develop an analytic model for defining and differentiating between subgroups of Black men who have sex with other men for purposes of segmenting them for AIDS prevention interventions.

Methods: A review of the literature and ethnographic research led to development of a three dimensional matrix that differentiated between subgroups within men, socioeconomic patterns, and communication styles and channels. The matrix isolates 8 Black men who have sex with other men in terms of the extent to which they self-identify as gay, bisexual or heterosexual; the degree to which they are Black-identified in terms of culture, style and attitudes; and their socioeconomic class (as measured by occupation, education, and income).

Results: Subgroups identified to date include Black gay intellectual/lesbian (men who are high on all three dimensions of the model), Black street prostitutes (men who are Black identified, gay identified, and low on the socioeconomic scale), Black street hustlers (men who are Black identified, heterosexually identified, and low socioeconomic), 3-Black homosexual professionals (Black identified, non-gay identified, and mid to upper socioeconomic), gay-identified Black men (or many identification as gay, low to moderate Black identity, mid to upper income).

Conclusions: Black men who have sex with other men are not at risk of AIDS as a result of their behaviors do not all share the same values, do not all engage in the same behaviors, do not get their information from the same sources or find the same sources credible. Given their differences they require different messages delivered through different media.

E.558 COMMUNICATING RISK ABOUT HIV INFECTION

Engel, Fred; Shepherd, R.; Rosenberg, M.; Wilson, R.,* Centers for Disease Control, Atlanta, Georgia, USA

Objective: To describe the problems and processes associated with communicating risk information to a national audience; effectiveness to date.

Methods: The United States Public Health Service has used a variety of vehicles to inform the American public, including persons at high risk, what factors increased risk of exposure to human immunodeficiency virus (HIV) infection, how risk could be reduced, and what situations entailed low or no risk to uninfected persons. These efforts are often complicated by political, social, scientific, and resource constraints. The effectiveness of these efforts is monitored through a continuous, cross-sectional household survey that measures HIV/AIDS knowledge and attitudes in a probability sample of noninstitutionalized adults (18 years and older).

Results: American adult citizens are very knowledgeable about how HIV is transmitted. Knowledge levels are close to true transmission risk factor range from 92% to 98%. Erroneous notions about transmission risks remain disturbingly high, though steady improvement has occurred over the past 18 months.

Conclusion: Translating scientific findings into understandable and believable communications requires equally scientific rigor. Interpretations, once established, are difficult to eradicate.

E.560 CONTENT ANALYSIS OF AIDS EDUCATIONAL MATERIALS IN THE UNITED STATES

Jahan, A., York, P.M., Ed. M.A., Amy Wolf BS*, Peter DeWitt BS*

* The Project Hope Center for Health Affairs, Washington, DC, USA.

Objective: 1) To develop categories based on social learning theory for classifying the content of AIDS educational messages. 2) To describe the distribution of these categories in a representative sample of materials in the US. 3) To profile content patterns of message content and their relationship with types of media. 4) To correlate relative frequency of content with the effectiveness of a panel of AIDS education experts who independently assessed the quality of materials.

Methods: 1000 AIDS educational materials were selected from AIDS Information Resources Database (American Foundation for AIDS Research, 1988). The 4 categories of media are brochures, cards, and inserts (n=100), pamphlets, booklets, and monographs (n=41), posters (n=60), and videos (n=60). The samples are classified by target group including adolescents, drug users, gay/bisexual men, children/adolescents, HIV test-takers/HIV positive, and others. Ratings are performed by two raters; inter-rater reliability is assessed in a separate sample using Cohen's kappa.

Results: The content categories based on social learning theory are: **Attitudinal** including epidemiology, transmission, community resources, testing and legal issues; **Behavioral** - Target and risk group, symptoms, AIDS history, risk behaviors, safe sex, Risk Reduction; **Practical** and **Interpersonal skills**; **Content/Quality** - **Targetable** and **non-targetable**; **Model**, **process**, **verbal** and **AIDS-related terms**; **Outcomes** and **Humanistic**; **Characteristics** and **media**; **Visual**, **nonvisual**, **nonoral** and **oral**. Kappa on 11 **Attitudinal** items in 9 brochures are distributed: 1=0.4, 1=0.6, 1=0.8, 1=1.0. Efforts have been made to improve reliability where deficient. Ratings of the AIDS education experts have been obtained from the American Foundation for AIDS Research.

Conclusions: Categories for classifying the content of AIDS educational materials can be derived from social learning theory. Preliminary results indicate that inter-rater reliability is adequate.

INNOVATIVE APPROACHES TO SCHOOL-BASED AIDS EDUCATION
REINHOLD, DAVID L.; FALKER, JAMES W. and WILSON, K. A.

Objective: Training and Research Associates, Santa Cruz, California, U.S.A.
Educating: To describe a national school-based AIDS prevention education teacher training project.

Methods: The Teaching AIDS Training Project, developed by ETR Associates and supported by the U.S. Centers for Disease Control, was designed to increase the number of junior/senior and senior high schools nationwide providing effective AIDS prevention education that is locally determined, consistent with community and family values, and appropriate to curricula needs. In 1988 five Texas sites (Arlington, Austin, El Paso, Harlingen and Houston) were selected to receive training for experienced family life educators with a commitment to school-based education about AIDS. By September 30, 1988, 242 experienced health or family life education teachers received the two-day AIDS Teacher Training, resulting in the implementation of AIDS prevention education for over 8,000 junior and secondary level students. After completing the 2-day training, participants were asked to rate each training activity for usefulness and quality on a Likert-type scale. Mean scores for usefulness of activities ranged from 4.07 to 4.82 and quality of activities ranged from 4.16 to 4.88 (highest possible score was 5). A pre-post instrument was developed to measure participant's knowledge about AIDS, HIV transmission modes, at-risk behaviors, and participants' attitudes towards Persons With AIDS. Mean scores from the pre/posttest showed statistically significant increases in participant knowledge and attitudes.
Conclusions: Positive responses were expressed by training participants underscoring the deep commitment and need for providing direction in how to prevent the spread of HIV/AIDS among youth.

E.563

COMPARISON OF ATTITUDES TO AIDS IN 12 COUNTRIES AMONG THE GENERAL POPULATION
L.C.M. ROZENDIUS
Division of Communicable Transmitted Diseases and AIDS
Ministry of Health-Brazil

In 1987, the Gallup Organization, conducted a survey to look at attitudes in the disease in 12 countries including Brazil.

Objectives of the research were: (1) to know attitudes related to some issues in order to set up priorities, for public education and (2) to draw conclusions about the strategies to be used in the future to prevent the epidemic.

Methods: A questionnaire was developed and carried out through domiciliary visits. In Brazil 1200 persons of both sex were interviewed.

The population sampled was randomized and proportional to the size of the administrative regions.

The questions were related to: "the most urgent health problem facing the country at the present time"; "WUI AIDS risk survey"; "Am I at risk?"; "fear at the office"; "attitude of compassion and solidarity"; "AIDS much only homosexual, IV drug users, hemophiliacs, etc."

Conclusion: The data show, that awareness of AIDS is very high, but also show that people are not taking the steps to change their sexual behavior. Substantial numbers of people in many parts of the world still refuse to work with an infected person and that around the world misconceptions are still common. Finally the research also suggests, that people will be able to deal with AIDS as a disease, since direct information is provided.

E.565

SEXUALITE ET COMPREHENSION DU SIDA CHEZ LES LYCEENS ET LES JEUENES FEMMES DE DAKAR ET BANLIEUE
YOUSSEF M. NARGANE OUISSSE ET LUDOVIC D'ALMEIDA PLURALAL SF.
3334 DAKAR.

OBJECTIFS: Les objectifs de cette enquête sur le SIDA visent à déterminer des groupes cibles, d'évaluer leur état de connaissances et les attitudes d'identification, les pratiques, habitudes et conditions culturelles autour de la sexualité. La connaissance des besoins, des attentes, des perceptions et les besoins de l'information, de participer à la conception et à la réalisation des actions de prévention du SIDA. Les groupes cibles sont ici des individus en activité sexuelle évidente: les femmes fréquentant des centres de PMI nombre de 400 au et des individus ayant reçu des activités éducatives: des lycéennes (jeunes) de collèges à Dakar et nombre de 125.
METHODOLOGIE: Un questionnaire comprenant la 4 grande thèmes envoyés a été élaboré et complété par des interviews semi-directives individuelles et collectives.

RESULTATS: Les résultats de l'enquête montrent la nouveauté du niveau de celle de la population cible sur leur savoir positif, fréquence des pratiques sexuelles, multipartenariat, recherche de plaisir multiples. Ceci est des nuances en rapport avec le niveau d'instruction, le sexe-utilisation relativement faible des préservatifs et le multipartenariat; encore persistant montre le divorce existant entre un niveau d'information grandissant et des moeurs et plus ou moins très peu contrôlées.
CONCLUSIONS: L'implication pour des plans pour améliorer et créer des instruments d'information plus adéquats et plus conformes aux réalités sociologiques et culturelles.

E.562

AIDS-RELATED KNOWLEDGE IN A SAMPLE POPULATION FROM A PRIMARILY BLACK, INNER CITY AREA OF THE U.S.A.
BRIKER, JARREN L.; Celentano, D.***; Benedict, A.***; and Sawyer, J.***

***The Johns Hopkins University School of Medicine and **JHU School of Hygiene and Public Health, Baltimore, Maryland, USA.**

Objective: To determine the existing level of AIDS related knowledge in a sample population from an impoverished, primarily black, inner city area of the United States.

Methods: 398 individuals, accessed through a hospital waiting area, were interviewed using a standardized question set developed by the U.S. National Center for Health Statistics.
Results: In our study population, 71% of whom were black and 77% of whom had 10 or fewer years of education, AIDS related knowledge was at least equal to that of the general population in the United States by comparison of results with identical NCHS questionnaires. Specifically, 93% were aware that AIDS is an ultimately fatal illness, 98% knew that the virus can be transmitted by sharing of needles in drug abuse and 96% knew that either homosexual or heterosexual sexual contact may result in transmission. In virtually all AIDS related subject areas exceeding the knowledge level of the sample population was either equivalent to or greater than that known to exist in the general American population.

Conclusions: Efforts to control the HIV epidemic in inner city areas may need to focus much less on increasing simple cognitive awareness, and much more on methods of behavioral modification.

E.564

E.566

ISSUES IN THE SELECTION, TRAINING AND DEPLOYMENT OF AIDS COMMUNITY HEALTH OUTREACH WORKERS: THE SAN FRANCISCO MIDCITY PROJECT

Blernagel, Patrick; Feldman, H.; Knapp, T.; Margolis, E.; Norman, P.
 Youth Environment Study, Inc., San Francisco, CA, USA.

Objective: This 3 year old project was created to intervene in the AIDS epidemic among intravenous drug users (IVDU's) through the use of trained workers (CHOW's) who educate the target groups wherever they can be found.

Methods: The methods of selecting, training and deploying AIDS health outreach workers revolve around a series of issues. Examples of those issues are as follows. Should non-addicted or non-addicted be selected as outreach workers? Are the best training recruits judgmental or non-judgmental about drug use and alternative lifestyles? What perspective works best for CHOW's, psycho-social or socio-historical? How far to go, educator or case worker? Confidentiality a legal and research issue vs confidentiality on the streets. Political and pragmatic considerations in deploying CHOW's.

Results: In the areas where CHOW's have been deployed, their work has had a dramatic impact. An independent survey has shown an increase in needle using hygiene (e.g. cleaning needles between uses with bleach) from 39% in 1986 to over 70% in 1988. The same population reported an increase in the use of condoms from 23% in 1986 to 42% in 1988.
Conclusions: Outreach education has shown great promise in changing the behavior of IVDU's.

Publications

E.567 MAINTAINING AIDS EDUCATION VIA COMMUNITY BASED HOTLINESCassady, M., Miles, T., Spohnhauer, D., Spohnhauer, S.
St. Clare's Hospital and Health Center, New York, New York, U.S.A.

Objective: To evaluate the educational outreach of the volunteer staffed hotline at St. Clare's Hospital, NYC (a comprehensive AIDS Care Facility).

Methods: Training of volunteers by Hospital professionals which includes: 1) interview 2) videotape 3) education 4) study center 5) group support. As a follow-up National Hotline, outreach in National, contiguous states and the local community.

Results: In 1981, the number of calls averaged 500 per week representing a decline of 30% since 1987. The geographical distribution of calls remained the same in 1988 as in 1987. Ninety percent of the calls from New York, 63% from contiguous states (New Jersey, Pennsylvania and Connecticut) and 33% from other states and Puerto Rico. The hotline educating training enables volunteers to disseminate accurate, timely information on AIDS transmission and offer psycho-social support to callers finding hospital professionals from such routine queries.

Conclusions: The decrease of calls are attributed largely to the increasing publicity of AIDS throughout the US-state area and nationally, to the increase of AIDS services and resources. Downstreaming hotline from national to state sponsorship to community health organizations and local hospitals gives the public greater accessibility and options to receive information and referrals. Maintaining volunteers addresses those concerns which allow limited personnel to concentrate their time on effective patient care.

E.568 LET'S TALK! ONTARIO MINISTRY OF HEALTH AIDS HOTLINEShraw, Pamela, Lu, L., Billier, V.***
City of Toronto, Department of Public Health, Toronto, Ontario, Canada, ***University of Toronto, Toronto, Ontario, Canada, ***Street Outreach Services, Toronto, Ontario, Canada.

Objective: To provide telephone service to residents of Ontario as part of the Ministry of Health multi-media AIDS Education Program. **Methods:** A staff of 10 trained operators provide service seven days a week, fourteen hours per day. Callers are provided with 1) information on epidemiology, transmission, prevention of HIV virus 2) crisis counselling, 3) referral to appropriate community resources. **Results:** Major trends in the type of service provided to callers:

Type of Service	Contact	Frequency
Basic Education	Oral sex, casual contact	
Intercourse and general information		87%
Behavioral change re: safer sex		18%
Medical/dental care/support/psycho-social issues		
Health Unit		
Advocacy/legal/complaint		17%

Characteristics of the Caller:
Sex: 34% male 42% female 4% unknown sex
Sexual Preference: 16% same gender 41% bisexual 41% other gender 33% unknown
Age Group: 39% (10-29yrs) 26% (20-29yrs) 16% (20-29yrs) 7% 35 (39yrs) 11% 35 Unknown
Conclusion: The target population (under 39 yrs.) is represented by 80% of callers. An increased awareness of service by 1) non-English speaking, low literacy injection drug use and gay/bisexual population is needed. Expanding the hotline's awareness of AIDS and related services will be essential.

E.571 WAREHO USE GAME: DESIGNED AND CREATED BY MR ARNLEY WAREHO
Nzubei, Sidiem, J.
University of Cape Town, South Africa

Objective and aim: to be simple and informative; to create awareness and educate new sexual attitudes persons about AIDS and prevention in a spirit of competitiveness, the reward being to become "The Grand Master of HEALTH" to change attitudes and behaviour; to create understanding of other religious and traditional beliefs; to create a global spirit of goodwill and cooperation.

Methods: Based on existing tribal games already known in rural and urban areas it was designed to be played in four different ways:

- for the very young player: a very simplified version of draughts;
- for older children a version of snakes and ladders with rewards or admonishment for answering questions correctly or wrongly;
- for sexually active people a more complicated, chess-like game;
- for the general public a game with questions like trivial pursuit.

The board design is a variation of a traditional chess board, with 16 pieces consisting of a hospital, doctors, nurses, nurses (sexually active person or drug pushers hunting to compare sexual partners or drug users), AIDS viruses (carriers) and blood (potentially infected). All four variations can be played by the "captains" of opposing teams on a life-size mat with children at draught pieces. A "referee", for example the Biology teacher or health officer, compares players and outcriers to discuss aspects of the disease and argue against decisions in order to share and improve knowledge. "Live potential" lectures self-study is encouraged from handouts and literary references available at inter-school competitions. **Results:** Enthusiastic response from audience in limited trials.

E.568 DEVELOPING AN AIDS CURRICULUM FOR OUTREACH WORKERSAshley, Rebecca J.
National Institute on Drug Abuse, Rockville, Maryland USA

Objective: To present curriculum content needed to train indigenous outreach workers to educate and motivate addicts to engage in risk reduction behaviors. **Methods:** By anecdotal information gathered by informal survey with 58 sites around the USA which are NIDA funded outreach research demonstration projects. **Results:** An informal survey indicated a myriad of training needs for outreach workers. Primarily, many outreach workers find it difficult to work within the framework of a research project because of the longwinded, field notes and additional paperwork involving number of contacts, type of contacts, etc. that are necessary in such a project. A ranking of training requests from NIDA research demonstration projects indicates the need for skill building in basic outreach strategies. This includes the do's and don'ts of appropriate street outreach contact, troubleshooting situations which will arise while conducting outreach activities, developing rapport building skills, developing and practicing "active listening" etc. Although most of the outreach workers are ex-addicts, many programs indicated a need for workers to understand both the pharmacology and psychosocial aspects of addiction including misuse system impact. **Conclusions:** From this needs assessment a core curriculum consisting of 13 modules was developed and delivered to outreach workers in NIDA funded projects.

E.570 COOPERATIVE LEARNING WITH TEAM PACKS: A ROLE PLAYING PROGRAMFOR AIDS EDUCATION OF ADOLESCENTS
Heston, K.L., Lee D.D., Plummer, P.A., Dorman, S.N., Johnson, Michael P., and Small, J., P.A., Center for Cooperative Learning,
The University of Florida, Gainesville, Florida, USA

Objective: To measure the effectiveness of TEAM PACKS, a self-contained, printed role playing program for AIDS education of 14 to 17 year old high school students.

Methods: TEAM PACKS provide factual information and direct statements, in groups of four with minimal teacher supervision, through a role playing scenario about HIV infection, randomized health checks, received (A) the TEAM PACK, (B) a lecture with matched content, (C) the TEAM PACK and the lecture, or (D) neither intervention. Pre and post tests assessed knowledge and attitudes about AIDS.

Results: Knowledge was significantly improved by each of the three interventions (A, B, or C), as compared to controls (D), attitudes were improved by the combination of TEAM PACK and lecture (see table).

N	KNOWLEDGE				ATTITUDE			
	A	B	C	D	A	B	C	D
67	64	71	72	67	64	71	72	
**	41.9*	29.0*	47.7*	9.5	10.2	10.6	20.4*	11.8

*A of maximum possible improvements = different from control at p<0.05. **Conclusion:** TEAM PACKS, like the lecture, increases cognitive gain. The active involvement of students, promoted by the TEAM PACKS, was essential to effect an attitudinal change. Additional TEAM PACKS dealing with other sexually transmitted diseases should increase the attitudinal change. Whether they will lead to behavioral changes will remain further study.

E.572 AIDS INFORMATION THROUGH CITY WATERBILL DELIVERY IN HOUSTON, TEXAS, USABureau of Epidemiology, Houston Dept. of Health and Human Services, Houston, Texas, USA
Fellitti, Robert L., Bridgewater, S.J., Smith, G. and Shannon, J.

Objective: How to provide written AIDS information in a simple, cost-effective way, to 400,000 people, and in the process, promote other agencies to do the same.

Methods: The City of Houston Public Works Department provides public information on various topics through billing inserts. In order to utilize this distribution method, a question and answer insert was prepared with the most commonly asked questions about AIDS. This insert was written in both English and Spanish at a level of understanding equivalent to eighth-grade reading skills.

Results: In the months of September and October 1987, the AIDS information inserts were included in over 400,000 City waterbills. This was the first mass mailing of AIDS information by the City of Houston to its citizenry. The total cost for this project was \$12,616, for typesetting and printing. No additional postage was required to include this insert.

Conclusions: Other agencies are now interested in trying what the City of Houston has initiated, including Southwestern Bell, Houston Lighting and Power, and Entex Gas Co.

Special thanks to James C. Houghton, M.D., M.P.H., former director of Public Health, and George Crean, City Councilmember, for their direction, support and interest.

Barralera, J., Jarama, J., Uribe, M., Arriaga, J., Gaitaneri, L., Delgado, A., Rodríguez, J.
* Servicio Vasco de Salud Pública, ** Universidad del País Vasco, Leizor, España.

Objectives: Establish a program for the implementation of educational activities (VIE) that are geared to the local situation.
Methods: IMPLEMENTACIÓN: In the Directorate of Centers and the professor responsible of the (VIE) faced the situation actually of the (VIE) and the final objective of the (VIE) was to ensure that the center collected information. RESULTS: periódicos de la Uspide de seral con las personas responsables de cada centro en el momento de las intervenciones con los centros implicados. CONCLUSIONES: El VIE se desarrolló en el mayor número de centros de atención de enfermos de SIDA. **Results:** Durant les sessions de treball (VIE) en els apartaments, s'ha de 2 a 4 a un 75 en els centres de VIE. **Conclusions:** El VIE s'ha desenvolupat amb més èxit en els centres de SIDA. Nos anava pa observar un net progrés de la VIE, la consciència de subjecte i l'atenció a les persones VIH de la part de personal de centres socials i de gestió.
1. L'adaptació de les sessions a les necessitats de cada centre.
2. La comunicació a la direcció de centres i a la persona responsable, avant l'entrada de l'VIE.
3. Fer dels locals comuns, de les associacions i de les persones que s'organitzen al voltant de SIDA.
Conclusions: Nos considerem de gran importància capital la comunicació al Centre (Director, professor responsable de la VIE) i al personal de centres socials i de gestió.
1. L'adaptació de les sessions a les necessitats de cada centre.
2. La comunicació a la direcció de centres i a la persona responsable, avant l'entrada de l'VIE.
3. Fer dels locals comuns, de les associacions i de les persones que s'organitzen al voltant de SIDA.

- E.581** **LEVEL OF KNOWLEDGE REGARDING TRANSMISSION OF THE AIDS VIRUS IN A SAMPLE OF HIGH SCHOOL ADOLESCENTS**
Cohen, Richard, Walter, M., Davis, M., Guterman, E.M., Nichols, J.L., Vaughan, R.D. & Ehrlich, S.A. HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute and Columbia University, New York, New York, USA.

Objective: To describe and compare the level of knowledge regarding casual, IV drug, sexual, blood transfusion, and prenatal transmission of the AIDS virus in a representative sample (N=250).
Setting: A comprehensive cross-sectional questionnaire measuring knowledge, attitudes, and behaviors related to the nature, cause, transmission, and prevention of AIDS was developed and administered during one 45 minute class period in 16 tenth grade classrooms in two suburban high schools.
Results: Preliminary data on 111 students indicate that over 80% of the sample are well informed about IV drug, sexual and prenatal transmission of AIDS. However, students were less well informed about casual transmission and transmission through blood transfusion, with less scores falling to less than 60% correct. New analysis indicates that all items discriminate well in the expected direction between students scoring high and low in overall knowledge.
Conclusions: Even in a middle class high school system that has implemented a mandatory AIDS education curriculum, students maintain modest levels of knowledge of specific areas of AIDS transmission, and show great variability in overall knowledge. This indicates that AIDS prevention education programs need to be tailored to meet the needs of specific student populations, and to focus more on areas such as casual transmission which have major implications for the elimination of AIDS victims.

- E.583** **AIDS EDUCATION FOR FIRST YEAR MEDICAL STUDENTS: A QUASI-EXPERIMENTAL STUDY IN KNOWLEDGE AND ATTITUDE DEVELOPMENT AND RETENTION INVOLVING THREE TEACHING METHODOLOGIES**
Carroll, James L., Wolpe, P.A., J.L.S.A.

Objective: To examine the relationships between AIDS educational methodologies and the development and retention of knowledge and attitudes in first year medical students.
Method: Randomized Pre-post Test Control Group Design utilizing 116 first year medical students from a large urban medical center. A total of six groups were given AIDS education. Two groups received either an experiential, didactic, or audio-visual educational format, while two control groups received no AIDS education.
Results: Data analysis revealed that there were no significant differences in AIDS knowledge or attitude scores with respect to teaching methodology. However, when attitudinal questions were analyzed separately, there were several significant differences in reported comfort levels in working with persons with AIDS. These results indicate that certain teaching methods may be more effective for teaching about AIDS, but that the most effective strategy would be to use a variety of teaching methods. Qualitative data revealed that medical students are feeling afraid and uncomfortable about working with persons with AIDS and that they have a difficult time discussing their feelings.
Conclusions: Much more work is necessary in the area of AIDS education. There is no comprehensive data on how medical students are being prepared to work in the current AIDS epidemic. This study sheds light on this area.

- E.580** **PERCEPTIONS ABOUT PERINATAL AIDS TRANSMISSION AMONG DOMINICAN ADOLESCENTS: KNOWLEDGE AND EMPLOYMENT**
Ojeda, A.; Escalante, John
HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute, New York, New York, U.S.A.

Objectives: Among adolescents in the Dominican Republic, to determine the barriers that must be overcome in order to make effective, a preventive program that emphasizes perinatal transmission of AIDS.
Methods: A series of 30 interviews, individual or small group, among 60 teenagers (36 scholars or students), documents the perceived conditions in which occur, HIV transmission, and perinatal transmission of AIDS.
Results: These were the barriers encountered:
1. Few people mentioned, or appreciated, the role of perinatal transmission.
2. People did not feel themselves at risk. Some expressed disbelief about the presence of AIDS in their country; many considered it a disease confined to homosexual men, Haitians and sex workers.
3. There was considerable objection to using condoms, and many doubted their efficacy in prevention.
4. Mutual monogamy was emphasized; at the same time there was a widely recognized impression that men were "sachs" and not monogamous.
Conclusions: Economic resources (which were not easily available) are required to mount an intensive educational campaign to overcome these barriers. These resources will compete for priority with other recognized health, social and educational needs.

- E.582** **HIV EDUCATION IN A PUBLIC PSYCHIATRIC SYSTEM**
Mullis, Rita; Bennett, M., Jacoby, V., Passafium, N., James, D., Wohlstein, D., Pines

*Department of Mental Health, Boston, MA, USA, **AIDS Action Committee, Boston, MA, USA, ***Boston, MA, USA.
Objective: To demonstrate the effectiveness of small group process in two "train the trainers" models for HIV education in public psychiatric systems.
Methods: To compare and contrast two train the trainer models of HIV education to public psychiatric employees. In the first model, didactic training was the primary method of education. In the second model didactic training was interspersed with small group process.
Results: As measured by evaluation and observation of training participants, the training method that includes small group process, was more favorable than those received for the strictly didactic training.
Conclusion: The more effective method of imparting information to mental health professionals concerning HIV is a curriculum that relies on group process to facilitate the reduction of fear and anxiety associated with AIDS.

- E.584** **"CANADIAN ADOLESCENTS AND AIDS: A SURVEY OF KNOWLEDGE AND ATTITUDES ABOUT AIDS AMONG TEENAGERS VOLUNTEERING IN TORONTO HOSPITALS"**
Lefebvre, Arlette, Reed, S.J., Collins, E., Hogan, T., Snyder, N., University of Toronto, Toronto, Ontario, Canada.

Objective: This study examines the impact of mandatory AIDS education initiated in Ontario Schools during the fall of 1987, on 1000 Canadian and eighty students - 135 females, 45 males, mean age 16.3 years - working as volunteers in 13 Toronto area hospitals. These were surveyed during the summer. In terms of 1) General Health Knowledge, 2) Knowledge about HIV infection, 3) Attitudes towards persons with AIDS and safe sex practices, using both open ended and multiple choice questionnaires.
Results: Knowledge about HIV, but not Attitudes, was found to correlate positively with general health scores. The only variables to correlate significantly with attitude scores were sex (p<0.0001) and rural background (p<0.005) with females and children of Canadian, American and European backgrounds being significantly more positive in their attitudes towards safe sex and persons with AIDS than males and children of Asiatic or Third World countries. Approaching significance were the trends for children of highly educated parents (especially health professionals) to be more negative than children whose parents had not completed high school.
Conclusion: Increased knowledge about HIV does not necessarily guarantee positive attitudinal changes.

E.585 DO SEXUAL PRACTICES IN UNIVERSITY STUDENTS JUSTIFY THE PROMOTION OF CONDOMS?
 IZABELA Antonia, Mendieta M., Valeriano J.L., Sepúlveda J., Townsend J.*

*Instituto de Epidemiología, Ministry of Health, MEXICO. *Instituto Nacional de Estadística y Censos, Mexico

Objective: To describe sexual practices, and knowledge and use of condoms in Mexican university students.

Methods: A survey to determine actual practices regarding the risk of AIDS transmission was carried out in university students in three cities. 8 following resorts and one USA border city. The information was obtained through a questionnaire. 473 men and 430 women were interviewed.

Results: The main results are presented in the following tables.

	SEXUAL ACTIVITY			KNOWLEDGE AND CONDOM USE IN SEXUALLY ACTIVE			
	MALE	FEMALE	P	MALE	FEMALE	P	
AGE (Average)	22	21	NS	Knows condoms	49%	36%	<.001
Sexually active	43%	11%	<.001	Ever used one	39%	16%	NS
Homosexual practices	3.5%	0.5%	NS	Purpose of use:			
Partners (average in the last 6 months)	1.8	0.8	<.001	Family planning	36%	47%	NS
				AIDS prevention	1%	0%	NS

Conclusions: Contrary to expectations prevalent sexual practices in university students justify educational interventions to promote condom use, although it may be thought that Latin American students have less risky practices than students living in industrialized countries. Condom use is now associated to family planning.

E.586 AIDS EDUCATION OF DRUG ADDICTS

 Sorrell S.,* Elton, R.**
 *St. Luke's/Roosevelt Hospital Center, New York, N.Y., USA
 **Montefiore Medical Center, Bronx, New York, USA
 *Presenter

The strategy of risk reduction in substance abusers is dependent on the stage of awareness and recovery of the population. We have shown that the techniques used with a population in methadone maintenance, while similar in form, shows respect to the significant difference of the user on the street, such as bleach to clean their works, or a condom "to protect themselves." This intervention is further distinguished by the need to recognize what phase of drug acquisition and intoxication is being displayed by the client.

This should be contrasted with the needs of the street based interventions that by necessity must be much briefer in duration and be addressed to an immediate interest of the user on the street, such as bleach to clean their works, or a condom "to protect themselves." This intervention is further distinguished by the need to recognize what phase of drug acquisition and intoxication is being displayed by the client.

Notwithstanding the above differences, the similarities of tailoring the materials in a subset, non-judgmental fashion in appropriate language to the audience is paramount in importance. We will present examples of the above intervention in our presentation.

E.587 AIDS KNOWLEDGE AND SOURCES OF INFORMATION ABOUT AIDS AMONG IN DRUG USERS
 McCoy, B.,* McCoy, C.,* McCoy, C.,* Whitwood, D.B.,** and Drapido, E.,** and McKay, C.T.*** *Florida International University, Miami, FL, USA, **University of Miami School of Medicine, Miami, FL, USA, ***

Objective: To describe the distribution by sex and ethnicity/race of sources of AIDS information and to determine the effect of the source of information on AIDS knowledge among IVUDs.

Method: As part of a study which tests two interventions to reduce AIDS among IVUDs, 316 subjects were recruited from drug networks and interviewed. Bivariate analyses were conducted to assess the distribution of information sources and the relationship to AIDS knowledge. Gamma values assess the strength of relationships.

Results: First source was the most likely source of AIDS information used by IVUDs. Information source varied, however, by ethnicity/race and sex and was statistically significant. Each source (TV/radio, print, institutions, personal) was more likely to be the choice of a particular ethnic/racial group. The source of information was also related to the accuracy of knowledge about AIDS. Those who obtain information from individual persons, such as outreach workers and friends, score higher on a knowledge test.

Conclusions: Communications about AIDS should be ethnic/race-specific and sex specific using particular media for each group.

E.588 REACHING HIGH-RISK YOUTH: TRAINING THE PROVIDER

 Popowich, Nancy* (Doctor), L. Rosenfield, C.,** Green, R.***
 *Planned Parenthood, Cambridge, MA, USA, **NIH, Dept. of Health/PHS, Substance Abuse Services, **DHHS AIDS Program, and ***DHHS Addictions and Health Research

Objective: To describe the outcome of a two day intensive training on increasing AIDS knowledge, comfort and skill level in providers working with high-risk youth.

Methods: Three regional trainings for a total of 80 youth intervention program staff took place in the spring of 1988. Youth intervention programs are designed to provide outreach and early intervention services to youth identified with alcohol and drug related problems. The program was planned and implemented with the collaboration of the Dept. of Public Health, Planned Parenthood, community-based agencies and people with AIDS. A safe environment was created by skilled trainers. Role modeling, affective and didactic methods were used. Participants were exposed to issues faced by gay, black and Latino youth from the perspective of members of these communities. Pre, post and follow-up questionnaires were used to measure change in knowledge, comfort and delivery of service.

Results/Conclusion: Preliminary results show significant increase in understanding of AIDS information, in comfort and skill level in addressing issues of sexuality and in comfort and skill level in educating high-risk youth about AIDS and AIDS prevention. Follow-up surveys indicate participants are using the risk reduction and prevention strategies developed during the training.

E.589 POST-TEST DISCOMFORT IN AIDS KNOWLEDGE SCREENING INTERVENTIONS
 DODD, JOHN, PHD, IN A HIGH-RISK AIDS SCREENING INTERVENTION
 Nelson, M.,* J. Beckman, M.D.†, Lipatova, C. (Ch), O'Brien, S.

*Harvard Medical Center/Alburt Einstein College of Medicine, Boston, MA, USA.

Objective: To assess the impact of an educational program on AIDS knowledge among incarcerated IDU's in a New York City detention facility.

Methods: Newly arrested male IDU's were offered a five-session small group AIDS education program as part of a pilot project in 1986-88. Sessions included didactic sessions, role-playing, and printed materials. Participants took self-administered pre-test/post-test true/false pre- and post-tests. Pre- and post-test scores were compared overall, for individuals, by time, and by sociodemographic variables.

Results: Pre- and post-test results were available for 104 inmates, of whom 47 (45%) were black, 46(44%) Hispanic, and 11(11%) white; mean age was 31.7 yrs. 84(81%) had secondary school education or less. Mean percent correct for pre-test was 78%, vs. 88% for post-test (P<0.01), with no significant differences in improvement by race, education, or age. Pre and post-test scores were both 90% correct for those concerning risks of needle-sharing, heterosexual contact, and percutaneous transmission of HIV. Significant post-test improvement (P<0.05, McNemar's test) was seen for items concerning correct anatomy, needle hygiene, percutaneous transmission, and certain needle aspects of AIDS.

Conclusions: Results indicate significant post-test improvement in AIDS knowledge scores among incarcerated IDU's participating in a peer-based AIDS education program, especially regarding prevention behaviors and popular misconceptions about AIDS. Pre-test knowledge was high regarding certain aspects of drug and heterosexual transmission. Data suggest that primary may be stratified advice for targeted AIDS education programs for IDU's, combined with strategies to promote behavior change.

E.590 A COMPARISON OF STUDENTS', TEACHERS', AND SCHOOL BOARD

 PRESIDENTS' KNOWLEDGE AND ATTITUDES ABOUT AIDS
 Huestis, R.C.;* Amos, S.;* Johnson, J.;* Mullins, L.L.;*
 *University of Oklahoma Health Center, Oklahoma City, OK, USA,
 **Case Western Reserve University, Cleveland, OH, USA.

Objective: To determine the level of knowledge about AIDS and attitudes towards persons with AIDS (PWAs) of high school students, teachers, and school board presidents. As most children with AIDS attend public schools, it is important for those who allow children entrance (school board), teachers and administrators, and their peers to have accurate knowledge about AIDS and positive attitudes towards PWAs. In order to design programs to counteract negative public attitudes towards AIDS, it is important to first determine what these misconceptions are. This study explores the knowledge and attitudes of these three groups.

Methods: A previously used knowledge and attitude questionnaire was administered to 10th grade students (n=448), school teachers (n=214), and school board presidents (n=190). The form contained questions about the risk of casual contagion, the meaning of the results of antibody testing, and modes of transmission. The form also contained questions about the subjects' attitudes towards social interactions with persons with AIDS, and whether PWAs should attend public school.

Results: Data will be presented on the three groups' relative knowledge about AIDS and attitudes towards AIDS.

Conclusions: Differences between the groups will be highlighted. Recommendations for educational programs will be made.

E.609 AIDS: DIAGNOSING EDUCATIONAL NEEDS OF HEALTH CARE PROFESSIONALS
 Wright, J.; Fitzgerald, A.; Risi, George; Marier, R.
 Delta Region AIDS Education and Training Center, New Orleans, La., U.S.A.

Objective. To determine health care providers' attitudes toward AIDS education and learning needs in three southern states.
Methods. A written questionnaire was mailed to a random sample of 942 primary care physicians, nurses, infection control practitioners, dentists, dental hygienists and social workers. Additional data was collected from 15 key informant, telephone interviews. AIDS experts in the 3-state region were selected as informants. In addition to statistical analysis of the survey results, the quantitative data was triangulated with qualitative findings from the interview.

Results. An education needs profile within and across professional group categories found that health care professionals and AIDS experts agreed on the importance of AIDS/HIV education but differed on HIV focus. For example, AIDS experts described the need for learning in the psychosocial dimensions of AIDS treatment. Although survey respondents ranked low their current satisfaction level with these issues, psychosocial concerns were not a priority learning need. Instead, knowledge about prevention techniques and high risk groups and profession-specific skills related to AIDS/HIV treatment were more highly rated. Attitudes toward AIDS/HIV infection differed among professional groups as well as their perceived impact on service quality. Implications for educational program based on health providers' learning style preferences and perceived educational needs are discussed.

E.610 TRAINING OF HEALTH CARE PROVIDERS IN SAO PAULO STATE, BRAZIL
 Fernandes, H.E.; Ferreira, A.C.; Grandi, J.L.; Pinto, U.; Del Bianco, F.

Centro de Referência e Treinamento-Aids, Sao Paulo, Brazil

Objective. Training of health care providers to decrease the morbidity and mortality caused by HIV infection in Sao Paulo State.
Methods. 80 hours course, 40 hours of classes and 40 of practice. The program includes the following contents: Epidemiology, virology, pathogenesis, immunology, clinical and laboratory management pediatric Aids, blood bank control, Human sexuality and Educational strategies. We established the same program with 5 clinical multiprofessional team from 5 reference centers in Sao Paulo State. The course evaluation was made using a 15 marks questionnaire two times before and after the course.

Results. 350 Health Care Providers trained in the period between April to December 1988.75% developed local programs for Aids prevention and control.

Conclusion. This is a very effective way of training and demands only a period of 2 weeks.

E.611 A CLINICAL PROGRAM TO TRAIN PHYSICIANS AND PHYSICIAN ASSISTANTS TO PROVIDE OUTPATIENT CARE FOR HIV-INFECTED PATIENTS

Kaiser, Travis, Peters, S. R.; Gales, J. F.; Merritt, S. J.; Lee, F. Y.*
 AIDS Research and Training Center, University of Medicine
 *Department of Medicine, University of Southern California School of Medicine, Los Angeles, California, USA.

Objective. To provide opportunities for PA's with knowledge and skills to manage the complications of HIV infection seen in the outpatient setting, and to increase the number of trained primary care providers caring for HIV-infected patients in the community.

Methods. Physicians and PA's from 3 counties in Southern California receive intensive, 1 week, one-on-one clinical training with a physician specialist in a multidisciplinary, university-affiliated AIDS outpatient clinic. The population includes ethnic minorities (40%), indigent (66%), women (4%), and TOUT's (3%). Additional training is provided in a private physician's office and an STD clinic. Training takes place during the course of patient visits and didactic sessions. Emphasis is on clinical instruction in the context of direct patient care supplemented by a comprehensive syllabus.

Results. Formal evaluation of the program includes exit interviews of the participants and 6 month follow-up. Preliminary data indicate that the trainees' goals are being met by the program.

Conclusion. An intensive, short-term clinical program is effective in modifying clinicians' management of HIV infection.

E.612 EVALUATING AIDS EDUCATION FOR HEALTH PROFESSIONALS

Fearns, James; Harris, V.; Harrison, V.; Harris, R.; Stuebner, J.; Gabel, R.

East Central AIDS Education and Training Center, Columbus, Ohio, USA

The East Central AIDS Education and Training Center (ECATC) has developed a wide range of educational methods and programs to educate health care workers about AIDS. Evaluating the match of educational methods to health care provider needs for AIDS education has been an integral component of ECATC efforts over the last 12 months.

METHODS. The ECATC evaluation effort functions on three levels: 1) **trainee assessment**; 2) **program impact**; and 3) **regional impact**. Methods used to evaluate these included participant assessments of program, program documentation and dissemination surveys, and site visits and interviews.

RESULTS. **Trainee assessment:** 2717 health care professionals completed ECATC program evaluations. Eighty-eight percent of participants indicated favorable responses to: importance/values of training content, improvement of knowledge, quality of presentation and materials, and overall quality of presentation and program. **Program impact:** 16,547 health care professionals participated in ECATC programs, including 3453 physicians; 3813 nurses; 1171 dentists; 2011 allied health; 1933 students; 987 counselors; 71 physician assistants; and 1099 emergency medical technicians. **Regional impact:** 136 key organizations/agencies were contacted in order to establish formal, ongoing linkages; 4000 entries were made in ECATC databases; 3000 newsletters were distributed; and 3000 brochures were distributed. More study is needed in order to determine the long-term impact of such AIDS education and training centers.

E.613 RESULTS FROM 1988 SURVEY OF MICHIGAN STATEWIDE SCHOOL HIV POLICY, STAFF INSERVICE, AND STUDENT EDUCATION
 Hines, Barbara J.; Project Coordinators: Manda Juhnke* AIDS Survey Advisory Committee** * **Michigan Department of Education, Comprehensive Health Services, Lansing, Michigan, USA

Objective. To establish baseline data on the number implementing and quality of Michigan public school policy, staff inservice and student education.

Methods. We AIDS Information Surveys were sent in May, 1988 on HIV program activities for the 1987-88 school year. Districts were asked to report on level activities were sent to 517 superintendents with an 88% return. A 91 item survey on building level activities was sent to 411 middle school principals with a 71% return and also to 613 high school principals with a 73% return. Random verification of survey data was conducted.

Results. Returns showed 74% of the reporting districts had a policy addressing attendance for persons with AIDS. Districts reported 341 had district staff inservice training with principals reporting 41% of the middle and 48% of the high schools had staff inservices. Both the middle and high school principals reported 41% had adopted written routine procedures for blood and other body fluid spills. A district, age appropriate K-12 program for educating students about AIDS occurred in 34% of the reporting districts though less than 10% taught anything in grades K-4, 5% in 5th, and 2% in 6th grade. Planned student AIDS education occurred in 82% of the middle and 78% of the high schools.

Conclusion. Assistance must be provided to school districts on policy issues i.e. confidentiality and handling body fluid spills. More total school staff inservice must occur. Comprehensive health education plan is the most effective.

E.614 THE RELATIONSHIP BETWEEN CONCERN ABOUT AIDS, KNOWLEDGE OF TRANSMISSION, AND BEHAVIOR CHANGE: CORRELATIONS AT THE INDIVIDUAL AND NATIONAL LEVELS
 Nicholson, S. and Horan, R.C.
 AIDS/CDC, Astenberg School of Communication, University of Pennsylvania, Philadelphia, PA, USA.

Objective. To examine correlations between concern about acquiring AIDS, knowledge of transmission, and reported behavior change.

Methods. Correlation coefficients were computed using aggregated data from 34 nations in which the Gallup organization conducted surveys of AIDS related knowledge, attitude and practice. The associations found were compared to results reported from several individual level studies which employed similar questions.

Results. At the national level, concern about acquiring AIDS was associated with belief in transmission by casual contact, a finding similar to several individual level studies that have shown a relationship between low and inaccurate knowledge. Countries with higher levels of reported behavior change had lower levels of accurate knowledge. Lower levels of accurate knowledge were associated with reports of inappropriate behavior change such as avoiding homosexual. Reports of behavior change that involved increasing condom use were associated with concern about getting AIDS, but not with accurate knowledge of transmission. **Conclusion.** Countries in which concern about AIDS was associated with higher levels of reported behavior change had lower levels of accurate knowledge. Lower levels of accurate knowledge were associated with reports of inappropriate behavior change such as avoiding homosexual. Reports of behavior change that involved increasing condom use were associated with concern about getting AIDS, but not with accurate knowledge of transmission.

Conclusion. Countries in which concern about AIDS was associated with higher levels of reported behavior change had lower levels of accurate knowledge. Lower levels of accurate knowledge were associated with reports of inappropriate behavior change such as avoiding homosexual. Reports of behavior change that involved increasing condom use were associated with concern about getting AIDS, but not with accurate knowledge of transmission.

- E.615** CHANGES IN AIDS-RELATED KNOWLEDGE, ATTITUDES AND BEHAVIOURS OF HIGH SCHOOL STUDENTS IN GREECE
 G. Kotsopoulos, A. Katsiava, T. Kioseoglou, G. Achiladeu, C. and Papapanagoulou, V.
 University of Thessaloniki, Thessaloniki, Greece.

Objective: To estimate the AIDS-related knowledge, attitudes and behaviours of high school students and evaluate factors affecting their changes.

Methods: A questionnaire was developed and administered to a national representative sample of 503 high school students, probing their knowledge about transmission and prevention of HIV, their attitudes and their behaviours about AIDS.

Results: Accurate responses about the main routes of transmission were given by more than 90% of the students. AIDS-related knowledge was associated with age and socioeconomic level. Females were less knowledgeable than males, especially in younger and those living in provincial cities. The level of misinformation was high: 25-70% believed that HIV could be transmitted through usual social contact or by scorpion-ticks. Mass media and newsletters distributed through the electricity bill were the main sources of information. Only 11.6% attended relevant lectures. Changes in sexual behaviour were declared by 28.7% of the students. They were more common in males and in older students. Suggestive measures for containment of the disease were suggested more often by younger and male students. Females and older children requested more information and could more often accept carriers as school-mates.

Conclusion: There is great need of implementing a systematic effective educational school programme to improve AIDS-related knowledge, and decrease misconceptions leading to unacceptable attitudes and behaviours.

- E.617** AIDS INFORMATION AND TEEN-AGERS IN PARIS
 Cartiercher, Ivan*, Demand, F., Bravaud, C. ** Unité d'Oncologie Virale, Institut Pasteur, Paris, France.

Objective: To describe the impact of AIDS information on teen-agers, some of them socially vulnerable.

Methods: 600 students from three secondary schools in the north of Paris, age 13 to 16, have been informed on AIDS in February and March 1988. The sessions were informal, with video and slides. A few weeks later, 35% (sex ratio = 1) responded to a confidential multiple-choice questionnaire. 81% reported no sexual relation, 75% were living in an unfavorable environment: low socio-economic level, and ethno-cultural differences (the majority of North African immigrants and Asian refugees).

Results: 54% felt misinformed before this program. After it, the definition of HIV was better understood (95%) than AIDS (70%). 55% knew the three transmission routes among eight choices. Only AIDS knew that seropositives and asymptomatic carriers are contagious. 61% understood what "seropositive" is. Principles of prevention were well assimilated (89%) but 61% would not wait long enough before having the antibody test. Results in the more vulnerable group were not significantly different.

Conclusion: Appropriate information among teen-agers and vulnerable youth has to be stressed:

- transmission modes, particularly sexual, e.g.: HIV infection can escape notice if asymptomatic infected persons are contagious.
- the 3-6 months delay before testing.
- instructions for condom use (e.g. avoid oil-based lubricants), and the necessity not to change sexual partners.

- E.619** Impact of Mandatory AIDS Education on Ontario Schools, 1987
 Arlette LeFebvre, M.D., F.R.C.P.C., Stanley E. Read, M.D., F.R.C.P., F.R.C.P.C., Nathan Silverberg, Thomas Heagy, M.A., Evan Collins, M.D., F.R.C.P.C.
 Hospital for Sick Children, Toronto, Ontario, Canada

Objective: This study examines the impact of mandatory AIDS Education initiated in Ontario schools during the fall of 1987.

Methods: One hundred and eighty students - 135 females; 45 males; mean age 16 years - were surveyed in 14 schools in two Toronto area hospitals were surveyed during the summer, in terms of 1) general health knowledge, 2) knowledge about HIV infection, 3) attitudes towards persons with AIDS, and safe sex practices, using both open ended and multiple choice questionnaires.

Results: Knowledge about HIV, but not Attitudes, was found to correlate positively with general health scores. The only variables to correlate significantly with attitude scores were sex (p 0.001) and sociocultural background (p 0.005) with females and children of Canadian, American and European backgrounds being significantly more positive in their attitudes towards safe sex and persons with AIDS than males and children of Asiatic or Third world countries. Approaching significance were the trends for children of highly educated parents (especially health professionals) to be more negative than children whose parents had not completed high school.

Conclusion: Increased knowledge about HIV does not necessarily guarantee positive attitudinal changes.

- E.616** VALIDATION OF AN INFORMATICE AND EDUCATIONAL PROGRAM IN TURCANOV'S HIGH SCHOOLS STUDENTS.

Inferno, Annalisa*, Orsini, C.**, Prioli, C.***
 *University of Siena, Siena, Italy **University of Florence, Florence, Italy

Objective: To value the preventive capability of some informative instruments, which are different in modality of creation. **Methods:** The informative validity is assessed by a questionnaire, purposely created. The research has been carried out on statistical sample of students of province of Florence. The first validation has been before the informative program (video-tapes) and the second after it.

Results: With this questionnaire has been possible to verify the efficacy of the message and the modification of behaviour.

Conclusion: We could be able to realize a proper preventive behaviour. Today it constitutes the only form of struggle against the disease.

- E.618** AIDS INFORMATION IN FRENCH YOUTH
 Demand, François
 Unité d'Oncologie Virale, Institut Pasteur, Paris, France.

Introduction: AIDS information is still underdeveloped amongst french youth. NGOs may be incorrectly perceived. Only a minority have benefited from personalized information, mostly at school, given by physicians, school nurses or educators.

Objective: To improve AIDS prevention for the young.

Methods: Among the 10,000 students that I personally informed from June 1987 to October 1988, more than 1500 expressed their opinion through an anonymous questionnaire.

Results: AIDS provokes contradictory attitudes: although they deny any DIRECT threat from the epidemic, the young are bothered and disturbed by the media giving too much heterogeneous information that is sometimes incoherent and polemic. They feel that AIDS will in the short term modify their sexual and social behavior; they are waiting urgently for authentic, more human and explicit information, indispensable for AIDS awareness. To better involve the young in AIDS prevention, new models of information are suggested, e.g. a "second generation information": we need motivated young volunteers, previously trained and informed to convey basic data on AIDS, leading to concrete preventive counseling.

Conclusion: - The more specifically designed information modes given by AIDS to youth leaders to the young, the more efficient the prevention;

- School is one of the best environments to experiment with these models (formal and non-formal);

- personalized information delivered to small groups is necessary to teach them how to use condoms and to recommend to them their use in any new relationship (always of uncertain origin).

- E.620** AIDS KNOWLEDGE, ATTITUDE AND BEHAVIOR PATTERNS AMONG UNIVERSITY STUDENTS IN Ibadan, NIGERIA.

OLADINJI OLUFEMI, Ph.D. M.P.H.
 W.R. BRIDGER M.P.H., University of Ibadan, Nigeria.

This study investigated the knowledge, attitudes and Personal Behavior of University Students related to AIDS. Two hundred and fifty two students from the University of Ibadan randomly selected from eight faculties were surveyed. Results indicated that 50.7% of respondents knew that AIDS is caused by a virus but 77.5% thought the disease could be spread through kissing, hugging or shaking hands and 48.0% believe they cannot have AIDS. Their respondents showed a high degree of aversion to AIDS victims while about a quarter reported having multiple sexual partners in the last five years. The results suggest that well organized, specifically targeted health education programmes are needed for University Students.

E.627

AN INTEGRATED APPROACH TO HIV-RELATED CURRICULUM FOR PHYSICIAN'S ASSISTANT STUDENTS:

Richard Lyons, R.A. and Maza, R.D.

Department of Physician Assistant Studies, The University of Texas Medical Branch, Galveston, Texas, USA.

The Department of Physician's Assistant Studies developed and implemented a curriculum to teach physician's assistant students about the didactic, clinical, and psychosocial aspects of HIV infection. Student attitudes about AIDS and AIDS patients were measured using the Sham-Torner AIDS Attitude Questionnaire at various points in the program curricula. The object of the model curriculum has been not only to make physician's assistants students more knowledgeable about the pathophysiology, diagnosis, and prevention of AIDS diseases but to stimulate an awareness of the psychosocial consequences and implications of HIV infection as well. An integrated methodology was devised for the Junior year curriculum which placed appropriate information in numerous existing courses beginning with the Patient Evaluation II and Problem Solving Techniques, and extending through the Preventive Medicine and Community Health and Human Dynamics III courses. For senior students, the materials were covered in several senior seminars at the end of clinical rotations. Senior students also participated in a 4-week rotation with direct clinical contact with HIV-infected patients. Prior to patient contact, all students are taught basic principles in pathophysiology, diagnosis, and treatment/prevention for care of patients with HIV infections. Results of the attitude survey will be utilized to make adjustments in the program curricula.

E.629

FACTORS PREDICTIVE OF AIDS-HIV KNOWLEDGE AND ATTITUDE AMONG NURSING AND MEDICAL STUDENTS

Joseph, Thomas P., Shinn, M.P., Beckel, M.P., Belden, M.P. and Ish, J.

University of Illinois at Chicago, Chicago, Illinois, The University of California, San Francisco, California, USA.

OBJECTIVE: To identify psychosocial and personal variables that explain negative attitude toward AIDS patients and nursing and medical students. **DESIGN:** A total of 113 nursing students and 118 medical students were surveyed regarding their knowledge and attitude about AIDS. The estimate of knowledge of HIV infection did not differ significantly between nursing and medical students. Students were also surveyed regarding their level of homosexuality, drug use, and indicators of drug use. **SETTING:** The University of Illinois at Chicago and the University of California, San Francisco. **MEASUREMENTS AND MAIN RESULTS:** Knowledge about AIDS was higher in HIV infection than in medical students, although an differences emerged between nursing and medical students in regard to their overall AIDS attitudes, but not a sub-set of it. The majority of students, however, demonstrated low for HIV infection attitude to be negatively associated with age.

Multiple regression analysis was performed to determine what best predicted low attitude of AIDS knowledge, AIDS attitudes, and AIDS attitudes toward patients (measuring a student's willingness to work with AIDS patients), and negative affect (measuring a student's endorsement of negative attitudes responses in regard to a person with AIDS). Predictive variables were entered: response to the regression equation following the forward entry of items from the Comprehensive Social Desirability scale. Results indicated that the best predictor of knowledge, medical information about AIDS was an overall negative attitude towards AIDS. Lack of clinical experience with AIDS, the perception of prevalence of HIV, and homosexuality also significantly added to the prediction of low scores on AIDS knowledge, medical information about AIDS was an overall negative attitude towards AIDS. Homosexuality, an indicator of drug use, and of clinical experience with AIDS patients, high school seniors, and low levels of homosexuality also significantly added to the prediction of negative AIDS attitudes.

The best predictor of both professional knowledge and negative affect was homosexuality. Encouraged this prediction, the use of drug use and low level of clinical experience also significantly added to the prediction of professional knowledge, whereas only an indicator of drug use, and low levels of AIDS knowledge significantly added to the prediction of negative affect. The results of this study suggest that the best predictor of knowledge, medical information about AIDS was that will be additive in changing attitudes. Positive attitude an opportunity essential to the availability of our staff and students about AIDS. The results also suggest that increased experience with AIDS patients, as well as greater familiarity and exposure to the theories of drug use at high risk might help. Attitudes negative AIDS attitudes and reduce positive AIDS patients among future health care givers.

E.631

WORKING WITH AIDS IN THE HEALTH CARE MODEL CURRICULUM FOR REGIONAL TRAINING OF CAREGIVER PROVIDERS

Heister, Michael J., Mack, J., Diller, J.J.

Duke, B., Batters, D., *** Ministry of Health, Trinidad and Tobago, *** Caribbean Epidemiology Centre and the Pan American Health Organization, S.A.

OBJECTIVE: To address the information and training needs of health care providers in the Caribbean regarding AIDS prevention counseling with clients and patients.

DESIGN: Two sets of regional training materials for 40 health care providers from 19 English-speaking countries in the Caribbean led to the development of training guide to be used throughout the region. Components of the training and the guide were tested among focus groups and the pilot trainers were implemented in national workshops as well.

SETTING: Sixty health care professionals from the Caribbean rated the workshops as timely, informative, effective, and valuable to their AIDS prevention efforts. During a four-month period more than 2000 individuals in 18 countries were reached with AIDS prevention counseling messages by these same 40 participants. As a result, a training guide was developed and is currently in use in the field.

CONCLUSION: A train-the-trainer model for disseminating AIDS prevention counseling skills can be effective among health care providers in the Caribbean. A guide to supplement these trainings has been useful in ongoing efforts.

E.628

SELF-SELECTION AMONG PROSPECTIVE HEALTH CARE PROVIDERS AS A FACTOR IN AIDS EDUCATION

John, Margaret B., Forewille, T.J., Bannett, H.B., Hoang, B.A., Zupina, L.J., Dinger, J.

University of California, San Francisco, California, United States

OBJECTIVE: To identify the characteristics of those individuals who seek to take an AIDS education course. In so doing, we sought to determine if self-selection for a study of AIDS education was related to demographic characteristics such as race, gender, marital status, and other factors. **DESIGN:** A cross-sectional study of 1000 health care providers at the University of California, San Francisco (UCSF) were surveyed regarding their demographic characteristics, their race, gender, marital status, and other factors. **SETTING:** UCSF School of Medicine and those sites who did not. **MEASUREMENTS AND MAIN RESULTS:** Data from UCSF analyses indicated that the decision to take an AIDS education course was contingent upon both sex and gender. A statistically significant proportion of women elected to take the course in comparison to men, and a statistically greater proportion of whites elected to take the course in comparison to nonwhite students. The significance of gender and race was not significant with respect to entering professional training. However, when asked to take the course, however, women did not with significantly more enthusiasm than men. The decision to take the course was not significantly related to age, marital status, and other factors. **CONCLUSIONS:** The decision to take an AIDS education course was contingent upon both sex and gender. In addition, with respect to the decision to take the course, there were no significant differences by profession.

CONCLUSIONS: The decision to take an AIDS education course was contingent upon both sex and gender. In addition, with respect to the decision to take the course, there were no significant differences by profession.

E.630

Projet de communication au congrès international sur le SIDA

Les travailleurs sociaux et les représentants

du SIDA au Québec

Maria Conaire, Coimbatore, Pérou

E.P.S.I. (Ecole de Service Social), Clermont, France

Martin, Nicole

L'objet de la communication que nous souhaitons faire est de montrer comment un centre de formation de travailleurs sociaux peut être à l'origine d'un mouvement de sensibilisation sur ce qu'est le SIDA, et cela à partir d'une part de recherches menées par des étudiants et des professionnels, d'autre part de journées d'information et de formation.

partant de ce principe, nous avons proposé un travail qui pouvait s'articuler de la façon suivante :

- une phase d'investigation sur le terrain afin de connaître les réalités + population ciblées + réaction des travailleurs sociaux + ceci grâce à un travail recherche mené l'une par les étudiants, l'autre par les professionnels de la Région.
- une phase d'information + grand public (2 jours) + de travail (6-7) au sein d'une action collective de prévention et d'information dans un lycée. Le tout devant déboucher sur la production d'un document final qui serait pour objectif de aliter le problème de SIDA au QUÉBEC.

Notre souhait est de mobiliser par un travail action-recherche le maximum de professionnels autour du problème du SIDA.

E.632

IMPLEMENTING UNIVERSAL PRECAUTIONS IN A TEACHING HOSPITAL UTILIZING A CASCADE TRAINING METHOD

Hedley, D. and Johnston, Peter C.

Departments of Nursing and Medicine, Veterans Administration Medical Center and The University of California, San Francisco, California, USA

Ours is a 300 bed teaching hospital with 1500 full and part-time employees in a area of high endemicity for HIV infection. The need to introduce concepts of universal precautions provided the means to simultaneously disseminate basic HIV information. This program consisted of the following elements: 1) a core MD/PHN faculty, 2) support of hospital administration, and 3) emphasis of content to accommodate classroom work units. Employees were chosen by supervisors to be trainers based on criteria that selected for teaching potential rather than by professional status within the work unit. Two half-day seminars were attended by 38 trainers from 23 departments. Trainers were then required to hold at least one training session within their work groups. The faculty assisted on individual programs and monitored content in the first 3 months of the program, nearly 750 hospital employees received documented training. As a result, there has been 1) widespread compliance with new infection control procedures, 2) decreased anxiety regarding HIV transmission in the workplace as evidenced by decreased demand upon infection control nursing staff, 3) decreased use of inappropriate barrier protection, and 4) increased demand for Hepatitis B vaccine among high-risk groups. Hospital employees can successfully be taught basic HIV concepts by peers rather than by traditional teachers such as physicians and nurses.

E.633 SEXUALLY TRANSMITTED DISEASES AND THE AIDS EPIDEMIC: POLICY IMPLICATIONS

Author: Reid,^{*} Hessell, D.^{**}
^{*}Family Health International, Triangle Park, North Carolina, U.S.A.
^{**}Research Triangle Institute, Research Triangle Park, North Carolina, U.S.A.

Objective: Describe the policy implications of data showing that STDs increase HIV transmission.

Methods: Computer simulations using two different models of the effect of STDs on HIV transmission were run and the history of successful AIDS control efforts in the United States was reviewed.

Results: Computer simulations suggest that control of STDs will slow the HIV epidemic. If appropriate educational strategies are followed, the epidemic's impact is likely to result in sustained behavior change and a lower incidence of STDs in the population. Additional considerations suggest that STD control should be the priority intervention in developing countries with high rates of STDs.

Conclusions: 1. It is important to use persons with AIDS in health education and STD Programs. 2. STD control should be a priority because (1) behavior change and condom use are generally resisted until late in the course of the epidemic; (2) treatment of STDs is highly sought by high risk groups; and (3) STD treatment facilitates health education of high risk individuals.

E.635 REPORTED KNOWLEDGE, CHANGES IN MID SOUTH TEXAS URBAN RESIDENTS: LONGITUDINAL RESULTS OF AN INTENSIVE HIV INFECTION COEXISTENT INTERVENTION

Author: Christie,^{**} Zylot, P.^{*}; Shomaker, P.^{**}; Hallstar, A.^{*}; O'Conn, R.^{*}; and Reed, C.^{**} ^{*}The University of Texas Health Science Center, Houston, Texas, USA. ^{**}The University of Texas, Austin, Texas, USA. ^{***}Centers for Disease Control, Atlanta, Georgia, USA. ^{****}Texas Department of Health, Austin, Texas, USA.

Objective: To assess the effects of a community intervention on reported knowledge relating to HIV infection.

Methods: Randomly sampled residents of a large Mid South Texas city completed a telephone survey in 1987 (n=603) and one year later (n=207, use sample of respondents). The survey included questions on HIV-related knowledge, attitudes, behavior and sources of information. The intervention included an AIDS hotline, factored communications in the local media, safer sex workshops, counseling and testing, and the passing of an AIDS anti-discrimination ordinance.

Results: Knowledge about transmission of HIV and HIV symptoms increased 6% (p<0.05) and 15.3% (p<0.1) respectively. At baseline, 43.4% cited television as the most influential source of information about AIDS, whereas physicians and health care providers were the most important source a year later (18.8%), followed by television (16.8%), mailings (12.8%), magazines (10.8%) and newspapers (6.8%).

Conclusions: Reported knowledge increased in a cross-section of urban residents after a multi-dimensional community AIDS prevention program. Reported information sources increased in variety which is a key element in successful public health AIDS prevention campaigns.

E.637 AIDS KNOWLEDGE AND ATTITUDES OF STUDENTS FROM A SELECTIVE U.S. GIRLS' PAROCHIAL PREPARATORY SCHOOL. Genser

Author: Genser, S.^{**}; Preston, A.^{**}; Hawkins, K.^{**}
^{*}National Institute on Drug Abuse, Rockville, Maryland, U.S.A.
^{**}Potomac, Maryland, U.S.A.; ^{***}Washington, D.C., U.S.A.

Objective: To trace the early development of AIDS knowledge and attitudes in primary school students in a selective Episcopal girls' preparatory school and compare results to a national sample of adult women.

Methods: Questions covering basic biological facts and attitudes about AIDS were selected from the National Health Interview Survey (NHIS) for 11th Stat). The resulting questionnaire was administered to entire classes in the 5th and 6th grades (ages 10-12) for a total N=72.

Results: In this unusual sample of students, the 50th percentile corresponds to overall aptitude to the 97th national percentile. In the school, 88% of families pay the full annual tuition of over \$8000/yr., 99% of graduates attend selective colleges & there are 16% minority students & 9% foreign nationals.

On the factual questions, the 5th and 6th grade scores are significantly different at 41% & 56% respectively. Patterns of responses reveal areas in which these subjects (4 samples of male students and adults from different studies) show developmental progression.

On the attitudinal questions, the majority of the acquisition of accurate knowledge or beliefs, the rejection of inaccurate knowledge, and the unique sample for a cognitive/developmental theory of the acquisition of AIDS knowledge and beliefs are discussed.

Conclusion: Studies of the early patterns of information acquisition may point to educational efforts to strengthen the often tenuous connection between knowledge and effective prevention.

E.634 AIDS/HIV INFECTION AND OUTREACH PROGRAM FOR HEALTH CARE PROFESSIONALS

Author: De Ma,^{*} Fraser, M.^{*}; Paley, J.^{*}
^{*}Center for Interdisciplinary Research in Immunology and Disease (CIRID) at University of California at Los Angeles (UCLA), USA. ^{**}CIRID at UCLA and UCLA School of Nursing, USA

Objective: To develop a comprehensive AIDS educational program specific to the needs of health care professionals.

Methods: The program is comprised of four components: needs assessment, interventions, follow-up and evaluation. Interventions utilize conferences, lectures, workshops for health professionals. These also include the training of those individuals responsible for the instruction of physicians, medical students, nurses, nursing students, and other medical staff. The use of audiovisual educational tools (AIDS Training Modules/C.R. Levin, MD) is incorporated into the program when appropriate. Collaborations with other medical institutions and organizations promote the implementation of program. Resources materials produced by CIRID at UCLA include the AIDS/HIV Progress Guide for Medical Professionals, Textbook of AIDS, and AIDS/HIV Infection: A Reference Guide for Nursing Professionals. These materials are provided through the AIDS Training Program Guide for Medical Professionals. Textbook of AIDS and evaluation include surveys of AIDS-related needs of nurses, physicians, dentists, and dental students.

Results: Needs assessment has indicated a need for AIDS knowledge and skills by health professionals and a preference for continuing education courses as the method to gain such knowledge. Surveys have shown AIDS related fears to be prevalent among health professionals and students and a decrease in giving health care to the HIV-infected individual. Evaluation has shown that continuing education can bring health care knowledge and attitudes. Data from a one-day AIDS conference for nurses demonstrated that significant pre- and post-conference improvements had occurred in both knowledge and attitudes (p<.05); these were changed in 60% (p<.05) of the participants three months later. In large differences took place in the group with low knowledge of AIDS.

Conclusions: The experience indicates that traditional AIDS education for the health professional relies on addressing their specific concerns using both topical and integrative educational tools. This program has been conducted in several sites (including outside California) and can be adapted to local circumstances.

E.636
E.638 AIDS KNOWLEDGE AMONG UNIVERSITY STUDENTS

Author: Reuter, Buente,^{*} Katz, D.^{**}; Vader, J.P.^{**}; Foxman, B.^{**} et al.
^{*}University of Michigan, Ann Arbor, Michigan, ^{**}Institut Suisse de la Santé Publique, Lausanne, Switzerland.

Objective: To assess AIDS knowledge among students at a large Midwestern university.

Methods: A 24-item questionnaire assessing knowledge of HIV prevalence, transmission, and infectivity was administered by telephone to 216 randomly-selected students at the University of Michigan in March 1988 (response rate 78%). Each student was also asked about socio-demographic characteristics and whether the student was, by self-assessment, "sexually active."

Results: Students are very well-informed about annual transmission of AIDS; more than 90% agreed that condoms are protective and that risk increases with increasing number of partners. However, many still believe AIDS can be transmitted by casual contact; shared eating utensils and toilets were considered unsafe by 30% and 21%, respectively. Age, sex, race and sexual activity are the most important predictors of AIDS knowledge. Knowledge is greater among students aged 21 and older (odds ratio=1.9, 95% confidence interval=1.1-3.4); men (OR=1.7, CI=1-2.9); whites compared to blacks and Hispanic (OR=2, CI=1-3.7); and sexually active students (OR=5.5, CI=2-13.8). Age modifies the relationship between sexual activity and knowledge (OR=9 and 2.1 for young and old students, respectively).

Conclusion: Education efforts directed towards university students need to distinguish more clearly between safe and unsafe activities. Health education should target particular groups - women, younger students, and minorities - that are less knowledgeable.

Publications

- E.639** SURVEY OF COMMUNITY COLLEGE STUDENTS' AIDS KNOWLEDGE, ATTITUDES, AND RISK BEHAVIORS
 Anderson, R.A.,* Freeman, A.C.,* Betty, S.A.,** Tabors, J.,** and Haley, Charles E.,* Dallas County Health Dept., Dallas, TX, USA, **Professional Management Associates, Rockville, MD, USA.

Objectives: To determine the baseline level of AIDS knowledge and attitudes prior to a major media intervention, to provide data for development of curricula, to measure the level of risk-taking behavior. **Methods:** Students in 2 community colleges were asked to complete a 50 question survey during regularly scheduled classes. A seven point Likelihood scale rather than a binary true/false scale was used to measure knowledge of mechanisms of AIDS transmission. **Results:** A total of 420 students completed the survey: 60% female, 30% married, 41% freshmen. The students answered most transmission questions correctly. They might be exposed to HIV in the future by living with an infected person. 33% thought AIDS cases should be quarantined while 58% would attend class with a person with AIDS. 43% of the men with multiple sex partners thought they might be exposed to HIV in the next 5 years. Men were less likely to engage in promiscuous sexual behavior than men (19% vs 4%), but also less likely to use condoms. Other differences emerged when controls were introduced for age, marital status and ethnicity. **Conclusions:** AIDS education program aimed at heterosexual college age students must take into account gender based risk behaviors, attitudes, and knowledge.

- E.641** SEX EDUCATION: AN IMPORTANT ELEMENT OF AIDS EDUCATION
 "Centro de Pesquisas em Planejamento-AIDS, Sao Paulo, Brazil
 Diana Brakley"

Objectives: To describe a sex education curriculum that has been used as part of an AIDS education program in Brazil. **Methods:** A human sexuality curriculum was tested as a part of a training program on AIDS for 9 different groups of professionals: teachers, health care professionals, mental health professionals, social workers, human resource professionals of the private industry, professionals that work with abandoned children, general population, and sexual workers (male, female and transverse prostitutes). The curriculum is divided in four parts: a) Values clarification b) Basic information on human sexuality c) Specific information on human sexuality (AIDS related) and d) Specific strategies for each group depending on their needs and interests. **Results:** Sex education proved to be an important element in preparing the groups for the information on AIDS. This was especially true for the religious leaders (of 17 different religions) and sexual workers. **Conclusions:** a) The lack of knowledge about sexual behavior brings about misconceptions and fears that interfere with the transmission of facts about AIDS. b) Sex education is a necessary element of AIDS education.

- E.643** THE "THREE-FOR-FREE" PROGRAM: A STATISTICAL DENSIFICATION PROGRAM IN HARTFORD, U.S.A.
 Wondolowski, J., Bonaguidi, M.,* Clark, Samuel,** Gidycz, Anne,** Johnson, Pam,** Wiley, Andrew**
 *AIDS Administration, Department of Health, Baltimore, MD, USA **Division of Family Planning, MD Department of Health, Baltimore, MD, USA.

Objectives: Describe key components leading to the successful, rapid expansion of a Statistia Agency program which distributed over 1.6 million condoms annually from over 540 sites sponsored by over 170 agencies. **Methods:** Internal measures and self-administered questionnaires. **Results:** Since 1983 the Maryland State Health Department's Division of Family Planning had the objective of decreasing barriers to condom use by making free condoms available for anonymous pick-up at as many sites as possible. Statistia, in close interagency cooperation with the Administration, the rate of expansion over the last two years has been exponential.

Year	# Condoms Requested	Picked Up	# Dispensers	# Sites
1986	1,750	74	32	32
1987	571,515	52	164	164
1988	1,600,000	25	330	330

* (Provisional) Same reporting for first three quarters of 1989)
Conclusions: The Three-for-Free Program is a highly effective method of expanding access to condoms among high risk populations. With an average annual cost per active client of less than \$10.00 per year, the Three-for-Free program is an effective model for preventive community outreach based on interagency cooperation.

- E.640** A DEVELOPMENTAL APPROACH TO AIDS/IV EDUCATION
 Cooledge, A.,* Sages*, Sheets, R.,* Lindsay, L.,* Harris, V.,** ST, F.,** and Roberts, R.*
 *Vanderbilt University, Nashville, Tennessee, USA, **Harvey Medical College, Nashville, Tennessee, USA, ***University of South Carolina, Columbia, South Carolina, USA

Objectives: To plan and pilot a systematic developmental approach to AIDS/IV education in a variety of settings with different population groups. **Methods:** 1) Analysis of developmental education literature; 2) establish a needs assessment system which can detect population-specific issues of age, core AIDS/IV content for use across settings and populations; 3) design a needs assessment system in four settings with differing population groups (gay males, heterosexual youth in public school, employees of a conservative religious organization, and black participants of an AIDS training session); 4) for each setting, develop a curriculum consisting of the core AIDS/IV content and the specific results of the needs assessment with emphasis placed on the developmental stage of the group's knowledge and attitude towards AIDS/IV; and 5) pilot and evaluate the developed group-specific curricula. **Results:** Sensitivity to group-specific issues increased the motivational level of participants towards AIDS/IV. **Conclusions:** Assessing the group-specific needs of any AIDS/IV education population group, with emphasis on the group's perceptions of need and further development, will increase the likelihood of program success.

- E.642** AIDS Inside and Out: A National Education Programme For Prisoners in England and Wales

GURRAN Len*, GALLWEY J**, CRIGHAM J***, KILGOUR J**, HILLES D****, THORNTON D****

- ** HM Home Office, London England ** Jeddiffe's Infirmary Oxford, England
 *** The Landmark, London England **** Director, Prison Medical Service, London, England
 **** World Health Organisation, Geneva, Switzerland
 ***** Adult Offender Unit, HM Prison Service, London, England

Objective: To describe the design, implementation and evaluation of a national education programme for prisoners in England and Wales on AIDS and HIV.

Method: An advisory committee composed of outside and independent experts on AIDS and HIV and experienced prison staff produced an education package consisting of a 20 minute video, manual for tutors and 2 leaflets. The elements were based on research surveys of inmate fears and attitudes regarding AIDS/HIV. The video film was shot on location in prisons in England and Wales and directly addresses the concerns and fears expressed by prison inmates. **Results:** to be discussed.

- E.644** REVISIONS AND IMPLEMENTATION A.I.D.S. EDUCATION FOR STUDENTS AND THE GENERAL PUBLIC IN A SMALL WESTERN COUNTRY

R.L. Sattler, R.L.J. Jones E. Surin : Richmond County District Health Unit, Ontario, CANADA

Objective: To present factual, objective and representative data to persons at risk in a typical rural West Scottish community. Describe the low incidence and prevalence rates for A.I.D. infection. The degree of promiscuity and illegitimate births observed preceded estimates of high risk behavior with few or no identified A.I.D. cases. A multi-disciplinary committee was formed to represent the target population and the community as a whole; policy and educational programs were designed to represent the most current information available.

Methods: Further review of the population received between three and six hours of intensive material delivered in a multimedia presentation. Currently one hundred and sixty slide III grading stations were targeted for slide hours of class time over a three day period. A standardized protocol was administered to determine the level of knowledge; a standardized self test was administered one year later.

Conclusions: Behavior among the youth of the community appeared to be attracted and subject to intense peer pressure. The presentation of facts, current and relevant data is not enough to alter high risk behavior. A.I.D.s. education as it is presently taught will be ineffective in reducing the incidence of A.I.D. unless behavior is altered. Youth have identified parents and the medical profession as their best source of information however, when tested that information does not alter high risk behavior. We conclude that the approach may be more valid in the context of the society in which we live while preventing, emphasizing, up to date and factual information.

EDUCATING THE PUBLIC ABOUT AIDS IN LIMA, PERU

Luis A. ~~Manuel~~, Saba, Walter###, Varela, Luis###, Payne, Alice###, Peruvian Health Ministry, Lima, Peru, ##Population Council, Mexico, ###The Johns Hopkins University/Population Communication Services, Baltimore, Maryland, USA.

Objective: To develop an AIDS mass media information campaign for the city of Lima, Peru.

Methods: Five steps were followed to develop an information campaign: 1) an audience analysis carried out through focus groups and a survey of 1,900 households; 2) design of 3 TV and 2 radio spots; 3) pre-testing of materials in the target population; 4) production of spots; and, 5) dissemination through TV channels and radio stations.

Results: Audience analysis showed high public awareness about AIDS but a low prevalence of preventative behaviours. Also, great interest on the subject overrode any objections to the use of mass media to promote safer sex, condom use included. Testing of materials showed identification, acceptance and a good comprehension of preventative messages. **Conclusions:** Audience analysis and pre-testing were crucial to determine content and format of the AIDS education campaign.

E.646

ISSUES IN THE EVALUATION OF AIDS EDUCATION PROGRAMS: THE CALIFORNIA EXPERIENCE

Jung, Michael, Moore, M., Forst, M., The USA Institute, San Francisco, California, United States.

Objective: To discuss the results and some of the critical issues in the evaluation of AIDS education programs in California. **Methods:** All 87 of the state-funded community education and prevention programs for fiscal year 1987-88 were evaluated. Interviews were conducted with program directors and key program staff. All relevant educational testing materials were collected and analyzed.

Results: All of the programs met the objectives they had contracted to achieve. Specifically, programs reached the specified number of adult clients and those clients achieved the requisite level of educational competency regarding AIDS transmission and prevention. However, several problems were uncovered that cast doubt on the effectiveness of the programs to alter clients' attitudes and behaviors. These problems related to evaluation design, test construction, test administration, and data analysis.

Conclusion: Most target groups reached by the educational interventions have achieved minimal levels of educational competency about AIDS transmission and prevention, and contracted program objectives were met. The state's program must move beyond emphasis on cognitive knowledge about HIV transmission and prevention and begin to stress interventions concerning, and evaluation based on, attitude and behavior change.

E.647

EDUCATIONAL PROGRAMS ON AIDS - PEOPLE'S REACTION IN DELHI, INDIA. Dr. Neelam Kishore, Health Education Bureau, Dts.General of Health Services, New Delhi, India.

Objective: To study people's reaction to the educational programs on AIDS launched by the Govt. through television, radio and newspapers.

Method: One Hundred Four patients of Sexually Transmitted Diseases and 37 Blood Donors randomly selected from three Govt. Hospitals in Delhi were covered. Only 70 individual, who were exposed to the programs were interviewed with a set of closed and open questions.

Results: Among all channels, television was rated as the most effective to inform the public about the disease. Most of the respondents found it of relevant appropriate, but the duration was considered to be short-lived to comprehend various aspects of the disease. Very few acquired correct knowledge on mode of transmission, incubation period; and symptoms. On the other hand, many of the respondents acquired correct knowledge on preventive measures-avoiding extramarital and homosexual contact. The educational campaign did create fear among the public regarding blood donation. This contributed a disturbing drop in the number of blood donors. The blood donor respondents were frightened for donating blood for the fear of contracting AIDS by sharing common needle used for blood donation.

E.648

AIDS AWARENESS AMONG COLLEGE STUDENTS IN INDIA.

Verma, Shankar and Parul Dhandekar, *Incharge Computer Section, National Institute, Pirbright, Pune, India. **Project Director, ICOR Centre for AIDS Research and Control (CANC), Pune, India.

Objective: To assess knowledge about AIDS among college students of a metropolitan city, Bombay, and a provincial city, Pune, both in Maharashtra state.

Methods: CANC carried out a limited questionnaire survey in October 1988. Anonymity was maintained and questions regarding personal sexual behaviour were avoided. Information was computerized for comparative analysis.

Results: A significantly higher percentage of Bombay students (62%) responded as compared to only 21.3% from Pune (p<0.05). About 77% of Bombay students compared to Pune ones indicated foreign magazines as the major source of information (p<0.01). In contrast, 60% of Pune and 33% of Bombay students had marked Indian newspaper/magazines as a major source (p<0.05). Overall, all students depicted monogamous relationship. However, 51% of Bombay students as compared to 25% of students from Pune were aware of condoms for safe sex (p<0.05). There were a few misconceptions regarding transmission of HIV infection, e.g. 24% of students considered toilet seats to play a role in transmission. There were also several misconceptions concerning transmission through blood transfusion. This and subsequent surveys are presented.

Conclusion: The questionnaire survey though limited, establishes its usefulness in formulating health information programmes and indicates the need for a wider survey in different regions.

E.649

SEXUAL BEHAVIOUR OF UNIVERSITY STUDENTS

RESULTS FROM A PILOT STUDY

H.Laatz*, J. Papp*, F.-D.Goshe*

*FD Dr. H. Laatz, J. Papp, STATION Medizinische Forschungsgemeinschaft mbH, Bismarckstrasse 12, FRG - 8033 Pasing

**Prof. Dr. F.-D. Goshe, Medizinische Poliklinik der Universität München, Paterhoferstrasse 16, FRG - 8000 München 2

As an exact understanding of the actual sexual behaviour of a population is essential for predicting the speed and the direction of the spread of AIDS. In our survey 358 students of medicine and psychology were given a detailed anonymous questionnaire about their sexual activities and attitudes. 84% of the students (307) returned the questionnaire. The results revealed that 19% had more than one sexual partner during the preceding three months. Anal intercourse was reported by 35/307 (11.4%). A large proportion of the students was reluctant to using condoms for various reasons. E.g. 42% (129/307) saw no indication for using condoms although 18 of them had reported sexual contacts to more than one sex partner during the preceding three months including two students who had practiced anal intercourse.

We conclude that more specific concentration on young, sexually active subgroups of the population and their needs is mandatory. Our results indicate that knowledge of even medical students is not sufficiently reflected by avoiding risky sexual behaviour.

E.650

STUDY OF THE ATTITUDES AND INDIVIDUAL FACTORS OF SELECTED EGYPTIAN WOMEN TOWARDS AIDS

*Director The Arab Centre for Fighting Against AIDS, Cairo, Egypt

Objective: This study is to measure cognitive knowledge of selected groups of the Egyptian population about the AIDS problem and to assess the attitudes, if any, of the attitudes and behaviours of the groups studied as a result of their knowledge.

Methods: The AIDS problem and to assess the attitudes, if any, of the attitudes and behaviours of the groups studied as a result of their knowledge. The study included and questioned by five (5) questions, the [1] tested their knowledge and the last 1 to assess any change of the attitudes related to the AIDS transmission. The 100 persons included consisted of females on vice offences, the 2nd group (40 persons) of drug offenders, the 3rd (50 persons) consisted of young university students and the 4th (50 persons) consisted of workers in tourism industry. The common denomination in these groups is that they are particularly vulnerable either because of drug practices or active sexual lives or contact with foreigners.

Results: are outlined the following table.

FACTORS IN SHORT STATEMENT	Mean of the score of the return		Type of the score		Change of practices		Change of attitudes	
	100	0	100	0	100	0	100	0
Number of sexual partners	400	320	80	20	80	20	80	20
Use of condom	600	60	10	90	10	90	10	90
Anal intercourse	500	50	10	90	10	90	10	90
Sexual Intercourse	500	50	10	90	10	90	10	90

n.s. = not significant, * = significant. The study showed that the relatively educated Egyptians are better informed about HIV disease than those less educated who are at even greater risk. In all the groups studied the impact on the change of behaviour is not great. The study showed that selective campaigning targeted at the more vulnerable groups is needed.

Le SIDA, la société et le comportement
AIDS, Society and Behaviour

- E.657** MILIEU SCHOLAIRE ET PROBLÉMATIQUE DU SIDA
Michèle MANTION, Bruno BONIFACE, Bernard DUMÉZIL**
 ** ASSOCIATION DES JEUNES CONTRE LE SIDA - AJS
 ** UNION DES SOCIÉTÉS ÉTUDIANTES NÉOULTRAIÈRES - U.S.E.N., FRANCE

OBJECTIFS: Connaître les structures officielles de l'Éducation Nationale d'organiser des séances de prévention du SIDA dans les lycées et collèges par des intervenants extérieurs formés pour cela avec un matériel adapté.

MÉTROLOGIE: Après plus de 200 interventions spontanées en 1988, sur les demandes des enseignants, des infirmières scolaires, des parents et des jeunes, avec des documents spécifiques (vidéos et brochures), l'AJS a pu effectuer un travail de pression auprès des autorités de l'Éducation, des parents d'élèves et de la presse pour généraliser ces actions.

RÉSULTATS: La seconde étape est aujourd'hui avancée. Les interventions jusqu'aux écoles, s'officialisent. Les demandes émanent des médecins scolaires, des chefs d'établissement et des autorités locales (rectorats).

CONCLUSION: Les réticences du milieu scolaire et de la communauté éducative à accepter des interventions extérieures ont été levées en douceur par une persuasion basée sur la confiance et la réponse aux besoins exprimés par les jeunes sur leurs demandes.

Les associations ont un rôle précurseur de première importance, tant par la collaboration avec les partenaires que pour la conception des programmes.

- E.658** IMPLEMENTING AIDS EDUCATION INTO THE CURRICULUM IN N. IRELAND
O'Donnell P. James, Kibben M. P. J. UNITED KINGDOM

Objective: To explore the feasibility of joint health and education initiatives to introduce AIDS education into the secondary school sector in N. Ireland. This initiative occurred against a background of a conservative culture, a school system dominated by religious teaching and a reported antagonism towards homosexuality. There were no standardized sex education programmes in schools and in addition N. Ireland is an area with a low level of drug misuse and a low prevalence of HIV infection and AIDS.

Methods: An interdisciplinary approach was adopted in this initiative involving collaboration in a consultative process between health and education sectors, and the formation of a joint team to produce suitable health promotional materials.

Results: Unprecedented attendance for in-service training and use of material occurred in N. Ireland with some 76% of post primary schools in the Eastern Health and Social Services Board having one or more teachers trained in the programme. Further uptake occurred from schools for children with special needs and colleges of further education.

Conclusion: It is possible to implement AIDS schools prevention programmes even in a conservative and unfavourable climate in a population with low prevalence. The programme was successful because of the way in which this was achieved and the vital components of the programme.

- E.659** "AIDS EDUCATION OR PSYCHIATRIC INTERVENTIONS"
Patience Jeteroli, Peyton, L., McGill, C. U.S.A.

Most health care organizations have emphasized the vital importance of AIDS education for the general public. The AIDS policy for inpatient psychiatric units developed by the American Psychiatric Association addresses briefly the topic of AIDS education, recommending appropriate counseling for patients and staff. The rationale for educating psychiatric inpatients includes: eliminating HIV-related risk behaviors reported by psychiatric patients, addressing the needs of the increasing number of patients with AIDS hospitalized on psychiatric units, reducing fears and prejudice among patients and staff, and fulfilling a responsibility as health professionals to provide patients with information about HIV. We are presenting two models of AIDS education that target adult and adolescent psychiatric inpatients. The models are tailored to four psychiatric units affiliated with the University of California, San Francisco. Each unit takes into account patient sociodemographic characteristics, level of psychiatric impairment and HIV-related risk behaviors. Descriptions of clinical interventions for the different models are presented.

- E.660** PERFORMANCE STANDARDS FOR THE DEVELOPMENT AND EVALUATION OF SCHOOL HIV/AIDS EDUCATION CURRICULA FOR ADOLESCENTS
Tarber, William L., and Terabi, Mohamed R. U.S.A.

Objective: Most U.S. schools provide HIV/AIDS instruction for adolescents and either (1) utilize outside curricula, or (2) develop their own curriculum. Performance standards against which current curricula can be evaluated or new curricula can be developed are needed. This paper describes the development of a performance standards checklist.

Methods: Professional literature and health experts were used in developing the performance standards. Particular attention was centered on suggested content and pedagogical approach, including learning and instructional theory. A list of standards or evaluative criteria was generated, and arranged on paper as a checklist.

Results: It was determined that the most ideal curriculum would have both the student and teacher guides. Seventy-two specific performance standards were generated for both guides. The student guide had ten major components: nature of HIV/AIDS, impact of AIDS, HIV transmission, individual HIV prevention, HIV control efforts, learning enhancement, learning domains approach, verbal quality, visual aesthetics, and tone of message. The teacher guide had six major components: HIV/AIDS school education, implementing the curriculum, learning activities, handouts, evaluation, and educator/instructor sources. **Conclusion:** Specific performance standards for school HIV/AIDS education curricula for adolescents can be generated and can assist educators in (1) determining the specific strengths and weaknesses of existing curricula, and (2) developing new curricula. Educators are encouraged to utilize the performance standards checklist for both of these tasks.

- E.661** FACE-TO-FACE: INTERACTING PERSONS WITH AIDS INTO ADOLESCENT AIDS PREVENTION EDUCATION

Cronston, E. A., Tates, R. W., Wright, S. W.

**Massachusetts Department of Education, Quincy, Massachusetts, USA, **Health Care of Southeastern Massachusetts, Abington, Massachusetts, USA

Objective: To enhance the impact of AIDS prevention education efforts on adolescent audiences in public schools.

Methods: Persons with AIDS were recruited, screened, trained and fully integrated into a four-session AIDS prevention education module. Difficulties of community and staff resistance, parental approval, logistics and the limited personal resources of the persons with AIDS involved in the program were addressed. The person with AIDS presentation was preceded by two sessions on basic information and effective education about AIDS, and was followed by one session of emotional feedback from students.

Results: Anecdotal reports from educational faculty indicate that this format powerfully affects the attitudes and awareness of students. This may translate into true behavior change.

Conclusion: This model of AIDS prevention education may be easily replicated by other educational systems with minor modifications.

- E.662** AIDS PREVENTION FOR ADOLESCENTS IN SCHOOL: DO SCHOOL PRINCIPALS PERCEIVE THE NEED?

Guterman, E.M., Walker, Heather J., Beach, G.E., Glantz, M. and Ehrhardt, A.A. HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute & Columbia University, New York, New York, USA

Objective: The long-term goal of the project is to implement and subsequently evaluate an AIDS prevention program in the high schools which will broadly modify the behaviors that place students at risk for acquiring HIV. The school setting maximizes access to the adolescent population, but poses a host of challenges since a good fit between needs of the program and the school must be achieved. To determine the desirability of AIDS education, our first step was to target principals, the prime decision-making group within the schools.

Methods: In June, 1988, an interview containing open-ended and structured items was administered by telephone to principals (or other high ranking school personnel) in Manhattan and Rockland County high schools.

Results: Our surveys indicate that principals view AIDS prevention as a high curriculum priority. There was total consensus that the goals of a school AIDS prevention program should include knowledge, attitudinal change, and drug abstinence goals. There was less agreement regarding the promotion of behavior change related to sexual abstinence and safer sex.

Conclusion: Principals generally concur with the need for an AIDS education program that would target knowledge, attitudes, and behavior. The commitment to AIDS education among teachers, parents, and students will be surveyed next.

Publications

Le SIDA, la société et le comportement
AIDS, Society and Behaviour**E. 663** AIDS AND THE MEANS OF COMMUNICATION: FROM HIGH RISK GROUPS TO HIGH RISK FACTORS; FROM HIGH RISK FACTORS TO AN UNDERSTANDING OF THE VIRUS.

Frederico C. Conde, F., Coronado, A., Gil, E., et al.

Ministry of Health-Spain.

Objective. The manner in which AIDS and the AIDS problem has been put across to the general public has gone through several phases since the discovery of the virus in the early 80's. The major source of information has been the media-scientific world and though the stress has changed from the defining medical-scientific world to the present emphasis on high risk factors, AIDS has been and is still understood in pure epidemiological terms.

Conclusion. This paper analyses these sources of information, their underlying factors and proposes an alternative scientific discourse which would bring clear information on the transmission of the virus, a better understanding of this process and help change the ever increasing "quarantine" mentality towards the people afflicted with AIDS.

E. 664 HEALTH AND MEDICAL APPRENTICESHIP PROGRAM OF AIDS RESEARCH

Clayton Gonzalez, II, War Immunological Network, Los Angeles, California, USA, Treasurer.

Objective. The health and medical apprenticeship program is designed to provide a support network to assist students and community members in the dissemination of AIDS information.

Methods. This group research project will examine technical, social, political and economic aspects of the global HIV epidemic. The goal of the project is to produce a portion of an accurate, current information resource for use by AIDS educators and the general public.

Results. It will provide training and prepare students and community members who are aware of the inner-workings of AIDS research and facilities.

Conclusion. There is a demonstrated need for an apprenticeship program where interested students and community members can learn first-hand the inner workings of research. In this way they will have been trained in many of the fundamentals, as well as exposing them to a field of work in which they have expressed interest. In this way the end product would be dedicated professionals entering the field with prior knowledge and therefore confidence in their ability to meet the needs of AIDS research.

E. 665 EDUCATIONAL AND TRAINING STRATEGIES IN SÃO PAULO STATE, BRAZIL.

Roberto H. L. Eisinger, E. Ferreira A.C.; Grandi J. J. Abad, M. S.

Centro de Referência e Treinamento em Aids - São Paulo, Brazil.

The state of São Paulo, Brazil, has a population of 33 million. From 1980 until December 1988, 3213 AIDS cases were reported to the Health department.

In 1987 was organized the first massive Campaign with 12 million pamphlets, 1.5 million posters, 4,5000 billboards, 100,000 guidelines for infection control, 4 videos for TV, 4 spots for radio.

Apart from the massive programs and Campaigns the Educational and Training UNIT on Aids, from secretary of Health, developed strategies of training health care providers and community leaders in order to be those who will train and inform others.

During 1988 we trained 2100 community leaders to give Aids in information in the front-line.

Conclusion: The person to person information on Aids is most effective way of prevention especially in our region which is full of contrasts of all sorts cultural, educational, economical and Social.

E. 666 EFFECTS OF AN EDUCATIONAL CAMPAIGN TO REDUCE BLOOD TRANSFUSIONS IN CHILDREN IN KINSHASA, ZAIRE

Theresa E. Borch, M.D., M.P.H., *Harvard, B. and *Henn, J.M. Department of Pediatrics, Henn Veno Hospital, **Ministry of Health, Kinshasa, Zaire and *MO, Geneva, Switzerland.

Objective. To evaluate the effectiveness of an educational campaign to reduce the number of blood transfusions and thereby reduce the transmission of AIDS.

Methods. An investigation carried out at the Department of Pediatrics revealed that malaria induced anemia was the major cause of transfusion. Nevertheless, children with a hemoglobin as high as 11 gm had been referred for transfusion to the Satrien Society of Pediatrics, for the faculty and housestaff and guidelines were set. Based on seroepidemiological evaluation, transfusion was reserved for children with a hgb. of less than 5 gm if there were signs of hemolytic anemia. In addition, an HIV screening unit was installed at the blood bank.

Results: Dramatic results followed the campaign. There was a 72% decrease in the number of transfusions from 30,302 in 1986 to 8,531 in 1987 with no increase in mortality. Transmission of other endemic infections such as malaria, cytomegalovirus and hepatitis B were proportionately reduced.

Conclusion: A worldwide educational campaign is required to reduce the number of unnecessary transfusions. This coupled with HIV screening tests prevents the risk of HIV transmission by this route.

E. 667 PATIENT OPINIONS ABOUT DENITISTS AS AIDS EDUCATORS.

Geoffrey Magnus Maguire, B. Sumner J. and Spitzer, S. University of California at San Francisco, California, United States.

Objective. There has been little discussion about whether dentists would be appropriate disseminators of HIV information. We wanted to determine if patients would accept dentists as HIV educators and if they experienced dentists acting in this role as part of their response to the HIV epidemic.

Methods. Telephone interviews were conducted in July and August 1988 with 2000 English-speaking, United States adults, using a representative national sample generated by random digit dialling. The response rate was 79%. The denominator for the data reported below is all those who have received dental care in the past five years (n=1212; 91% of sample).

Results. Only 12% of the respondents had discussed AIDS with their dentist; in 80% of these cases, the conversation was started by the patient rather than the dentist. Twenty-one percent of respondents wanted to discuss AIDS, 49% did not care, and just 30% would prefer not to talk about it. A majority of patients were "very" or "mostly" comfortable with the idea of discussing AIDS (88%) or intravenous drug use (80%) with their dentist, but a minority (45%) felt that way about discussing their sexual behavior. Of those who were willing to discuss AIDS, 35% believed patients themselves should start the conversation; the rest thought the dentist should (33%) or that it did not matter who began the conversation (32%).

Conclusion. These data show that dental patients are willing to see their dentists as information resources concerning HIV. On the topic of sexual behavior, however, patients were more reticent. We believe patients would be more receptive to dentists providing patients with educational information on HIV and suggest that dentists initiate such discussions with patients.

E. 668 A MODEL HIV EDUCATION/PREVENTION PROGRAM FOR A PREPAID HEALTH PLAN

Neil A. M.D., Caseo, W. Ph.D., **Southern California Permanente Medical Group, Harbor City, California, USA. **Kaiser Permanente Medical Care Program, Oakland, California, USA.

The Kaiser Permanente Medical Care Program is a group practice prepaid health plan with approximately five million members in twelve regions of the United States. A three-regional (nation-wide) AIDS committee has been formed to respond to and plan for issues that the AIDS epidemic present to complex health care systems like ours. The Education and Counseling Subcommittee has developed a model program to educate, reduce fear, and overcome denial; to allow our employees, physicians, and members to prevent the transmission of HIV; and to deal most effectively and humanely with the AIDS epidemic.

Three specific populations have been targeted for education and counseling: 1. Kaiser Permanente employees and providers (including physicians). 2. The general patient membership. 3. Patients and employees who practice behaviors that put them at risk for HIV infection.

A four-step process for AIDS prevention in the context of ambulatory health care will be presented:

1. Identifying members who practice high-risk behavior.
2. Providing same day information.
3. Providing risk reduction education.
4. Implementing risk reduction counseling programs aimed at gay and bisexual men, IV drug users and their steady sexual partners, hemophiliacs and their steady sexual partners, adolescents, and the steady sexual partners of anyone who is infected with HIV.

EVALUATION OF THE IMPACT OF AIDS EDUCATION
 SWHARTZ, R.L.; SANDERS, R.J.; KRIDER, L.J.; BIANCHI, F.B.
 American Red Cross and Navy Environmental and Preventive
 Medicine Unit, Naples, Italy.

Objective: The potential severity of HIV infection has demanded aggressive intensive and effective educational programs to limit the spread of disease. This study evaluated the level of knowledge concerning HIV transmission factors in a diverse overseas American community, and established a methodology to evaluate which educational activities could result in modification of high risk behavior.

Methods: An educational program was designed to present information on the HIV epidemic. Prior to and immediately following the program, a questionnaire was administered to assess levels of awareness concerning transmission and non-transmission factors for the HIV virus.

Results: The study group (137 predominantly young (20-30 year old) individuals) were all users of the principal transmission factors; however, 70% had significant misconceptions related to the infection and disease process, including blood donation (28%), insect bites (22%), and fingering (32%). Initial data indicate that certain channels of communication are preferred by population subgroups and specific formats are more likely to improve levels of knowledge and actually result in changes in behavior.

Conclusion: While the majority of persons are aware of the transmission factors related to HIV, a significant number of individuals provided misinformation. Educational program must be developed to provide sufficient, comprehensive information targeted to specific groups to result in behavior modification, and evaluated in document effectiveness.

E.671

CORRECT CONDOM USE: AN ASSESSMENT AND INTERVENTION STUDY AMONG SEXUALLY ACTIVE MEN IN TRINIDAD AND TOBAGO,

WOODS, WILLIAM, J.; CLEGGON, F. **; MAHABIR, B. ***; HOLLOWAY, M. **
 *AIDSICON, Washington, D.C.; ** Caribbean Epidemiology Centre, Trinidad and Tobago
 *** Queens Park Counseling Centre and Clinic, Trinidad and Tobago.

Objective: To assess the degree of correct condom use among sexually active heterosexual, bisexual, and homosexual men in Trinidad and Tobago and to compare different approaches to teaching correct use.

Methods: Contact investigators at an urban STD clinic invited 200 male clients to participate voluntarily in a condom use study. Selection based on client availability. An initial assessment of knowledge and use of condoms was followed by 1 of 2 interventions and an immediate post-test. Intervention 1 had the interviewer model correct condom use with a surrogate object and #2 involved providing a brochure with pictorial explanations of condom use procedures.

Results: Study in progress but pilot study indicated men knew basic about putting condoms on but were clear about important ways to avoid condom breakage. Interventions with immediate consultation helped increase skills considerably.

Conclusion: Clients at risk for STD may improve and sustain building for correct condom use. Which teaching intervention proves more effective remains uncertain; this study may help indicate whether mass produced and distributed "how to use condoms" brochures are useful for increasing correct condom use.

E.673

LE CENTRE REGIONAL D'INFORMATION ET DE PREVENTION SIDA (CRIPS), PARIS
 JACQUES, L., DR. JACQUES, L., FRANCE

*CRIPS
 *Observatoire Régional de Santé

Objectif: Centre de conseil pour la prévention du SIDA en Île-de-France destiné aux professionnels de la santé et de l'éducation. Lieu d'échange pour le VII en Europe. Une initiative de Conseil Régional de l'Île-de-France - métropolitaine. A. renseignements, publiques ou privées, métropolitaine sans la région.

1. renseignements par téléphone, documentation sur la prévention (en collaboration avec DCL Belgique) ceux qui sont dans des projets de prévention.

2. Centre des formations pilotes

3. Depuis son ouverture en novembre 1988

4. La documentation représente plus de 1.000 références indexées accessibles à distance et 100 films vidéo.

5. La lecture du CRIPS est adressée directement aux professionnels.

6. des formations pilotes pour des centres de dépistage HIV, éducation préventive universitaires, FFP, policiers, etc.

7. des formations pilotes pour des centres de dépistage HIV, éducation préventive universitaires, FFP, policiers, etc.

8. Le CRIPS est une structure pluri-partite-publique. Lieu de rencontre pour les associations et les professionnels, destiné à favoriser les initiatives et la circulation de l'information.

E.670 CONDOM USE ASSESSMENT AND INTERVENTION STUDY: A NEW TOOL FOR CONDOM PROMOTION

Salish, William*, Paraja, Nayindoo**; *AIDSICON, Washington, D.C.; **AIDSICON, Dominican Republic

Objective: To determine level of correct application and removal of condoms among targeted populations.

Methodology: Using an observation protocol respondents are asked to place on a surrogate object a condom. The researcher, through observation, records data about placement and removal, noting such items as how package opened, whether/how condom unwound, whether condom breaks due to respondent error etc. Observation protocol is followed by brief RAP Survey.

Results: Findings indicate 60% indicate that basic training in the fundamentals of correct placement and removal are required. The materials are developed to encourage condom use.

Conclusion: The materials are developed to encourage condom use, a return to basic knowledge gathering may be called for. The procedures in universal, may require further exploration.

E.672

THE ORIENTATION OF LIFE: THE BASIC GUIDING PRINCIPLES FOR AIDS PREVENTION IN THE DOMINICAN REPUBLIC

De Moya, E., Antonio, Guerrero, E.; Belliard, M; Peña, G.; Garcia, L.; Dominguez, L.
 PRCTC, Ministry of Public Health, Santo Domingo, Dominican Republic.

Objective: To present the ten basic guiding principles for AIDS prevention developed by PRCTC, and to analyze the supporting empirical evidence accumulated from 1985.

Methods: Principles are discussed together with the main supporting findings derived from CAP studies and educational research.

Results: Key principles that have proven effective for AIDS prevention are: 1) Enhance the target-audience's self esteem; 2) Speak to the heart of the targets; 3) Emphasize the value of health, love and life; 4) Increase awareness of one sexual contact infectiousness; 5) Promote a high perception of the preventive value of condom use; 6) Educate the population about other STD; 7) Insist on mother-infant transmission; 8) Keep high levels of perceived threat of AIDS in women and low levels in men; 9) Create awareness of individual responsibility for contagion; 10) Always speak of hope, joy of life and power to control AIDS.

Conclusion: High standards of acceptance and responsiveness to the program - have been reached through an approach that deemphasizes disease and death - while promoting health, love and life.

E.674

WORLD AIDS DAY ACTIVITIES AND THEIR SIGNIFICANCE FOR AIDS PREVENTION IN CATALUNYA

Wölfeliler, Demí* Segura, M** Prouzet, A.** FRANCE

Objective: To Initiate World AIDS Day activities in Catalonia, and determine their significance for future AIDS prevention efforts.

Method: The government, Church, citizens' organizations and mass-media all actively participated in World AIDS Day activities. These included distributing information, releasing balloons to commemorate those who had died of AIDS, a condom party at a gay discotheque, and documentary and feature film premieres at local cinemas. Restaurants, religious and gay media gave extensive coverage with features and scientific articles. Direct advertising was kept to a minimum.

Results: This was the first time a multisectoral AIDS prevention effort took place in Catalonia. Success would have been enhanced by instituting a coordinating team. Potential new community opinion leaders were identified and recruited. By focusing on media coverage, costs were kept low.

Conclusion: World AIDS Day provides an opportunity for education and coalition building among otherwise unaffiliated members of the community. It also serves to identify community participants necessary to maintain high levels of AIDS awareness throughout the year.

- E.675** THE NEED FOR PSYCHOSOCIAL EMPHASIS IN ACADEMIC COURSES ON AIDS
Ziffo, Albert S. and Ziffer, J.*
*Rollins College, Winter Park, Florida 32789, U.S.A.
- Hypothesis:** Although the number of educational programs concerning AIDS has multiplied significantly during the past 3 years, frequently more attention is paid to the epidemiology and clinical aspects of the disease rather than the psychosocial issues which need equal or greater emphasis.
- Method:** To evaluate this premise pre/post tests on attitudes were administered to two groups of students enrolled in one semester, intensive courses on AIDS. One course taught only facts and the other taught facts, values clarification, and attitudinal change of attitudes.
- Results:** The course in which medical and psychosocial aspects of AIDS are emphasized resulted in significant attitudinal change among the students. The post course questionnaires revealed a markedly more ethically responsible and compassionate attitude toward persons with AIDS than existed prior to the course. The course which taught only facts resulted in no statistically significant attitudinal change.
- Conclusion:** If academic courses on AIDS are to be effective in disseminating information and in increasing compassion and reducing biases of students, then the teaching model for such course work must address the psychosocial issues as well as the scientific facts.

- E.676** EVALUATION OF THE HIV SPONSORED TRAINING OF TRAINERS PROGRAM ON AIDS AND THE IV DRUG USER

Ashery, Rebecca S.
National Institute on Drug Abuse, Rockville, Maryland USA

Objective: The purpose of the study was to conduct a follow up evaluation on the HIV train the trainers (TOT) program on how to deliver the HIV/AIDS curriculum to drug treatment personnel.

Methods: A mail questionnaire was sent to participants of 16 TOT workshops conducted for selected individuals from 14 states and the District of Columbia. The self administered questionnaire was designed to assess the usefulness of the training, the extent to which it increased their skills in specific areas and their AIDS training activities since the TOT and additional technical assistance needed from HIV.

Results: Out of 160 respondents 93% indicated that the overall effectiveness of the TOT course was excellent or good. Nearly 75% of the respondents had delivered training in the six months after they had received the TOT. Less than 20% of the respondents followed the HIV curriculum exactly, changing either the time schedule or adding and deleting units.

Conclusion: It was estimated that 16,500 people had received some training by graduates of the HIV TOT workshops. By most factors considered in the survey, the TOT program is considered a success.

- E.677** PAR ANCIEN AND BOOK TACTIC TO REDY WORK

Leslie Ray - St. Mary's Hospital/Johnson Dist. UNITED KINGDOM

Objective: To evaluate the use of film-visual in AIDS campaigns.

Introduction: Four annual film behavior change has little recorded success. The Dist. Health Education Campaign on AIDS used four messages targeted at spread via contaminated needles. Is four annual effective? If not is this because the recipients are not motivated (4 hours greater film would be looked) or is the technique based on disease theory and of limited use (4 hours should be shortened)?

- Method:** 111 subjects (52 consecutive drug dependent (all attendees in the area of highest U.K. HIV incidence & 59 attendees in the same area) had recently used, shared, pre and post exposure to the posters (visual) and television screens (audio-visual) material to monitor activity change. Attitudes, drug using and sexual behaviour and perceived personal risk was monitored.
- Results:** The DVD group were significantly more active than students (p<0.01) as a group. Few messages significantly increased in attitudes (4-3, 10 p<0.001) but had no impact on drug users. Visual and audio-visual material was inconsequential in contributing to the effect. Drug users were less likely to react actively as realists. Likelihood of changing sexual behaviour was low for both groups (4) had multiple sexual partners in the preceding six months). Perceived personal risk was low (25% DV and 20% DV felt at no risk). Few students thought the message was used at times. Both were worried about AIDS (over 3,5 and 4,1 on 7pt scale).
- Conclusion:** Four annual has limited use.

- E.678** REV COUNSELLING AND TESTING IN REDUCED MEDICAL PRACTICE IN NEW JERSEY
Ong, Philip*, Barkan, E., Hyllingstad, A., Preved, J., Oates, S., Pincus, J.

New Jersey State Department of Health, Trenton, New Jersey, USA; *University of Medicine and Health, Lenoirville, TN, USA

Objective: To assess the extent to which HIV counselling and testing rates in private practices, public information concerning the extent to which HIV counselling and testing rates (CS) are being utilized for referrals, and the potential need for continuing medical education related to HIV counselling.

Method: In September 1988, a nine point questionnaire printed on a self-mailing postcard was sent to approximately 10,000 physicians in New Jersey. Of 2,046 responses 2,023 completed surveys were returned for choice errors, transcription, and entered into an IBM data set. All analyses were carried out using SAS.

Results: Physicians indicated that they average only about 40% of post-test counselling themselves, in contrast to about 60% of all other counselling and testing activities. The 597 physicians who reported increasing OR credits on AIDS reported significantly increased counselling activities, with the largest relative increase in post-test counselling. Of these physicians who report practices for counselling and testing, 40% refer to local infectious disease specialists, while only 25% refer to local CS. Barriers, only 1% of respondents could accurately identify their local CS.

Conclusion: The response rate of 20% suggests that the subject matter is considered to be important by a significant segment of the medical community. Very few physicians, however, even in areas with AIDS patients, see a need of the local CS. Having OR credits in AIDS significantly increases personal involvement both in the treatment of AIDS patients and in the provision of pre and post test counselling. Information obtained via this survey is being used to plan future OR credits.

- E.680** DIFFERENCE D'EFFICACITE DU SOUTIEN ASSURE PAR UN OIL D'ELUX VOLONTAIRES.
LEMOUX, Yves
Association AIDSIS, Comité de Paris, France.

Objectif: Evaluer l'efficacité du travail d'accompagnement dit "en binôme". Il s'agit du soutien assuré par deux volontaires visitant individuellement la personne atteinte de SIDA.

Méthodes: Etude comparative réalisée sur 100 dossiers (période de référence : mars 86 à janvier 89) de suivis en binômes et de suivis individuels.

Répartition : 50% en binômes
50% en individuels

Principales sources d'information : comptes-rendus écrits par les volontaires après chaque contact, témoignages de volontaires et de personnes suivies.

Résultats: Les arrêts de suivi assurés par un seul volontaire ont des raisons non expliquées (autre que le décès du malade ou sa volonté clairement exprimée de l'arrêt de l'aide) sont beaucoup plus nombreux qu'en binôme :
50% des cas en individuel
10% des cas en binôme

Conclusion : Il est nécessaire de développer ce type de prise en charge à deux, afin d'améliorer le service offert d'une part et protéger les volontaires d'autre part. Cette technique de co-responsabilité peut-être également envisagée pour l'animation de groupes de volontaires.

Enfin, le principe du suivi en binôme paraît la meilleure approche en cas de prise en charge de toxicomanes.

A.I.D.S. THE DEVELOPMENT OF SCHOOL BOARD POLICY ON SENSITIVE ISSUES

Conrad, G. Scott, Adams, S., and Seneff, J.
Lauravert School Board, Duvrney, Laval, Quebec, Canada.

Objective: To present to participants the process the Lauravert School board used in establishing a policy on A.I.D.S.

Methods: To establish a school board policy on A.I.D.S., a committee including medical expertise prepared a document which was subjected to consultation with the parents, community and teacher councils of 19 schools.

Results: The policy, which attempts to teach appropriate behaviour, while respecting individual rights, was accepted by an entire community without rancour, division. The process raised everyone's awareness in a period of relative calm. We are now prepared should an employee or a child acquire A.I.D.S.

Conclusion: The process establishing a policy on A.I.D.S. is in and of itself an education for all involved.

E.688

LESSONS FROM FAILED TRIALS: A COMMUNITY RESPONSE

Edo, James Kirshenbaum, D. and Long, J. AIDS Coalition To Unleash Power, New York, New York, USA.

Objective: To discuss the premeditated controlled clinical trial in an ethical context.

Methods: Specific trials will be presented and the ethical dilemmas faced by subjects will be evaluated.

Discussion: Ethical abuses in trial design have led to slow enrollment, high dropout rates and incomplete data in many HIV drug studies. From an ethical standpoint, participation in a controlled clinical trial is often an HIV-infected person's only way to get a particular treatment. Research protocols must be understood as a form of treatment. U.S. AIDS Clinical Trial Group trials 005, 006 and 010 will be discussed.

E.691

HOMOSEXUALS WHO HOSPITALIZED PATIENTS WITH AIDS-RELATED COMPLEX (ARC)

18 AND 1902 (1982)

Edo, James J. Long, J., Murray, W., Harrington, M., Ed. Vincent's Hospital (1982) and Medical Center, Mt. Sinai Hospital and Medical Center, New York, N.Y., USA.

Objective: To determine the prevalence of homosexuality among hospitalized patients with ARC over a 3-year period in a community hospital in NYC and compare the characteristics of homosexual patients to those of non-homosexual patients with ARC.

Methods: Retrospective review of the medical records of all patients with ARC (n=165) admitted to Mt. Sinai between 1980-1982.

Results: Twenty-four percent of patients with ARC (n=165) were homosexual, i.e. were living in menages or menages, in lieu of admission to the hospital. Homosexual patients had significantly higher rates of intravenous drug use (IVDU), syphilis, tuberculosis (Tb) and bacterial pneumonia (BP), than non-homosexual patients. More homosexual patients signed out (SO) (1980) or were lost to follow-up (LFO) and the majority were discharged to shelters or streets (D/S) (n=84).

	Homosexual No. (%)	Non-homosexual No. (%)	L.Ratio
IVDU	22 (58)	27 (24)	<0.01
BP	13 (34)	11 (9)	<0.01
SO	25 (64)	31 (27)	<0.01
SO&LFO	18 (47)	18 (16)	<0.01
D/S (n=8)	25 (64)	33 (29)	<0.001

Conclusions: Because of a high incidence of IVDU, BP and SO among homosexual patients with ARC, who are likely to progress to full-blown AIDS, homosexuals should be addressed in these patients prior to hospital discharge, in order to halt transmission of HIV through needle sharing or airborne transmission of opportunistic pathogens to shelters or streets.

E.688

IMPLICATIONS OF FAILURES TO DEVELOP COMPREHENSIVE POLICY RE AIDS/RIV

Edo, James Kirshenbaum, D., Adams, S., and Seneff, J. National Minority AIDS Council N.Y.C., N.Y.S., USA.

Objective: To analyze the impact of AIDS as well as problems of poverty as barriers with an Infant Mortality Rate of 19.7 percent of N.Y.C.'s overall 12. As of 1/12/89 59% of the cumulative 18,116 adults are Black, Hispanic, Asian and Native American (N.A.) defined AIDS, and of these cases, 80% of the women are also minority (2,849). Peds cases are 361 of the total 402 with a Black or Hispanic mother.

The probable transmission and risk factor of both adult and peds are drug related. To extrapolate out to the adolescent cases - it is for males 13-19:125 cases, females 13-19: 10 cases. Of the 7 to 10 year incubation rate, today's cases are males 20-29:272, females 20-29:159. NYC Health Dept. estimates of 50,000 HIV+ cases would translate to predict if they are primarily Black and Hispanic and mirror issues of present cases, each will have a majority drug related risk factor, primarily low income and limited education with 1-3 children. Low birth weight and other indicators of poverty status (less than 1% have no refrigerator and no prenatal care prevents information re HIV risk factors). Implications for comprehensive planning for prevention that is class, income, education and culture/race/ethnicity specific are seen in failure to present to cope with 300,000 factor, the presence of 50,000 HIV positive women leaving as orphans from 50,000 to 300,000 healthy, emotionally unstable children.

E.696

AIDS DRUGS AND THE POLITICS OF REGULATION

Edo, James and Harrington, M. AIDS Coalition to Unleash Power, New York, New York, USA.

Objective: To place biomedical and AIDS drugs in the U.S. in the political context.

Methods: An analysis of the U.S. biomedical research budget, specific AIDS-related clinical trial protocols sponsored by the National Institutes of Health and private drug companies and drug regulations as they have been applied to experimental AIDS drugs.

Results: 1) In the U.S., most people with AIDS are from populations that have been historically marginalized, so there has never been broad-based political pressure to fund AIDS research. 2) Scientists do research to advance scientific inquiry; this favors elegant solutions to scientific problems over the development of practical therapies. 3) High-tech companies favor high-tech solutions; i.e. knockout curves and vaccines, which save writing off just about everyone who has AIDS but 4) Regulators only accept data from controlled clinical trials, so a drug proves effective after treating thousands of people on a "compassionate use" basis has been denied marketing approval.

Conclusions: The pragmatic politics of industrial constituencies, the academic politics of basic research, the market politics of drug companies and the bureaucratic politics of the regulators all delay the delivery of effective therapy to people with AIDS.

E.692

TREATMENT 2D0 AND AIDS DRUGS: A BROKEN PROMISE

Edo, James J. Long, J., Murray, W., Harrington, M., Kirshenbaum, D. AIDS Coalition to Unleash Power, New York, New York, USA.

Objective: To evaluate the success of the Food and Drug Administration (FDA)'s Treatment 2D0 program in delivering AIDS-related drugs to HIV-infected people. **Methods:** An analysis of FDA regulations governing Treatment 2D0 (1987) and streamlining drug approval (1988), an evaluation of protocols governing the release of the two AIDS-related drugs available under Treatment 2D0 and interviews with FDA officials.

Results: The FDA's Treatment 2D0 program, codified in June 1987, was designed to make drugs of some proven efficacy available before their marketing approval to people with serious illnesses or life-threatening conditions. Two AIDS-related drugs are available under Treatment 2D0.

The FDA drew the original protocol for zalcitabine as a compassionate use protocol. The drug is less available under the Treatment 2D0 program than it was before it was granted this status. Recent FDA regulations state that Treatment 2D0 bridge the time from the end of a clinical trial to the final decision on marketing approval, which is a severe narrowing of the program's original purpose. **Conclusions:** Treatment 2D0 initially promised the early release of AIDS-related HIV-infected people; however, the program has actually restricted access to promising therapies.

SOCIAL WORK STUDENTS' KNOWLEDGE AND ATTITUDES ABOUT AIDS.

Finkel, Barry*, Grosser, Shirley*
*University of Manitoba, Winnipeg, Manitoba, Canada.

Objective: To describe social work students' knowledge and attitudes about AIDS; identify relevant contributors.
Method: Approximately 240 Social Work students completed a survey designed to evaluate their knowledge and attitudes regarding AIDS. A subsample (n = 100) also completed a social distance questionnaire aimed at separating the effects of feelings about homosexuality from feelings about AIDS. This study is the first phase of a broader evaluation of an "Inbound" AIDS education package at the University of Manitoba School of Social Work.
Results: Preliminary results will focus on the level of students' knowledge about AIDS and the nature of their attitudes. The effects of a variety of demographic and contextual variables will be explored.

E.701

Adult Day Health Care as a Service Delivery Model
LEAN RAGON BECE AND LEM MCNALLY

Village Nursing Home AIDS Day Treatment
New York, NY, U.S.A.

Adult Day Health care has long been available as a service delivery model for older adults. This paper will describe the development and application of this service model for a heterogeneous AIDS population at the Village Nursing Home in New York City. Currently serving a client roster of 75, the program provides nutrition, skilled nursing services, psychiatric, psychotherapy, medication monitoring and administration, therapeutic group activities and other alternative therapies.

Costs are under a hundred dollars per day per client, and clients demonstrate marked initial improvements in body weight, grooming and mental status. There are some indications as well that the daily nursing/psychiatric triage of each client is shortening hospitalizations. Further study will be required to determine the program's effect on positive outcomes.

E.703

A HOSPITAL-BASED VOLUNTEER PROGRAM FOR PATIENTS
WITH HIV INFECTION

Bender, Paula, and Susan Paul
Department of Medicine, Veterans Administration Medical Center and The University of California, San Francisco, California, USA

Objective: To describe a hospital-based specialized volunteer program designed to meet the emotional and practical needs of HIV patients.
Methods: Joint effort of Voluntary and Social Work Services with four components: 1) recruitment of hospital employees, federal employees at large, and gay/lesbian community members, 2) selection based on application and group interview processes, 3) training for 15 day training to inform and sensitize volunteers to HIV-related issues, and 4) supervision through individual and group sessions. After "hospital internship," volunteers eligible to work with outpatients.
Results: Volunteers provide necessary emotional/practical support to patients and staff, and aid in bridging communication gaps between patients and staff. Improved continuity of care with volunteers contributing a holistic approach to care.
Conclusions: Volunteers are a necessary component to patient care. Specialized preparation is essential for a successful program. Volunteers aid in decreasing isolation, provide an opportunity to express thoughts and feelings, engender a caring environment, reduce patient stressors, alert staff to daily psychosocial and medical changes, and effectively share the overwhelming burden of care.

E.700

FAILURE TO DISCLOSE AIDS DIAGNOSIS, PSYCHOLOGICAL STRESS
AND THE UTILIZATION OF SERVICES

Schiller, Nina; Crystal, S.; DeJewski, E.; Haase, S.; Merritt, C.
Beth, F.

Rutgers University, New Jersey, United States

Objective: To examine the extent, and consequences of the failure by People with AIDS to disclose their AIDS diagnosis to members of their social support network.

Methods: Data from a survey of a population based random sample of living PWAS in New Jersey is analyzed. The sample includes a high number of intravenous drug users, male homosexuals, racial and ethnic minorities and women. The relationship between this failure to disclose diagnosis and measures of psychological distress, health status and the utilization of informal supports and of formal services is explored.

Results: Failure to disclose diagnosis is found to be widespread. Only a limited number of relatives and friends are told about the diagnosis. The relationship with this attempted network is strengthened. The failure to disclose diagnosis is shown to vary by risk group, gender, and cultural background and to be related to distress but not to the utilization of formal services.

Conclusion: Failure to disclose diagnosis is a significant variable in the analysis of the psychosocial state and coping behavior of PWAS.

E.702

PROJECT OPEN HOME - ATLANTA:
DAILY MEALS FOR PEOPLE WITH AIDS AND ARC.

RENÉE L. HUBERT, PROJECT OPEN HOME, Atlanta, Georgia, U.S.A.

OBJECTIVE: To describe a non-profit community based AIDS/ARC support service devoted to providing meals to persons with HIV infection.
METHOD: Project Open Home - Atlanta, is a non-profit volunteer organization designed to provide nutritionally balanced meals to needy persons with HIV infection. It is a member source of structures recruits the able of volunteers and appeals for funding to Community Organizations, Private Foundations, and Individuals. St. Bartholomew's Episcopal Church provides kitchen, office and storage space for the Project and its volunteers.

Daily operations are handled by a volunteer staff consisting of a project director, kitchen coordinator, secretary and approximately 15-20 volunteers each day who assist in preparation and delivery of meals to clients. Each client receives two meals each day, if the client has no way to heat or store the meals, Project Open Home can loan microwave ovens or refrigerators as needed. Clients are referred by physicians, nurses, social agencies and friends. To qualify for services, clients must express a need for assistance and secure a physician's statement verifying the HIV diagnosis. Assessments are completed on each client to determine special dietary requirements and needs. These needs are addressed when meals are prepared and delivered.

MEALS	5/82	10/82	11/82	12/82
clients served	43	124	108	104
meals prepared	86	248	216	208
volunteers	186	124	186	154

100% rating for service.

CONCLUSION: Many people with AIDS/ARC face difficulties in matters of daily living. Financial obligations often exceed the amount of disability checks. Many face physical wasting, loss of appetite and apathy about eating. Project Open Home Provides nutritionally balanced meals to clients at no charge. Clients enjoy the personal contact when the meals are delivered and look forward to the next day.

E.704

SOCIAL SERVICE WORK RELATED TO AIDS PATIENTS

Morandini, R.J., Lofel, C.J., Ferreira, A.C.J.
Motta, P., and Colombo, A.S., Javei, D.S. From Faculdade Paulista de Medicina, BH/SP.

OBJECTIVE: To give biopsychosocial counseling to assure a better quality of life to the patients.

METHOD: The patients are all with positive HIV results. Nowadays we have 130 patients from July/1988 to Jan/1989. Interviews with the patients and counseling are our means of methodology, reaching that will help clarify their needs.
RESULTS: Characteristics of the patients: 86,28 male, 13,98 female; 18,18 married; 72,88 single; 9,28 others; 81,98 are between 24 and 45 years of age; 57,78 homosexual; 13,04 drug addicts; 10,08 bisexual; 19,38 others. We have observed that through the whole work, the 130 patients presented the following patterns: 49,3% of consciousness, 21,9% of behaviours; 2,88 economic, 3,8% of work, 3,18 family, 12,18 two or more patterns and 3,88 clinical occurrences. From these 130 patients: 59,28 maintain their professional activity; 25,9 are in social security and only 14,6% are inactive.
CONCLUSIONS: The biopsychosocial help, the education process of conscientization, the process of unifying attitudes and diminishing the basic social problems surely lead to maintain the AIDS patients productive and socially integrated.

A NOVEL METHOD FOR BLENDED ROUTINE BLOOD SAMPLES AND DATA COLLECTION PRIOR TO RISK INDETERMINATE INFECTION (RIV) ANTIPOY TESTING FOR UNBLINDED SEROPREVALENCE SURVEYS

Tapert, R.; Brady, C.; KARNES, ROSEMARY; BRACCI, P.; BERARDI, V.; ROSE, J.; U.S. Dept. of Public Health State Laboratory Institute (SLI), Boston, MA, U.S.A.

Objective: To design a system to collect demographic and other data without personal identifiers on routine blood samples for subsequent HIV antibody testing to determine seroprevalence in certain population groups.
Methods: Routine blood samples are submitted to SLI for serologic testing for syphilis (RPR). Data from test requisitions including date, sex, age, race, residence, indication for testing, information on risk behaviors, and reason for clinic visit are entered into a laboratory computer database. After RPR, unused sera are aliquoted into tubes marked only with a sample number in alcohol soluble ink. The sample number permits access to all data extracted from the requisition into the laboratory computer database. A computer program extracts only nondescriptive geographic, risk, and reason for visit variables from the database with STS result. This information is encoded in a bar code label which is applied to the tube. The sample number is then removed with alcohol, blinding the specimen. Blinded samples are placed in tube racks in random order, frozen, and batched for HIV antibody testing. When ready for testing, data from the bar code label are read electronically into a separate computer file with a new sample number, to which the HIV antibody result is assigned.
Results and Conclusions: Information on HIV seroprevalence by age, race, sex, area of residence, risk, reason for visit, and STS result is obtained from routine blood samples with maximum preservation of patient confidentiality.

E.713

ANONYMOUS OR CONFIDENTIAL HIV TESTING AT STD CLINICS

Reider, Gary; LoCaino, J.*; Byrnes D.**. *Saint Michael's Medical Center, **East Orange Health Department, Newark, N.J.

Objective: Should anonymous or confidential testing be the preferred method of testing for HIV infection in STD clinics.

Methods: Over a 7 month period, 340 patients were seen at the STD clinic of an inner city neighborhood. Counselled patients were given the choice of confidential or anonymous HIV testing.

Results: 248 patients were counselled. Only 140 patients accepted HIV-antibody testing. Anonymous testing was chosen by 51% of the patients. In 13 (3%) patients HIV-antibody was positive. Of the 140 patients tested only 28 (20%) called for results of their test. Due to anonymous testing 7 HIV-antibody positive patients could not be traced.

Conclusion: The above data demonstrates that in an STD setting, confidential HIV testing is more appropriate than anonymous testing, since field workers would be able to follow up on positive cases and hence assure the necessary medical follow up care for patients.

E.715

WILLINGNESS TO OBTAIN HIV ANTIBODY TESTING IF RESULTS MUST BE REPORTED RATHER THAN CONDUCTED ANONYMOUSLY

Kaplan, Susan; Calamia, J.; Coates, T. Lo. B. University of California-San Francisco, California.

Objective: To examine, among people who are seeking the HIV antibody test, whether changing the conditions under which testing would be conducted would influence the willingness to obtain testing. This was part of a larger study on the consequences of HIV antibody testing.

Methods: All adults seeking testing at an alternative test site before testing is offered free of charge and anonymously were asked to participate in the larger study (N = 957) by completing self-administered surveys (participation rate = 86%). A random subset of the larger study participants (N = 156) were asked about the conditions under which they would be willing to be tested.

Results: Thirty-nine percent reported that they would avoid testing if it were conducted confidentially rather than anonymously. Sixty percent said that they would avoid testing if the names of seropositives had to be reported to public health officials, but kept confidential or if seropositives had to be reported and contact-tracing would be conducted. There were no significant differences in the proportions of gay/bisexual men versus heterosexual men and women who would consent to testing under the various conditions (76% of those seeking antibody testing were heterosexual).

Conclusions: Previous research has shown positive effects on risk behavior when people voluntarily seek anonymous antibody testing. These findings indicate that many people who otherwise would have sought testing will avoid it if such testing is no longer conducted anonymously.

E.712

THE EPIDEMIOLOGICAL SIGNIFICANCE OF OFF-CITY HIV COUNSELING AND ANTIPOY TESTING AMONG STUDENTS ATTENDING AN URBAN STATE UNIVERSITY

Richway, Michael; Tripp, D., Cincinnati Health Department, Cincinnati, Ohio, United States of America

Objective: To describe HIV infection risk behavior patterns and HIV antibody sero-prevalence rates among students attending a state university having a large urban campus in a city with a moderate HIV infection prevalence rate.

Methods: In cooperation with student campus organizations, free and anonymous HIV antibody counseling and testing was advertised and subsequently made available during a three day period at the University of Cincinnati Student Center. Counseling and testing procedures were identical to those utilized during the past three years at the HIV Counseling Testing Site, Cincinnati Health Department. HIV risk assessment data was recorded on a standard form. Data was then optically scanned and analyzed using the Medical Information Management System (MIMS), an automated data storage and retrieval program.

Results: A program of off-site HIV antibody counseling and testing can be a successful, epidemiological tool in assessing HIV prevalence rates within a well defined population. Although the unprotected sexual activity level is substantial among students on an urban state university campus, HIV prevalence rates reflect moderate nature of this infection prevalence within other community groups.

E.714

SHARING THE NEWS: TRAINING BEGINNING COUNSELORS TO DISCLOSE HIV ANTIBODY TEST RESULTS

Duckworth, Michael; Pies, C.**; Broome, J.*; Deich, D.*; Ramirez, A.**; Japerson, J.**

*University of California AIDS Health Program, San Francisco; ** Education Program Association, Campbell CA; ***California Department of Health Services, Office of AIDS

Objective: To present a training model designed to train beginning HIV antibody counselors how to provide pre- and post-test counseling.

Methods: The UCSF AIDS Health Program, through the alternative test site program in San Francisco, has provided over 4000 antibody test results. The Project has provided training for approximately 1,500 persons on how to provide antibody test counseling. A one-day HIV Antibody Counselor Training course has been developed for this purpose. This presentation will discuss the philosophy of training, some specific training techniques used, and the results of the program and share some of the difficulties encountered.

Results: If three-day trainings will be held throughout the state by 1989, preliminary evaluation of the program's success will be offered. The complete training manual will be available for review.

Conclusions: This carefully planned and proven training program for new HIV antibody test counselors will aid in the provision of pre- and post-test counseling services in HIV antibody test settings.

Supported in part by a grant from the California State Office of AIDS, contract # 88-94679.

E.716

RISK FACTORS AND HIV SEROPREVALENCE IN FEMALE CLINICS OF SELECTED HEALTH DEPARTMENT CLINICS, HOUSTON, TEXAS

Crane, P.; Terhune, P.*; Decker, M.*; Gatta, P.*

HIV/AIDS '84

*University of Health Science Ctr., Houston, Texas, U.S.A.

**Department of Health and Human Services, City of Houston, Texas, U.S.A.

Objective: To determine prevalence of HIV infection and risk factors for HIV infection in women attending selected City Health Department Clinics in Houston, Texas.

Methods: 278 and 48088, a 477 women attending Family Planning, Prenatal and Sexually Transmitted Disease (STD) Clinics completed an anonymous, self-administered risk assessment questionnaire. Of these, 1063 referred themselves for counseling and completed a risk factor interview. Results: 81% (1/25) of the 712 women who were tested for HIV were confirmed HIV seropositive by western blot and 11 (1.2%) had serological test results. Approximately 20% of the women completing the self-administered risk assessment form reported at least one factor that would have made them eligible for HIV testing including self or partner using IV drugs (35), STD within the previous 5 years (15) or bisexual or HIV-infected partner (25). Only 38% of these women referred themselves for counseling and testing. Of the women who were tested, approximately 70% were considered to be at increased risk of HIV infection by virtue of IV drug use or an ongoing relationship with a high risk partner.

Conclusions: Although HIV seroprevalence is relatively low in this self-DETERMINED population, conditions exist for its continued spread. A significant number of women attending these clinics maintain their increased risk.

Publications

Le SIDA, la société et le comportement
AIDS, Society and BehaviourE.717 FAILURE TO RETURN FOR HIV TEST RESULTS: A SECOND LOOK AT
DETERMINANTS

Debrah Bagg, D. Miggins, D. Schell
Centers for Disease Control, Atlanta, Georgia USA

Objective: To assess factors affecting a 50% failure to return rate in an anonymous HIV Counseling and Testing (ACT) site.
Methods: A questionnaire designed to measure the psychosocial, behavioral, and demographic factors found to be predictive of failure to return in past studies, as well as the immediate impact of pre-test counseling, was self-administered by 503 715 clients in DeKalb County, Georgia.
Results: Respondents were male (57%) and female (42%); white (59.4%) and black (29%), generally single (53.3%) heterosexuals (68.1%). Bivariate and multivariate regression analyses showed race to be the single most independently predictive factor in determining failure to return (Chi square=4.9, p<.001). Additionally, race was also a factor in study participation, although those who did not participate in the study had the same return rates as those who did. Significant differences between whites and blacks were also observed.
Conclusion: Test reasons for failure to return included fear of test results (50%) and a low priority on learning results (30%). Serostatus and risk group membership were not significant predictors of failure to return.

Implications: This study suggests failure to return rates are affected by race and counselor variables. Since these variables operate to affect return rates warrants further study.

E.719 RAPID, INSTRUMENT-FREE ASSAYS CAN BE USED IN TANDEM FOR
SCREENING AND CONFIRMATION OF HIV INFECTION.

F. Spelberg, K. Auditor-Hagrupova, W.L. Hayward, R.W. Ryder, J.C. Quinn, Milton S. Jam, et al. The Diabtech Program for Appropriate Technology in Health, Seattle, WA, USA; CDC, Atlanta, GA, USA; Project SIDA, Kinshasa, Zaire; and NIAID, Bethesda, MD, USA.
Objective: Although alternative methods to blood screening by conventional ELISA exist, to date Western blot (WB) remains the accepted confirmation method. This study was to evaluate performance and cost-effectiveness of rapid, instrument-free assays used in tandem for screening and confirmation.
Methods: 3,878 serum samples (5.5% HIV-1 seroprevalence) were collected and tested in each of five different rapid assays, as well as conventional ELISA and WB in Kinshasa, Zaire. The results were analyzed retrospectively to determine the accuracy of a test method which included neither ELISA nor WB.
Results: A testing hierarchy comprised of duplicate screening assays, followed by confirmation in duplicate of all repeatedly reactive specimens, provided perfect accuracy when HIVOCEK (Du Pont) was employed as the screening assay and Serodiv-HIV (Fujirebio) as the confirmatory assay. Compared to the standard method of ELISA screening and confirmation by WB, the rapid method resulted in a cost savings of approx. \$3.00 per positive specimen identified.
Conclusions: The ability to use one rapid assay to confirm the results of another can be expected to facilitate blood screening in developing country transfusion centers, where highly technique-dependent methods such as WB are not appropriate. While a modest cost savings can be realized without compromising accuracy, the major advantages are in the savings of time and labor, and eliminating dependence on capital equipment. However, despite these considerable advantages, the cost per HIV-positive unit identified is still unrealistically high for the majority of developing countries.

E.721 POLICY, LEGISLATION AND RESPONSE; MANDATORY HIV TESTING

D.S. Friedman
Kent E. Elisebach, Medical Director, San Francisco County
Jail; University of California, San Francisco, USA

Objective: To consider policies and legislation regarding mandatory HIV anti-body testing of US prisoners, and to compare and contrast the responses of health care and prisoner advocacy personnel to essentially similar mandates.
Methods: A review of local policies, popular elections and legislative actions mandating HIV screening of prisoners will be presented.
Results: Health care personnel and prisoner advocates have responded to these mandates with varying degrees of enthusiasm or opposition. Mandatory testing necessarily excludes informed consent, confidentiality of results, and often is not tied to counseling and education. In some jurisdictions, health care personnel are required to provide institutional staff with lists of HIV + or "possibly infected" individuals.
Conclusion: Mandatory HIV testing presents challenges to professional norms, standards of care, and to individual rights.

E.718 MULTI-LAB STUDY RESULTS OF A NEW RECOMBINANT ELISA

IMMUNOASSAY FOR ANTIBODIES TO HIV COMPARED AGAINST DUPOUT WESTERN BLOT, E. Baden, M. Vashiliani, M. Scott (Jackson Instruments, Inc. 300 S. Kramer Blvd, Ives, GA 98621); Dr. M. Busch (Civian Memorial Blood Bank, San Francisco, CA); Dr. M. G. Hirsch (U.S. Dept. of Health Services, Berkeley, CA); Dr. K. Thorenstam (Swedish National Institute of Health, Stockholm, Sweden).

The etiologic agent implicated as the probable cause of Acquired Immunodeficiency Syndrome (AIDS) is the Human Immunodeficiency Virus (HIV). The Western Blot™ HIV Reagent Kit is a semi-quantitative assay for the detection & identification of antibodies in human serum or plasma to proteins representing GAG (p18 and p24), GP (gp 120 to gp 160) and POL (p66/31). These antigens are purified recombinant peptides produced by genetic engineering techniques in E. Coli. Individual peptides are reacted in a microtiter plate format.
After incubation of diluted sample (1:100) in the microtiter plates, the plate is developed with alkaline phosphatase conjugated/substrate A reagent at 410/490 nm. Total assay time is less than 6 hours.
The absorbance cutoffs for each peptide was established with 1000 samples. Data, the established criteria of positivity for each, 1440 samples were compared against DuPont Western Blot.

	850	AQ	DUPOUT	POS
NB	1082	16	0	0
DWS	117	116	126	0
POS	0	5	274	0

Buschman recommends that each evaluator establish their own cutoff & criteria of positivity for this research use only product but found excellent results with the stated criteria in correlation to DuPont Western Blot.

E.720 TB SKIN TESTING: A PROTOCOL FOR IMPROVING HEALTH AND
EPIDEMIOLOGICAL INTERVENTION WITH HIV SEROPROTECTIVE INDIVIDUALS

Anderson, P. Frossen, A. Bailey, Charles E. J.

Objective: To improve TB screening of HIV antibody positive clients, improve partner notification efforts, improve assessment of HIV seroprotective individuals, and improve client comprehension and retention of HIV positive counseling messages. **Method:** Offer TB skin test (PPD) at post test counseling session to all individuals testing HIV positive. For those who accept, another counseling session will be offered in conjunction with the appointment to read the skin test. The counseling session could include any of the following: 1.) Assessment of client's medical status including medical comorbidity, 2.) Assessment of clients knowledge and retention of post-test counseling messages and their performance, 3.) Partner notification counseling to enhance, through roleplay, client's willingness and ability to tell sex partner(s) needle-sharing partners they may have been exposed to HIV. Health Dept.'s assistance will be offered on a voluntary and anonymous basis when counselor assesses the need for it or the client requests the service. **Results:** Program will begin February 1, 1989. Results of client assessment of this program will be presented. **Conclusion:** Upon learning their HIV seroprotective status, clients may be anxious and in shock and thus retain a very small percentage of information from the post test counseling session. Discussion of partner notification can also be inappropriate at that time. The TB test provides a health screening as well as a reason for a return visit for additional counseling and assistance with partner notification.

E.722 STD SCREENING AT ALTERNATE HIV TEST SITES?

Thomas Gagliardi, Oscar P. Russel, Dr. Robertson OHS,
Rettelle RW. Dep. Gastroenterology/Medical(GM), Royal

Infirmary, "Communicable Diseases Div., City Hospital, Birmngham, UK.

Objective: In 1985 the City Council funded a seroprevalence study set up as an alternate HIV test site & has now seen 1718 clients (254 were injection drug users [IDU]). A prospective study was set up to assess the need to screen for sexually transmitted diseases(STD) in clients seropositive above HIV.
Method: New clients were offered STD screening, their risk factors for HIV & for concurrent STD(s)/low/high risk were assessed. A comparison was made with those attending GM for an HIV test.

Results: Preliminary results on 605 GM & 110 CDC clients.
GM(155 had HIV test +ve) | No. | gm. STD test | STD Definito. | STD +ve |
No. risk HIV tested | STD +ve | STD test | STD Definito. | STD +ve |
Low 27 9 36 6 4 0 0
High 26 9 35 6 1 2 2
Not Done - - - - - - - - -
Total 53 18 71 13 5 2 2

Conclusion: None of the GM HIV test sites which may imply they do not regard HIV as an STD (one of 2 STD +ve was a partner of 2 STD +ve) Assessed risk in GM(155) was below that of CDC(110) in those HIV seropositive. 9/60 (14%) CDC clients tested STD tests other than HIV, of those (6/32) defined either as negative HIV results. It seems clients' choice of clinic depends on their perceived STD risk. People are reluctant to STD testing at CDC, which has important implications for health education regarding HIV spread.

PEOPLE ASSOCIATED WITH TESTING THE HIV SCREENING TEST
Yvonne Kiehl, Health Policy Institute*, L. Hofmann*, R. Higgins* Boston Univ. *Mass. Dept. of Public Health/D.P.H.

OBJECTIVE: To determine if those at risk for HIV infection are more likely to obtain a screening test.

METHODS: A statewide anonymous random digit dial telephone survey of 1,223 Massachusetts residents was conducted in October 1987. Information about demographics, attitudes and concerns about AIDS, and risk factors was obtained and examined in relation to whether respondents had been tested or would be willing to be tested for the HIV antibody (AB).

RESULTS: Of 1,223 respondents, 111 (9%) had been tested; all but two had received negative test results. Persons with at least one risk factor were more likely to have received the test than without risk factors (12.1% v. 7%), (p<.05).

RISK FACTOR

RISK FACTOR	NUMBER	% TESTED	% WILLING TO BE TESTED
Gay/MSM + partners	59	14.1	41.1
IV drug users + partners	79	11.1	7.1 (p<.05)
Need recipients + partners	75	23% (p<.05)	47%
Respondents with other sex risks + partners	377	11% (p<.05)	6% (p<.05)

Persons who had not been tested and had at least one risk factor were more willing than those without risk factors to be tested if the test were free and anonymous. (SEI v. 40), (p<.05).

CONCLUSION: Although many of those more likely to have received the screening test, the proportion of respondents with risk factors who had been tested was relatively low. Of those not yet tested, a majority would be willing to be tested. The use of free and anonymous tests may increase the likelihood that individuals at risk will choose to be tested.

E.726

Recruitment of Research Subjects at Risk for AIDS

Authors: Pamela Bellini, M.S.; Barbara Newman, M.A.; Patricia Walter, R.N.; Lawrence Goodenough, M.D., Ph.D.; David Smith, M.D.; Cornell University Medical College, New York, N.Y., U.S.A.

Objective: To test methods for recruiting physically asymptomatic subjects at risk for AIDS into longitudinal psychological studies. Psychological diagnosis, the central public health need, limited prospective clinical data are available regarding the psychological and behavioral effectiveness of being at risk for acquiring or transmitting HIV. Many potential sources of subject pools of confidentiality and see little personal benefit in hazardous studies, findings to date have generally been from self-report measures of subject samples of asymptomatic males. **Methods:** To reduce concerns about confidentiality, our study was conducted in a private residential setting and with an agreement that no information would be given to any third party; further, overall arrangements were made to preclude subjects seeing one another, and contact for follow-up was arranged in accord with subject specifications. To offset the burden of extensive clinical assessments, we provided free periodic HIV testing and individualized counseling by a psychiatric nurse. **Results:** Over 18 months, in depth prospective clinical psychological assessments were obtained on 260 physically asymptomatic subjects who were independently heterogeneous and represented major risk groups: 145 gay/bisexual males, 34 IVU, and 81 heterosexuals with suspected or known infections. Seropositivity rate was 37%, and attrition at 6 months was 29%. **Conclusions:** If confidentiality is absolutely protected and supportive care provided, psychological studies of at-risk populations are feasible; however, in designing and conducting future studies, researchers should consider the additional demands and cost of meeting special requirements posed by the AIDS epidemic.

E.727

REASONS FOR NOT DISCUSSING HIV-ANTIBODY TEST RESULTS TO OTHERS - DATA FROM A COHORT OF SEROPOSITIVE GAY MEN

J. Margolis, J. Bellini, P. Buchheit, & M. Rosen. School of Medicine, University of Illinois, Urbana, Illinois, U.S.A.

Objective: To determine the reasons for not discussing positive HIV-antibody test results to others, in a cohort of gay men.

Methods: 77 seropositive gay men reported reasons why they were concerned about discussing test results to others at 2 weeks, 2, 4 & 12 months following notification, using a questionnaire developed by Handel.

Results: 1 REASONS POST-NOTIFICATION 1 YEAR POST-NOTIFICATION

Fear of Practical Losses	73%	45%
Job	49%	45%
Insurance	43%	87%
Housing	40%	33%
Fear of Relationship Losses		
Love	20%	14%
Sex Partners	20%	14%
Family	27%	41%
Friends	22%	0%
Fear Inge as AIDS Carrier	70%	0%

Conclusions: Potential loss of health insurance, housing and jobs are primary reasons for not wanting to discuss HIV-antibody test results to others. Fears of disturbing close relationships are of less concern. Merits of being perceived as an "AIDS carrier" diminished over the year.

E.724

THE EFFECT OF HIV ANTIBODY TESTING UPON SEXUAL BEHAVIOR, CONCERN ABOUT AIDS AND AIDS RISK COMMUNICATION.
HALL, L. HARRIS, M.D. Shoshul, M.D. Department of Medicine, Los Angeles, California, U.S.A.

Objective: We evaluated the effect of a negative HIV antibody test upon sexual behavior, concern and knowledge about AIDS, and communication with sexual partners (SPs) about AIDS risk.

Methods: 256 heterosexuals attending an urban sexually transmitted disease (STD) clinic entered a randomized trial of HIV testing. All subjects received AIDS education and pre-test counseling, completed a questionnaire, and had blood drawn, then 124 received a "TEST" and post-test counseling; 94 tested negative for HIV. The 122 "NO TEST" subjects were informed of alternative test sites. A follow-up survey was completed 8 weeks later.

Results: Participants had a mean age of 27 years; 68 were male, 84 were female. TEST and NO TEST groups did not differ in baseline number of recent unprotected SPs, in number of inquiries to SPs about AIDS risk or in AIDS knowledge. Follow-up of 78% of subjects revealed a decrease in mean monthly number of unprotected SPs (1.7 to 1.2, p=0.0001), but no difference between TEST and NO TEST groups (p=0.38). TEST subjects however, reported that they were more worried about getting AIDS (p<.05) and asked partners more questions about AIDS risk (p<.001). They were more likely to increase questions about partners about HIV tests (p<.05) and intravenous drug use (p<.001). AIDS knowledge did not differ at follow-up.

Conclusions: In STD clinic subjects who received an educational intervention, HIV testing was associated with increased concern about getting AIDS and more questioning of SPs about AIDS risk, but did not affect knowledge about AIDS or sexual behavior.

E.726

PERCEPTION OF RISK FOR HIV INFECTION AND THE DESIRE FOR HIV TESTING AMONG IVU AND NON-IVU DRUG USERS

Wolke, John, Abidin-Quader, A.M., Preid, C.C., Rockwell, R.M., Fenwick, S.

*Beth Israel Medical Center, New York, N.Y., U.S.A., **Narcotic and Drug Research, Inc., N.Y., U.S.A.

Objective: Since HIV testing is advocated for high risk behavior groups, we examined the perception of risk for HIV infection and the desire for HIV testing among Intravenous (IVU) and Non-Intravenous (Non-IVU) drug users entering a detoxification facility in NYC. **Methods:** A brief survey was administered to 100 substance users applying for detoxification from drug or alcohol. Information was collected concerning their understanding of HIV testing, their perception of their risk for HIV infection and whether they wanted to be tested for HIV. **Results:** N=100, 70 male/30 female, Mean age = 35, 43 Black, 34 Hispanic, 14 White. 17% Non-IVU, 83% IVU. 17% Non-IVU, 83% IVU of heroin or cocaine, 37% Non-IVU (use cocaine, alcohol, or methadone).

1. Awareness of the existence of the HIV Test ----- 60% 39% (p<.05)
2. Cognizant of spectrum of HIV infection from asymptomatic to AIDS 53% 37% vs
3. Believe that their own risk of HIV infection was 5.10% ----- 81% 81% vs
4. Previously HIV tested ----- 44% 19% (p<.05)
5. Wanted to HIV tested during this hospitalization ----- 77% 67%

Verification of self assessed HIV negative status was the reason given by the majority of those who wanted to be tested.

Conclusion: IVU's were more likely to know about HIV testing and were more likely to have been tested. However, IVU's tend to minimize their risk for HIV infection.

E.728

HIV TESTING AT AN ALTERNATE TEST SITE IN NEW YORK CITY.

Rinder, Bruce; Albrecht, Robert; Heward, S. J. and Palmer, Wagh, U. Beth Israel Medical Center, New York, NY, U.S.A.

Objective: To describe the population characteristics of persons presenting for HIV testing at an alternate test site in New York City.

Methods: The Infectious Disease Research Institute Medical Center was designated as an alternate confidential HIV test site in January 1988.

Results: 1000 persons were provided confidential HIV testing. On all persons tested, clinical and demographic information was obtained. HIV serology was performed using the ELISA and was confirmed by the Western Blot method. Post-test counseling was offered to all after receipt of lab results.

Results: Of the 531 persons tested during 1988, 244 were males, 221 were females and 66 were children of high risk mothers. Overall, 1051 (20%) males, 512 (24%) females and 261 (29%) children tested were seropositive. Analysis of data according to risk group for adult males and females is tabulated below:

	1st test				
Male	100	100	100	100	100
Female	100	100	100	100	100
Child	100	100	100	100	100

Conclusions: 1) A heterogeneous population sought testing at our alternate test site during 1988. 2) The majority (68%) of men who presented for testing belonged in conventional risk groups (gay, IVU). 3) In contrast, the majority (70%) of women came for testing because of concerns over their heterosexual relationships.

Publications

- E.729** DISCLOSURE OF HIV-ANTIBODY TEST RESULTS & REACTIONS OF HEALTH PARTNERS, FRIENDS, FAMILY & HEALTH PROFESSIONALS
 T. Magill, J. Buckley, P. Benchetti, M. G. Seal, School of Medicine, University of California, San Francisco, San Francisco, CA, USA.
- Objective:** To investigate to whom HIV-ab test results are disclosed.
Subjects: 107 gay men reported: 113 Persons told results of HIV-ab test and 121 their reactions to HIV-ab test 4 to 12 weeks following notification.
Results: Disclosure to whom HIV-ab test results were disclosed (percentage of those told expressing unfavorable reactions):
- | | 2 WEEKS POST-NOTIFICATION | 1 YEAR POST-NOTIFICATION |
|----------------|---------------------------|--------------------------|
| Persons | Positive | Positive |
| Lower | 313 (121) | 313 (121) |
| SexPartners | 193 (69) | 193 (69) |
| Bestfriend | 161 (58) | 161 (58) |
| Mother | 154 (17) | 154 (17) |
| Father | 125 (14) | 125 (14) |
| Physician | 121 (13) | 121 (13) |
| Bestie | 121 (13) | 121 (13) |
- Conclusions:** About half of lovers and nearly a third of one sex partners were told test results - more widely by negatives than positives. Friends were almost always told and reacted well. Mothers were told less twice as likely to be told a father. Best physicians had been told by one year after notification - but less than a third of dentists. Negatives had favorable reactions to all positives experienced their most unfavorable reactions from dentists and sexual partners.

- E.731** PSYCHOLOGICAL IMPACTS OF INDETERMINATE HIV WESTERN BLOTS.
 Connie Galamb, Vlastos, P.P., Lafferty, W.E., Roberts, P.L., Hirsch, R.W. Univ. of Washington, Seattle, Washington, D.C., U.S.A.
- Objective:** Indeterminate results on Western blots pose a problem for both patients and clinicians due to the lack of consensus on the significance of indeterminate Western blots (IWb). We conducted an ongoing prospective study to characterize anxiety, depression, coping processes, and specific symptoms in 100 patients with IWb.
- Methods:** Thirty-seven individuals with positive HIV ELISAs and IWb were referred from diverse HIV testing sites in Washington state (50% from low and 50% from high-risk groups) and voluntarily participated in a prospective study. Standard instruments were used to measure depression (Beck Depression Inventory), anxiety (Symptom Checklist-90), coping (Ways of Coping Checklist), and the psychological impact of IWb.
- Results:** Seventeen individuals were tested for HIV because of concern over past sexual exposures to heterosexual, 13 heterosexual, 4 because of intravenous drug use, 11 as blood donors, 4 as applicants for the insurance, and 13 in the military reserves. Causes reported considerable anxiety and depression in semi-structured interviews and the Beck and SCL-90 measures. Coping by self-blame and avoidance (denial) were significantly correlated with anxiety (r=.44 and .32, respectively, p<0.05). Inverse HIV events attributed to the IWb included consideration of termination of a first trimester pregnancy, use of the IWb in a custody case, ineligibility for the insurance, marital distress, and the decision to drop out of medical school. Informational needs included explanation of ELISA and Western blot techniques and results, discussion about the low rates of seroconversion in low risk individuals with IWb, possible etiologies other than HIV, and options for further evaluation.
- Conclusions:** Counseling of individuals with IWb should include assessment of anxiety, depression, coping processes, the attributed consequences of IWb, and should provide information about HIV testing techniques and options for further evaluation.

- E.732** DIGNITY CANADA DIGNITE AIDS PASTORAL CARE PROJECT
 Dignity Canada, Charis, J. and Simon, C.C., National Director, Dignity Canada Dignité, AIDS Committee Chairperson, Dignity Canada Dignité

What is "pastoral care"? It is relevant to people dealing with AIDS? What forms can it take? Who is qualified to administer it? Who is eligible to receive it? These were the fundamental questions asked by the Dignity Canada Dignité AIDS Pastoral Care Project. Furthermore, the Project was interested in determining the scope and nature of pastoral care as an eye to indicating the directions for development of more responsive pastoral care initiatives.

Data was collected by means of a self-administered questionnaire made available across Canada in two languages. The tabulated results indicated wide-ranging answers to the Project's fundamental questions. Answers receiving or wanting to receive pastoral care were not to be limited to persons actively ill with AIDS, but included as well the asymptomatic, the family and friends of the presently and potentially ill, and also AIDS caregivers themselves. Those perceived as "givers" of pastoral care were not only the recognizable representatives of organized religion, but also family, friends and caregivers as well. The forms (both experienced and hoped for) of pastoral care related to AIDS included: one-to-one pastoral care, as well as an development of public policy by religious institutions. The need for persons sensitively informed and specially trained in dealing with AIDS was indicated. And the need for openness to the spiritual dimension, with an array of specific issues* (e.g., pain, suffering, grief) demanding particular focus.

*Top ten resentments/sin/sinfulities on such issues.

- E.730** QUALITY ASSURANCE IN ANTI-HIV TESTING -
 JENNIFER MCGRAW and Polesky, H.F. Memorial Blood Center of Minneapolis, Minneapolis, USA

Objective: To document the high quality of anti-HIV testing performed by LABORATORIES participating in external proficiency testing programs. **Methods:** The College of American Pathologists and the American Association of Blood Banks jointly sponsor a proficiency testing program for laboratories testing for antibody to human immunodeficiency virus (anti-HIV). Panels of 5 samples each are mailed quarterly to approximately 1000 subscribers. Participants are provided with a report summarizing results by test method and report manufacturer.

Results: Over the past 3 years greater than 90% of laboratories reporting ELISA screening methods have correctly identified anti-HIV reactive samples. Reports from laboratories using western blot confirmation methods show a low greater than 95% agreement on reactive samples. Non-reactive samples were correctly identified by greater than 95% of laboratories reporting confirmation testing while those using only ELISA screening tests were more likely to report false positive results. Some variability in sensitivity and/or specificity of both ELISA and western blot test reagents can be documented.

Conclusion: Laboratories participating in external proficiency testing programs maintain a high level of performance. These programs are useful in monitoring the performance of flow comparison with others using similar methods and reagents.

- E.732** HIV: A PRIVATE SECTOR MODEL PROGRAM TO PROMOTE COMMUNITY BASED CLINICAL DRUG TRIALS
 Anderson, Robert L., King, D.**, Lang, C.**, Beaulieu, P.**, Johnson, K., DeLong, J.**,

Methods: The combination of an ongoing monitoring program for HIV seropositive patients, a patient registration system for primary care physicians, and direct advertising in target media reaching high HIV prevalence populations was developed to facilitate registration and subsequent enrollment into IRB-approved clinical trials. Startup funding was provided by a venture capital firm with ongoing support from pharmaceutical sponsors.

Conclusions: A private sector model program has been established in San Francisco to efficiently conduct sponsored clinical trials. This program augments current systems of university-based programs, Community Research Initiative and County Councils, and differs in the use of a dedicated research facility and private funding for startup and ongoing support. Initial response from industry and patients has thus far been favorable.

- E.734** AIDS AND SPIRITUALITY: LIVING IN THE FACE OF DEATH
 Carol L. Huntington, ACM, AICW, University Hospital
 University of Medicine and Dentistry of New Jersey,
 Newark, N.J., Associate Minister, Christ Episcopal Church,
 Teaneck, N.J., U.S.A.

Objective: The AIDS social worker is faced with the dilemma of incorporating spiritual issues into traditional clinical intervention strategies.

Methods: This paper is based on clinical observation gained in social work practice with AIDS patients at University Hospital in Newark, N.J., and pastoral counseling as a professional in the Episcopal Church. Most of my patients are IV drug abusers.

Results: AIDS social workers are in a unique position to address people of faith, courage, and love.

Conclusions: AIDS social workers are in a unique position to address appropriately the needs of a person who presents with a spiritual crisis. This paper examines what is appropriate for the social worker to do, what is not appropriate, and when, to whom, and how to refer. It looks at the positive and negative aspects of spirituality and how social workers can best respond to the statements and questions of faith.

Conclusion: It is in that responsibility that we are most able to help patients seek life in the face of death. Social workers are challenged to confront spirituality, strengthen it and use it therapeutically in social work practice with AIDS patients.

Publications

- E.735** MEDIA MESSAGE (PROTECT YOURSELF AND EACH OTHER)
Smith, Linda; Seaborn, J.; Latrop, L.; Bouvick, D.
Calgary, Health Services, Calgary, Alberta, Canada
- Objective.** Young adults, not associated with a school or institution are a difficult audience to access with health information. Positive messages, about the use of condoms to prevent pregnancy and STD's including AIDS, are particularly important for this age group which has high STD and unwanted pregnancy rates. There are few positive media images on how to use condoms, who purchases them, or how to talk about using them with a partner.
- Methods.** To promote the messages of dual responsibility and need for dual protection against pregnancy and STD including AIDS, four Public Service Announcements (PSAs) were developed (30 seconds each) for television.
- Results.** Approval was received from the telecaster Committee of Canada for use in Public Service Announcements. Four out of five television stations in Calgary area are airing the PSAs. This is the first time a condom has been presented as part of a public health message in Canada.
- Conclusion.** A small outlay of funds (\$15,000.00 Can.) produced a top quality product. One of the four spots won the #1 Public Service Announcement in its category in Canada. Innovative, positive (media) messages including modeling of behavior are conducive to enhancing the knowledge base and preventive practices of the young adult.

- E.737** MEDIA DISTORTIONS OF AIDS: NINE YEARS OF MISPERCEPTION
Scherrie, Michael¹; Vowles, J.²
- ¹ Chair, Media Committee, AIDS Coalition to Unleash Power (ACT UP), New York, N.Y., USA;
² Member, Media Committee, AIDS Coalition to Unleash Power (ACT UP), New York, N.Y., USA; Freelance science writer.

Objective. To present a survey of media coverage of the AIDS epidemic and identify inherent biases and misinformation.

Methods. Both television and print media were analyzed; different reports on the same events were compared; points of view that were not mentioned were highlighted.

Results. While coverage of the scientific aspects of AIDS by the world's media has become more accurate over the course of the epidemic, it still lacks any real attempt to provide adequate social perspectives. The views of people with AIDS are rarely if ever taken into account, and most scientific evidence is taken at face value, with insufficient analysis and context provided. Methods have been created to remedy these problems, and to provide a more accurate and more rounded perspective on the global AIDS epidemic, and the many complex issues that surround it.

Conclusion. A decade of media coverage of the AIDS epidemic shows that balanced and educated reporting is rare.

- E.739** AIDS IN SWISS-NEWSPAPERS: REPORTING OF PREVENTIVE EVENTS AND DESIGNING THE IMAGE OF AIDS
Birncherer B., Richard J.E., Haenni, Dominique¹, Dubois-Arber F., Lehmann Ph.
¹Dpt socio. and Genéve; ²Inst. univ. de méd. sociale et préventive, Lausanne, Suisse.

More than 1500 different newspapers are printed in Switzerland. Since 1986 the Swiss authorities have launched a multimedia campaign under the slogan STOP-AIDS, associated with an important effort of stimulating multipliers such as regional authorities, schools, social and health professionals.

Objectives. Analyses of the 3776 articles about AIDS printed in 445 newspapers between Jan and Oct 1988 have 3 goals: 1. As a source of information about local actions, political facts or decisions, discriminative reactions in the different part of the country. 2. To describe the image of AIDS designed by press. 3. As a database.

Results. The main conclusions are:

- AIDS has been treated as any other topic by the press, but appears much more often and more regularly than the others (media report live every events and news of scientists concerning AIDS).
- The press plays a major role in designing popular beliefs about AIDS.
- Most reported events are not directly related to prevention but still have preventive effects.
- Persons with AIDS take a large place and are presented as "usual" patients who need care and compassion.
- Journalists are generally neutral, but don't take much care of contradictions appearing in or between the agencies' news.

- E.736** NOTES ON MEDIA PORTREYS: WHAT ARE THEY REALLY SAYING?
Birncherer, Joseph R.; Oberlin College, Princeton, N.J., U.S.A.
- Objective:** This study examines several recent Mass Transit Authority (MTC) advertisements for the rhetorical progression of Ideological development around AIDS, many of which have been documented by Ellen Hestor. This paper clarifies the relations between the MTC images and the cultural formations which they, ultimately, refer to. Their use of such tropes as the violation of the 'family', the femme fatale, danger in unexpected places, etc., illustrates the widespread psychic displacements occurring, whose symbols of four prevalent anxieties serve in other contexts.
- Methodology:** The study employs semiotic analysis to reveal these ads' rhetorical structures, while foregrounding the importance of social context in interpreting representation.
- Results:** The study found that these advertisements reinforce an underlying climate of unease which reflects displaced anxieties around AIDS.

- E.738** AIDS AND THE MEXICAN PRESS: IS IT USEFUL AS AN EDUCATIONAL MEANT?
Guzmán, L.; Blanca Encz, Maga, C., and Páez, G.
¹"El Regional" Center for the Documentation and Information about AIDS, CIRID/COAHUILA, MEXICO.
²General Directorate of Epidemiology, Ministry of Health, MEXICO.

Objectives. To analyze the response of the Mexican press to the AIDS epidemic from April to December 1988. This included the role of the Mexican press in educational meant, 370 articles on public opinion response to the educational campaign against AIDS.

Methods. Notes and articles were collected from the eleven most important national daily newspapers. Each role was considered as an analysis unit and quantitative variables were counted and analyzed using a SPSS-PC programme. For the qualitative variables content analysis was used.

Variables studied to know the frequency and the way the Mexican press is dealing with AIDS.

Results. The most relevant results are: 1) the average number of articles was 0.8 per day; 2) the information flow increased after the AIDS official campaign, because of the public opinion response; 3) the social groups that expressed an opinion related to the campaign were: public employees 59.7%, social associations 20.9%, civil associations 11.9%, political parties 5.9%, religious institutions 2.0%, and private organizations 0.5%; 4) in regard to the article content, 2.8% were about transmission; 4.7% about treatment; 18.2% had epidemiological information and 40% about the response of the public to the preventive measures the campaign proposed.

Conclusions. Although articles are being published correctly, the press is not acting as an efficient educational mean. Nevertheless, results show that the public opinion has reacted significantly, and so we consider that special strategies must be design in order to make the press a useful mean. The social discussion in this medium should be considered by the decision makers to orient the following steps of the campaign.

- E.740** Lakeshore School Board's Comprehensive AIDS Model
Shingleton, George; Bell, William
Lakeshore School, Lakeshore, Ontario, Canada

Objectives. To describe the implementation of a comprehensive plan which included the development of a policy, school based plan for high schools, students, professional personnel, for teachers, a community development strategy and a public awareness.

Methods. A report will be presented on the results of the Lakeshore School Board's mandate to develop a policy and an educational plan on AIDS 1987-1988. Correlation with representation from every group organizing fifteen major information seminars, and awareness group assemblies using films, brochures, informative literature, education kits, videos, and awareness and television coverage in the underwriting.

Results. Approximately 1200 employees, 1500 parents, and 4800 high school students were given the opportunity to learn about the deadly disease. AIDS awareness and literature coverage gave the Lakeshore School Board positive publicity to learn about this topic. Students' essays and projects offered encouraging feedback to the teachers and parents; comments were most reassuring that the committee must continue its work.

Conclusions. The Lakeshore School Board has proven that a grassroots venture without funding can have a transforming effect on the attitudes of the community and the general public. The Committee is committed to continue to educate its people about the magnitude of the disease and the prevention and being planned in the context of Family Life/Health sexuality curriculum this year. AIDS organized and planned great strides can be made. These findings will be available for the Committee.

SIDA ET MEDIA AU SENEGAL.
Dagnelid, Bernard. Université Laval, Québec,
Canada.

Objectif. Connaître l'image que véhiculent les médias sur le SIDA au Sénégal au moment du développement du Programme national à Moyen Terme de lutte contre le SIDA.
Méthode. Analyse des articles parus dans le Soleil de Dakar, au Sénégal, de 1986 à 1988.

Résultats. Entre le moment où le Soleil tirait à la une le 20 février 1986: SIDA: AUCUN CAS AU SENEGAL, et l'article du 4 juin 1988 sur le Soleil faisant état de 64 cas de SIDA recensés au pays, l'analyse de la couverture de presse nous livre les acquiescements suivants:
- Il n'y a pas de SIDA
- Les cas de SIDA viennent d'ailleurs
- Les médias dramatisent
- Le SIDA se développe
- Les premières préconisations sont d'accord bio-médicales
- Le SIDA n'est pas la seule urgence en matière de santé.
- Il faut combattre le SIDA.
- Les dimensions psycho-sociales de la maladie.

Conclusion: L'étude comparative de la couverture de presse du SIDA en France dans le Nouvel Observateur et au Québec dans le Soleil démontre que le pattern sénégalais se retrouve dans tous les pays présentant conscience du développement de la maladie sur leur territoire.

E.742

"Asian women and AIDS - research issues"

submitted by Sana-Yuana Tsou, PhD anthropologist, UNIDA

This paper identifies research issues on "Asian women and AIDS". It points out that current Information/Education for Health strategies need to educate prostitutes and women whose AIDS are often oblivious to the main problem of women and health - women's powerlessness. Sex tourism contributes to the vulnerability of women to AIDS, particularly as many prostitutes are children. At home, women are victims of "batterer cultures" and male standard values which put them in a communications "purdah" or veil. Even when confronted with health information about sexuality, they are not supposed to acknowledge it with a behavioural change such as asking husbands to wear condoms. Efforts to mobilize women at community level can brighten the picture but these have yet to have widespread support. The paper identifies a number of research/practice issues which would help AIDS programs to support women who are struggling to lift this communications "purdah".

E.743

THE EMOTIONAL IMPACT OF NEEDLESTICK INJURIES ON HEALTH CARE WORKERS

Morris, T. MacInnes, M. Strang, G. Schlich, Walter,

Dalhousie University, Victoria General Hospital, Halifax, N.S., Canada

Objective. To determine if a needlestick injury has an adverse emotional impact on health care workers (HCW).

Methods. Self administered questionnaire at the time the employee reported the injury and a supplemental questionnaire was completed two weeks following the injury.

Results. To date 54 HCW's have been enrolled. Seventy-four percent of the injuries involved contaminated needles. Two incidents involved patients with group IV HIV infection and 2 involved patients with hepatitis B. Immediately after the injury 74% felt the risk of developing HIV infection was low. At two weeks following the injury, 48% were worried about developing an infection; 18% had lost sleep due to worry and 5% had a change in appetite. The "feeling" regarding the accident consisted of anxiety - 40%, anger at one's self - 18%, depression - 24. One person had a decrease in sexual activity and another changed her method of contraception to condoms following the injury. Eighty-two percent discussed the accident with co-workers; 53% with his/her spouse; and 5% with their family physician.

Conclusion. The preliminary results of this study indicate that needlestick injuries have a significant emotional impact on health care workers. Our data suggest that occupational health departments, in addition to programs to prevent such injuries, must recognize and deal with the emotional impact of such injuries.

E.744

TITLE: THE WORKPLACE: LARGE ADVANCES FOR SMALL BUSINESSES
Schwartz, Beverly J. Williams,
U. S. CENTER FOR DISEASE CONTROL, Atlanta, Georgia, USA

Objective. This paper identifies and discusses leverage points, motivating factors and program successful in stimulating small businesses to educate employees about the prevention of HIV.

Methods. Needs assessment surveys have been used as the basis for designing education strategies responsive to small business needs and capacities. Professional membership organizations consisting of small business owners were enlisted to assist in the development of program content, structure, and initial implementation of the project's pilot phase.

Results. The program offered unique perspectives and approaches in identifying applications to a multiplicity of organizational structures. Evaluation methodologies for program usage by employers and impact on employee knowledge level and behavior will be discussed.

Conclusion. The worksite must be acknowledged as a vital target area, and utilized as a primary vehicle for communication of adult AIDS education and prevention programs. Indeed, the development of usable programs for this population appears to be a most important step in reaching a large segment of individuals who may effectively be reached only through their place of employment.

E.745

HEALTH PROFESSIONALS' KNOWLEDGE, BELIEFS AND ATTITUDES REGARDING AIDS IN RELATION TO ANOTHER ANXIETY CINDING FOR DEFERRED
University of Illinois at Chicago, U.S.A.

Objective. The AIDS epidemic has caused considerable anxiety among health professionals. Anxiety with high incidence has reported employee loss, absenteeism by medical students of certain hospitals and/or specialities, and high employee stress every three to six years. It is important to be able to discriminate those variables associated with anxiety in order to develop effective workplace responses to reduce stress, improve quality of care and patient care.

Methods. In this study, 536 physicians, nurses and social workers at University of Illinois Medical Center were surveyed and compared to ascertain the relationship between their knowledge, attitudes, and experience concerning AIDS in relation to caring for infected persons. Knowledge about AIDS was measured by self-rated knowledge level, and actual accurate knowledge. Experience included frequency, type, and level of contact with infected persons. Attitude variables included willingness to work on an AIDS unit, treating patients on a special unit, and willingness to treat persons with AIDS. Anxiety included by worry and doubt patients with AIDS, infection through their work, and infecting their families.

Results. Overall, attitudes were stronger indicators of anxiety than was knowledge and/or experience for physicians and social workers. For nurses experience with patients was also significant.

Conclusions. Professional role and responsibility must be addressed in the workplace in conjunction with worries about AIDS in order to facilitate reduced anxiety about caring for patients.

E.746

ATTITUDES OF MEDICAL TECHNOLOGISTS TOWARDS THE ACQUIRED IMMUNODEFICIENCY SYNDROME
Rosen, James W., Penney, K. S., and Gauth, R., Boche
Mimodical Laboratories, Erie, PA, Fairleigh Dickinson
Administration Institute, Rutherford NJ, U.S.A.

Objective. To assess the degree of concern medical technologists have towards the acquired immunodeficiency syndrome. **Methods.** We surveyed attendees at the annual meeting of the NJ Society for Medical Technology held in Liberty Park, New Jersey during April 1988. The survey addressed concerns, attitudes, knowledge and practices of medical technologists with respect to AIDS. Multiple choice questionnaires (281), utilizing a Likert scale, were distributed and a 74% response was obtained.

Results. Of those surveyed, 85.4% have friends or families who expressed concern about working with HIV positive samples; 25.9% are considering leaving the profession because of their fear and/or their "significant other's" fear of acquiring HIV in the laboratory; 45.2% would not have chosen the field of medical technology knowing they would be handling HIV positive samples; 71.0% currently wear gloves after most of the time or always when handling samples. **Conclusion:** We found a high degree of concern about AIDS among technologists. This may be a factor contributing to the current personnel shortage in medical technology.

E.747 AIDS-RELATED KNOWLEDGE, ATTITUDES AND PRACTICES OF GREEK DENTISTS

Antasia Rommelis, Kostasopoulos, J. Konstantinidis, R. and National Center for AIDS, Athens School of Hygiene, Athens Greece

Objective: To estimate knowledge attitudes and practices related to AIDS of dentists in Greece and determine responsible factors.

Methods: An anonymous questionnaire was sent by mail to a randomly selected 10% sample among dentists in Athens. Details about their demographic and scientific background, prophylactic measures during their competition and practical knowledge about AIDS were asked to be completed. Of the 349 who received the questionnaire 71.5% participated in the study.

Results: Of the participated dentists 59.4% were males, 51.5% were less than 40 years old and 18.5% admitted post graduate studies. More female (4.5%) than male (3.7%) of dentists always gloves. The use of gloves and masks was higher in dentists less than 40 years old (8.4% and 34.5% respectively) than in those more than 40 (26.3% and 18.7%). Of the Greek dentist 64.2% disinfected the high speed hand piece after treatment of every patient. Only 38.5% accept the therapy of HIV infected patients while 80.5% were well informed about AIDS.

Conclusion: High proportion of Greek dentists take precautions for themselves and their patients. Are well informed about AIDS but are not willing to therapy HIV infected persons. More education is necessary to improve their practices and behavior.

E.749 AIDS and Refusal to Work: A Canadian Experience

Thompson, Marlene Labour Canada, Ottawa, Ontario, Social Sciences and Health, Ottawa, Ontario, Canada

Objective: To describe the process of assessing refusals to work because of danger, when the danger consisted of a co-worker or client with AIDS.

Methods: Cases of refusal to work because of a co-worker with AIDS, in the Federal jurisdiction are reviewed and the ruling explained. Comparisons are made with cases in other Canadian jurisdictions.

Results: Up till now refusals to work because someone in the workplace has AIDS, have not been upheld.

Conclusion: Fear of contracting AIDS is a potent motivator for refusing to work with someone who has been infected, even when the contact with the infected person is minimal. Dissemination of information about the disease and its spread would prevent many of those incidents.

E.751 RECOMMENDATIONS FOR AN AIDS WORKPLACE POLICY

Ratoff, Lew, Gay Men's Health Clinic, New York, New York, USA

Objective: To provide suggestions for human resources policies for organizations involved in AIDS social services, research and education.

Methods: The role of institutions involved in AIDS services and research in addressing the issues of persons with AIDS in the workplace were considered.

Results: AIDS service and research organizations have the capacity and the responsibility to serve as models for employers in their communities, as well as a responsibility for the well-being of their employees. Demonstrating that persons with AIDS can and do continue to lead productive lives contributes to the creation of communities in which a diagnosed person can live fully. While difficult and costly, attention to AIDS in the workplace has important benefits for affected employees, their co-workers, the organization and the larger community. The involvement of the person with AIDS may enhance the effectiveness and sensitivity of education, research and support services. Most important, fair and effective treatment of HIV-infected employees provides a model of compassion and sensitivity.

Conclusion: Recommendations for establishing a relevant, effective PWA personnel policy include consideration of reasonable accommodations, employee benefits and the availability of support services.

E.748 A MODEL APPROACH FOR LABOR UNIONS AMID THE

HIV EPIDEMIC IN ALAMEDA COUNTY, CALIFORNIA
Informants: Frangou, Swain, E. M., Crane, B. M., Labor and Occupational Health Program (LOHP), University of California at Berkeley; East Bay AIC's Resource Organization; and Service Employees International Union (SEIU) Local 520
 *SEIU Local 616, Oakland, California, USA, **Highland General Hospital (HGH), Oakland, California, USA, ***HIV/AIDS Services Division, Alameda County, California, USA

Objective: To describe a public sector labor union's workplace efforts in directed HIV educational programs and in creating and expanding HIV services in Alameda County, CA.

Methods: SEIU Local 616 has organized a collaborative effort utilizing union, community, and county government resources to educate the county's workforce; to expand HIV clinical services; and to improve access to quality care.

Results: 1) Shop steward training in HIV transmission, occupational safety, and education/prevention. 2) Collaboration with hospital management at Highland General Hospital in training all workers regarding HIV transmission, prevention and workplace safety. 3) Organize a Gay and Lesbian Caucus within local 616 to address HIV and other issues in the workplace. 4) Political action around HIV funding allocations. 5) Establishment of HIV outpatient services at Highland General Hospital.

Conclusions: Labor unions can organize and reinforce workplace education efforts; lobby local government to support comprehensive HIV services; and provide a focus for important gay and lesbian, minority, and community concerns.

E.750 AIDS EDUCATION IN THE WORKPLACE

*Ray-Kell, L., Donner, Ann M. Seattle, King County Department of Public Health, Seattle, WA, USA; **University of Washington, Seattle, WA, USA*

Objective: To educate the King County workforce about AIDS, and to evaluate the effectiveness of this training on knowledge and attitudes.

Methods: As part of a county-wide policy on non-discrimination for people with AIDS (PWA) in the workplace, a voluntary AIDS educational was offered to all county employees on work time. The one hour sessions consisted of an oral presentation, a videotape and a question and answer period. A pre and post test was administered to the first 1000 participants.

Results: Approximately half of the 5000 persons workforce chose to attend one of the 70 presentations given in 1988. In general, those surveyed showed a high degree of basic knowledge about AIDS. For instance, over 91% answered correctly on the pre test that a person risks infection by sharing intravenous drug equipment, that women can pass the virus to male sexual partners, and that an infected pregnant woman can pass the virus to her unborn baby. Areas in which there was less knowledge included: the ability of bleach to kill HIV, the safety of sharing eating utensils with a PWA, the risk of infection from blood transfusions, and the safety of latex condoms compared to natural skin condoms. An average of 39% correctly answered these questions on the pre test. After the presentation, an average of 59% answered correctly. Those who would not work with a PWA decreased from 40% before to 24% after.

Conclusions: A one hour educational can significantly increase knowledge about AIDS and alter attitudes about working with a person with AIDS.

E.752

FEAR OF AIDS IN THE WORKPLACE
S. Francis Goodrich, D. Mathur, S. and Addy, C. University of South Carolina School of Public Health, Columbia, South Carolina, USA

Objective: To determine the level of fear and misconceptions about AIDS in the workplace.

Methods: In a major university in southeast U.S. responded to a university-wide AIDS survey. The measurement instrument used was a questionnaire with questions regarding their general knowledge and personal attitudes related to AIDS. Data on demographic information and job position were also collected. A general knowledge score and an attitude score were calculated for each subject.

Results: 31% were "very concerned" in the situation "being served in a restaurant by a person infected with the virus". 30% were "very concerned" being "near an infected person while they sneeze or cough". 24% were "very concerned" in "using an infected co-worker's personal belongings", and 22% from "drinking from a water fountain used by an infected person". Staff non-supervisors had a higher level of fear and concerns about AIDS.

Conclusions: Fear of AIDS in the workplace exists due to various misconceptions about AIDS. Extensive AIDS education efforts must be conducted to provide facts and to calm down fear and hysteria which may disrupt the workplace.

E.753 **INTV/AIDS AND INTERNATIONAL ORGANIZATIONS: A STAFF AND DELEGATE HANDBOOK**

Editor: Nancy L. American Red Cross, Los Angeles Chapter, 8700 Wilshire Boulevard, Los Angeles, California 90057, U.S.A.

Objective: To describe the process and present a sample of the result of development of a multinational HIV/AIDS basic education and anti-discrimination pack for use by international organizations.

Working in the Secretariat of the League of Red Cross and Red Crescent Societies in Geneva, and in cooperation with WHO, the author has involved League staff members and staff from other Geneva-headquartered non-governmental organizations to develop an appropriate educational programme for staff members and field delegates in international service.

Results: The resulting pack includes a self-questionnaire, scripted slide presentation, case studies, questions on non-discrimination, interviews with persons undergoing the HIV test in Geneva, resource list, workplace HIV bibliography and the newly-developed League HIV/AIDS policy for the workplace.

Conclusion: League of Red Cross and Red Crescent Societies has a tested programme designed to help staff and delegates work appropriately with HIV issues in their workplaces and prevent HIV/AIDS-related discrimination.

It's Your Job: A Three-Part Plan To Control Infectious Diseases

Miller, Dr. E. Harry
Director of Education, Fredericton, New Brunswick Canada

Objective: To explain how a school system has informed employees of the basic public health principles that govern infectious disease control in schools.

Methods: A sixteen page brochure has been prepared for all school board employees. It provides specific direction under such headings as How Should I Deal With AIDS in the Classroom?, How Can I Protect Myself Against AIDS?, What You Don't Have To Worry About.

The document provides a model for any school system that is concerned about providing accurate information to their employees. The publication has been endorsed by the Canadian Public Health Association. The publication will be available in limited quantity.

E.757

THE SAFE HANDLING OF HIV-POSITIVE BIOLOGICAL FLUIDS IN THE ANALYTICAL CHEMISTRY LABORATORY

P.A. Lewis and D.B. Garcia, Reston Corporation, U.S.A.

Although biological fluids have long been handled in the analytical chemistry laboratory, official guidance relative to their safe handling have only recently been disseminated by the U.S. Occupational Safety and Health Administration (OSHA).

While the possible exposure to biological agents has always been present, greater concern has surfaced as a result of the AIDS epidemic. Further, the need for analytical chemistry laboratories to handle biological samples from AIDS clinical research trials presents a special case since all samples are known to be HIV-positive. Presently there is much reluctance by laboratories capable of conducting drug disposition studies to handle known HIV-positive samples and thus we have designed containment facilities and developed standard operating procedures (SOPs) for these activities. The containment laboratory used for this activity operates under negative pressure and is governed by a series of SOPs. The SOPs address the following activities:

- General work practices, policies, and procedures;
- Packaging and transporting of specimens;
- Receipt and transfer of specimens to sample control;
- Sample log-in and storage;
- Laboratory clean-up, decontamination, and disposal;
- Emergency procedures for surface spills and personal contamination; and
- Decontamination of biological waste.

In addition to the general SOPs above, a safety protocol relative to the specific analytical procedure to be performed is formalized. This protocol focuses on possible hazards peculiar to the analytical procedure.

E.758

THE IMPACT OF AN AIDS EDUCATION PROGRAM IN THE WORKPLACE

University of South Carolina School of Public Health, Columbia, South Carolina, USA.
By: Franciscano, Richter, Mathur, S and Addy, C.

Objective: To measure the effectiveness of an AIDS education program for employees in a university workplace.

Methods: A university-wide AIDS education program was implemented in a major university in southeast U.S. from January-May 1984. 596 employees, grouped according to their job positions, attended two-hour AIDS education sessions conducted by a medical epidemiologist and a health educator. Pre and post test questionnaires, consisting of knowledge and attitude questions, were completed by the participants. Pre and post test scores were calculated for each employee. Data were analyzed using the chi-square test, paired t-test, and ANOVA.

Results: Before the educational program, the mean knowledge score was relatively high. There were misconceptions regarding the cause, cure and transmission of AIDS. Many employees were concerned about getting AIDS in low or no risk situations. After the program, there was statistically significant improvement in both knowledge and attitude scores of the employees.

Conclusion: This AIDS education program in the workplace was found to be effective with improvement in both the knowledge and attitudes about AIDS among the employees.

Blood Control in Brazil

Jurberg, Claudia; Galvão, Bernardo; Silva, Edmilson*
Oswaldo Cruz Foundation, Rio de Janeiro, Brasil

Objective: To realize an analysis, together the Brazilian authority government, the population and together the press in general, about aids transfusional Brazilian situation. What is the government actuation? The Brazilian press contributed with the elucidation the problem? And the population have conscience the important of voluntary blood donation?
Methods: It is an work of scientific journalism with objective is, through interview with authority government, scientist, technical science, journalist and the population, establish the blood control situation in Brazil, during a period.
Results: A new Brazilian constitution, promulgated in 1988, prohibit a blood sale, but any government measure will be realize. The blood have been selling and the Brazilian population ignore the danger with blood transfusional.

E.761

A MODEL OF COMMUNITY SUPPORT FOR PEOPLE WITH HIV DISEASE
Mergles, E.*; McKenna, P.**; Kohl, J.**; Lemire, L.*; W. Turner, R.*. *Coordinator, AIDS Community Care Montreal (ACCM), ** Administrative Council, ACCM, QMADA

Objective: To provide community based, psychosocial and practical support to people affected by HIV.
Method: Developing, writing and publishing a comprehensive layman's guide to coping with HIV related conditions. Providing one to one support by trained volunteers, counselling, self help support groups, an information library and emergency financial assistance.
Conclusion: This type of support is beneficial and helps people cope both physically and emotionally with HIV related illness.
Results: We maintain an average of twenty clients at a time, indicating a strong need for this type of program.

E.763

DIFFERENCES IN AIDS RISK ASSESSMENT (ARA) COINCIDING BEHAVIORS OF PRIMARY CARE PHYSICIANS IN COSTA RICA AND HARRIS COUNTY, TEXAS

Cavallini, John Velasco, C. Luzz, L., Arrufin, J. and Thornley, J.
 Baylor College of Medicine, Houston, Texas, USA.

Objective: To assess whether there are significant differences in attitudes and ARA/counseling behaviors of Costa Rican and Harris County physicians.
Method: In this study, we obtained responses from 48 Costa Rican physicians at a medical conference to questions we had previously used to assess the ARA/counseling behaviors of physicians in Harris County Community Health Centers. The questionnaires were translated into Spanish by one of the co-authors who attended the meeting. These responses were compared to the responses of 47 primary care physicians from the health centers using the general linear model program of SAS.
Results: Significant differences ($p < 0.05$) were found on 22 of the 43 questions. Costa Rican physicians report being more comfortable asking patients about their sexual preferences and practices and that they counsel patients on how to reduce their risk of AIDS at a substantially greater rate than Harris County physicians. Costa Rican physicians also report feeling more responsible for ARA/counseling.
Conclusions: There are cultural differences in physicians behaviors and attitudes about sexual and drug history taking and counseling which may reflect differences in medical training as well as cultural differences in attitudes about appropriate physicians behavior.

E.760

DEEP REEVALUATION CASE REPORT: THE CASE OF GENICLOVIR
Eliou, James; Long, J.; Harrington, M.; Pomarato, M. AIDS
Coalition to Unleash Power, New York, New York, USA.

Objective: To evaluate flaws in the current drug approval process in the U.S. through analysis of the "genocivir" story.
Methods: An analysis of all the anti-cytomegalovirus (CMV) genocivir protocols, of published data on genocivir and of the minutes of the Food and Drug Administration (FDA)'s Anti-Infective Drug Advisory Committee and interviews with ophthalmologists and people who have CMV. Results: In October 1987, the FDA's Anti-Infective Drug Advisory Committee, ignoring the advice of its two ophthalmologist members, voted to recommend against marketing approval for genocivir to treat CMV retinitis in immune-suppressed people. It did so even though evidence gathered under a "compensatory use" protocol showed genocivir to be as effective as improving CMV retinitis, which is a severe progressive disease that leads to blindness in nearly 100% of untreated patients. The vote, in effect, mandated a controlled clinical trial to establish the drug's efficacy. The trial began in January 1989.
Conclusion: Genocivir, proven effective against CMV retinitis, should have been approved in October 1989. Efficacy trials for a drug that has been proven effective waste resources, put patients at indefensible risk, and limit access to an effective therapy.

E.762

SIDA ET SOCIÉTÉ: RÉFLEXIONS SUR LA PRATIQUE ANTHROPOLOGIQUE INTERNATIONALE
Bismont, Jacques Brunerfat

Introduction: Les réflexions sur la pratique des anthropologues s'inscrivent à la situation critique causée par le développement du SIDA.
Méthode: Observation-participants dans des congrès scientifiques, des séminaires entre collègues et des recherches sur le terrain en tant qu'individu et chef d'équipe.
Résumé: La crise du SIDA offre aux anthropologues un terrain privilégié pour avancer la production des connaissances. On y mène des recherches sur le processus des changements sociaux, les rapports entre la maladie et la société, l'économie politique et les modes et tenter de nouvelles approches méthodologiques. Certains entendent contribuer à la recherche des solutions aux problèmes de prévention. D'autres seient consacrer leurs recherches de base ou d'application, les recherches sur le SIDA présentent une série de contradictions qui soulèvent des problèmes de méthodologie et de responsabilité professionnelles.
Conclusion: La pratique de l'anthropologie est une action sociale par excellence qui met les chercheurs devant des choix parfois difficiles et mène à des réflexions critiques.
Mots-clés: épidémiologie, responsabilité, réflexivité, anthropologie.

E.764

IMPACT OF A SLIDE ASSISTED PRESENTATION ON THE KNOWLEDGE ABOUT HIV-INFECTION IN INSURANCE EMPLOYEES
Eissel, Suzanne, Bismont, Jacques, Long, J., Retouche, A., Harlow, B. and Gossel, P.D. Medizinische Fakultät der Universität

Montreal, Quebec, Canada
Objective: To assess the present knowledge about AIDS in insurance employees and to investigate the effect of a single educational talk.
Method: A questionnaire with 10 questions concerning AIDS was filled in by 192 insurance employees before and after a slide assisted presentation on relevant items of HIV transmission. The results were compared by χ^2 test.
Results: 190 and 185, respectively, of the questionnaires were returned. The percentage of wrong answers before and after (X²) the presentation were 1. You can get AIDS being in the same room with a person with AIDS (1/1) BE. 2. AIDS has been transmitted through sharing office equipment (3/0) BE. 3. The virus which causes AIDS has been transmitted through saliva (5/7) p < 0.001. 4. AIDS is transmitted by sneezing (2/1) p < 0.01. 5. AIDS is an easily transmitted disease (21/8) p < 0.001. 6. There are reports of casual transmission of AIDS to family members who are not sexual partners of people with AIDS (31/3) p < 0.01. 7. People can look and feel healthy and still transmit the virus (10/7) BE. 8. If you inject drugs with your own needle and never share it you cannot get AIDS from shooting drugs (14/7) p < 0.05. 9. You can get AIDS from donating blood (46/16) p < 0.001. 10. There is a vaccine to prevent AIDS (10/10) BE.
Conclusion: There is still a considerable lack of information even among educated middle class people. Slide assisted presentations may have a significant impact on the knowledge about HIV transmission.

E.705 AIDS AS A PROCESS
Cordero, F.; Coronado, A., Arredondo, C., Gil, E.,
Ministry of Health, Spain.

Objective. AIDS is not a unique and irreversible fact, but rather a process in which society as well as the individual can and should participate.
AIDS is a "relatively controllable process" in which the attitude of the subject and society are the key for combating and preventing the possible development of the syndrome, and thus "give time" (a variable fundamental in the process) for science to find more efficient solutions than those that already exist.
Conclusion. AIDS as a process allows us to define the stages and aspects of the disease over which science already has knowledge and answers to those others that are still being investigated, which would permit public opinion to regain its confidence in scientific discourse.

E.706 THE DOUBLE CONTAGIOUSNESS PHENOMENON: FROM SEROPOSITIVITY TO PSYCHOPOSITIVITY
Cordero, F.; Coronado, A., Arredondo, C., Gil, E.,
Ministry of Health, Spain.

Objective. As can be seen from the analysis of the attitudes the population carried out by means of representative surveys, we are confronted by a dual "contagiousness", the most important from the point of view of the development of the disease, which must be fought by science and healthy education. But, on the other hand there also exists the "psycho-social-contagiousness" of fear, of irrational attitudes, that lead to segregation and social racism. Eliminating this phenomenon is fundamental to be able to cope with the disease and develop information campaigns (prevention) which upon now have been the only real means of fighting this problem.
Conclusion. The report develops the concept of "psychopositivity" (fear, rejection, isolation...) as one of the major sources of difficulties in the fight against AIDS. Psychopositivity creates "regression", which leads those affected to turn their backs on the health system, to hide themselves to avoid greater complication, to look for parallel solutions, to not take care of themselves, to abandon the system, all of which are negative for themselves as well as for society.

E.707 ACCEPTANCE AS A PRE-CONDITION FOR AIDS-PREVENTION AMONGST
I.V. DRUG USERS

Dr. Ingo Michels, Deutsche AIDS-Hilfe e.V., Nestorstraße 9-9,
D - 1000 Berlin 31

There is at the moment no data for the prevalence of HIV that is accurate because the necessary scientific and social network is missing. Also there are no uniform standards for the determination of regional differences in respect of the first appearance of HIV, the methods of application of illegal drugs, different needle-sharing practices, varying levels of availability of sterile needles and syringes and condoms, scantest information on the sexual behaviour of i.v.d.u. etc. The existing studies amongst groups in prisons, treatment centers and hospitals indicate an increased incidence which threatens to increase if the necessary preventive measures are not provided and carried out expeditiously. The Deutsche AIDS-Hilfe calls for the de-institutionalization of those affected, the development of low threshold treatment opportunities without therapy and substance demands, subsequent professional support with adequate financing, needle-exchange programs and distribution of condoms (also in prisons). Further no forced testing in the granting of places in drug rehabilitation, controlled substances with methadone for those i.v.d.u. at risk of infection along with those already HIV-infected or suffering from AIDS and the incorporation of a care-dimension for HIV-infected and AIDS-ill persons, d.o. into the existing therapy programs including a possible personal care until death. The Deutsche AIDS-Hilfe calls in answer to the often catastrophic state of health of i.v.d.u., estimated between 80,000 and 100,000 of which probably 30% are already infected. A call which must be followed by a sense of humanity which will defend against alienation and stigmatisation.

E.708

E.709 "EDUCATION ABOUT AIDS" COURSES, VICTORIA, AUSTRALIA
Giles, Ian; Jones, J.; "Glover, D." and Lewis, P.,
Health Promotion Unit, Health Department Victoria, Melbourne, Victoria
Australia, **Social Biology Resources Centre, Melbourne, Victoria, Australia,

Objective. To evaluate the impact and outcomes of a series of 6 day multidisciplinary AIDS education programs designed for health, welfare and educational professionals.
Methods. Various tools have been used to evaluate these courses. These include knowledge and attitude questionnaires as well as in depth interviews with selected course participants.
Results. In the period June 1985 to December 1986 16, 4 day "Education About AIDS" courses have been held in both country and metropolitan regions of Victoria. Over 540 people have completed these courses; the participants coming from a wide range of health, welfare, education and community groups. Knowledge about AIDS has been shown to improve significantly during the duration of the course (approximately 6 weeks) and is maintained at these levels 3 months following completion. Participants report that they are more comfortable and confident in communicating with others on AIDS and issues of sex and sexuality. Course participants have shown skills in undertaking many AIDS initiatives e.g. policy development, educational sessions and community education on employment issues. Participants show a positive attitude to needle sharing, in relation to AIDS related issues. v.g. towards people infected with HIV and IV drug use issues. **Conclusions.** These training programs have been shown to have a major impact on AIDS awareness and prevention activities in the state of Victoria.

E.770 EN MILIEU DE PREVENTION

Uladis Vaidas, World Health Organisation
Regional Office for Europe/Copenhagen-Denmark
Paris, France

-Afin de pouvoir prendre une décision responsable et avertie, nous avons besoin:

- De connaissances sur le comportement sexuel sain qui implique des choix et des responsabilités.
- D'une éducation sexuelle efficace qui est saine, réaliste, pragmatique, non moraliste, éducation qui valide la sexualité comme un aspect positif de la vie, qui réduit la peur, donne des informations claires et honnêtes et qui met l'accent sur les pratiques sûres d'être sexuel et offre des comportements alternatifs à considérer.

- Souligner, dans la transmission des messages efficaces pour les relations sexuelles saines, l'importance du langage utilisé, d'attitude réceptive, de qualifications interpersonnelles et de communication.

- Viser dans les programmes d'enseignement des pratiques sexuelles saines dans toute la communauté des différents groupes de la population, utiliser différents types d'information selon le groupe et préparer des solutions éducatives ou de précautions nécessaires afin de limiter le nombre de personnes infectées et de réduire les conséquences de l'infection.

- E.771** PROBLEMS IN THE INTERFACE BETWEEN THE MEDICAL TREATING SYSTEM AND THE PATIENT/FAMILY SYSTEM
Peter John
The Ackerman Institute for Family Therapy, New York; New York, USA
- Many medical management problems occur in AIDS patients because of poor relationships between patient/family and the medical system (doctors, social workers, nurses, administrators, etc.). The Ackerman AIDS Project, by using psychotherapeutic and educational techniques with many individuals, couples, and families and members of the medical systems, has been able to show improvement in these relationships. For instance, many individuals, families, and health care workers believe the equation AIDS=DEATH. This is in spite of AIDS being seen by the writers and by many members of the medical community as behaving more like a chronic illness. When patients' and families' percepts of AIDS has been psychotherapeutically shifted from FATA, to CHRONIC, they feel and act more hopeful; they are likely to be more compliant to treatment protocols and to take better care of themselves. Normal activities of living can be resumed once the illness is seen in a different perspective. Patients and families often feel empowered to ask more questions of the medical treating system and to be less passive about their illness. To create a shift in perception, we must place emphasis on basic information and education about AIDS. Ignorance and misinformation about the disease, anxiety, isolation, and guilt that surround AIDS make education about everything from testing to treatment essential. It is a time-consuming, repetitive process which requires a high degree of expertise.

- E.773** INNOVATIONS IN AUSTRALIAN NURSING
Barbara Joy
Private Palliative Care Services Pty Ltd, Adelaide, South Australia, Australia.

This paper traces the growth of an Australian nursing innovation: a professional service to meet the needs of those suffering a life threatening illness. Private Palliative Care Services Pty Ltd (PPCS) was created to provide a health care option for individuals wishing to live in ways that are personally meaningful and significant. Professional nurses assessed by PPCS practice as private primary nurse practitioners in meeting the physical, intellectual, emotional and spiritual needs of patients. A key feature of their practice is third party reimbursement from a major private health insurer in the form of a Palliative Care Benefit. The development of the Company required considerable effort and expertise. Professional and political lobbying at a range of levels was necessary to ensure a legitimate place in the health care system along side well established public systems. On going education programs provide support for the palliative care nurses as well as necessary revenue to meet office expenses. Details of Company structure, cost effectiveness and the practicalities of establishing a private nurse practice are discussed. It is believed that the PPCS model of practice holds international potential and interest for nurses.

- E.775** PSYCHOLOGICAL SUPPORT SYSTEM FOR PEOPLE WITH HEMOPHILIA AND HIV IN THE FEDERAL REPUBLIC OF GERMANY

Jan Schäfer, Herbert Specht, Deutsche AIDS-Hilfe e.V., Nestorstr. 8-9, 1000 Berlin 31, West-Germany

Objective: To develop new and practical educational counselling strategies and support systems for hemophiliacs in the FRG. Methods: In cooperation with the Hemophilia Treatment Centres (HTCs) Deutsche AIDS-Hilfe and hemophiliacs with HIV regular meetings were held to design a concept for support system. Results: Although 50-80 of the estimated 8,000 hemophiliacs in West-Germany are HIV-antibody-positive the lack of a non-doctors controlled support system became evident. There is a need for self help groups to talk about social and sexual problems in an open private atmosphere without a doctor's guidance. Conclusion: The hemophilia support system should be utilised from medical treatment centers. The existing network of 80 local AIDS help groups in the Federal Republic can offer the limited number of hemophiliacs the infrastructure for non-therapeutic and interpersonal self-help groups. More data will be presented at the conference.

- E.772** PRIMARY HEALTH CARE FOR HIV-INDUCED HEROINE
Kirschbaum, David; Ely, J. and Long, J. AIDS Coalition to Unleash Power, New York, New York, U.S.A.
- Objective: To discuss the availability of primary care (baseline health care) for HIV-infected people.
Methods: We interviewed physicians, researchers and government officials and analyzed data on trial enrollment and epidemiology.
Results: Our research indicates that there is a two-tiered health care system in the U.S. Some patients with economic resources receive primary care consisting of regular medical visits, AZT and PCP prophylaxis. A second group, economically deprived, receives little or inadequate primary care. Participation in clinical trials is generally restricted to those who have received primary care. We will focus on the obstacles to obtaining treatment in New York City as a specific example. Conclusion: The U.S. government should be meeting a standard of baseline health care for all HIV-infected people, consisting of regular medical visits, AZT and PCP prophylaxis. In addition, the government should rigorously enforce equitable access to trials.

- E.774** Culturally Sensitive Care at Minimal Cost Through In-Home Health Attendant Care.
Shirley L. LPA, APA, CST*, Addison, Constance**
*California State University, Hayward, California, USA, **San Francisco State University, San Francisco, California, USA
- Objective: Providing optimal, culturally sensitive care at minimal cost to People of Color and Others with AIDS.
Methods: Use of in-home, hand-picked and trained home health attendants within a system of comprehensive case management offers cost effective care in a setting where quality care can be assured/insured. An interdisciplinary team consisting of program director, nurse case manager, social worker, home health coordinator and attendants provides a higher morale and more continuity of care than case management where services are "farmed out." Data collection regarding time and costs can also be monitored more effectively when most services are in-home.
Conclusion: As care for AIDS clients becomes increasingly costly and draining, the in-home home health attendant model adds greatly to team spirit while cutting costs so that more clients may be helped. The MBA program, overseen by an interdisciplinary team, is very effective in providing quality, culturally sensitive care to minority AIDS/ARC clients. Results: More clients are seen; costs are minimized; morale is enhanced.

- E.776** DISCRIMINATION OF MALE AND FEMALE PROSTITUTES UNDER THE ASPECTS OF AN INCREASING SOCIAL CONTROL IN THE CONTEXT OF AIDS.

Micela Rippe, Deutsche AIDS-Hilfe e.V., Nestorstr. 8-9, 1000 Berlin 31, West-Germany.

Objective: In order to fight against prejudice prostitution must be prohibited as a normal profession and the health consciousness amongst prostitutes must be clearly shown.

Methods: The experiences of all organizations of Federal prostitutes are to be taken into consideration including the evaluation of existing results on voluntary and compulsory HIV-tests as well as the numerical development of sexual transmitted diseases in the years 1985 to 1987.

Results: Prostitutes cannot be considered a relevant group for the transmission of HIV-infections and further sexual transmitted diseases. Male and female i.v. drug users who get their money for drugs by prostitution do have other living conditions.

Conclusion: A precondition for the stabilization of the health status of prostitutes is the acceptance of prostitution as a profession of one hand and a continuous information and education of the male population about the necessity of safer sex on the other hand.

Le SIDA, la société et le comportement AIDS, Society and Behaviour

E.777

LE SIDA, UN PROBLÈME DE TOUTES
AMÉRIQUES, MÉTRIC : Nougradd, B.
Comité Ciudadano Anti-SIDA de Madrid/SPAN

Objectif. Définir les stratégies des organisations non-gouvernementales et des mouvements sociaux, face à l'information et prévention du SIDA.

Méthodes. Les expériences dérivées des activités quotidiennes du Comité Anti-SIDA de Madrid, à travers les programmes d'information, des conférences, des colloques, des soins directs avec les porteurs, malades et sujets que leur comportement rend vulnérables à l'infection à VIH.

Résultats. Après deux ans de l'expérience acquise après cinq ans d'existence, on a constaté la prise de conscience de la population, les changements d'habitudes, des soins sanitaires plus attentives; mais encore on peut rassembler des situations de discrimination et refus à l'égard de personnes infectées par le VIH ou soupçonnées de l'être.

Conclusions. Les mouvements sociaux contre le SIDA en Espagne ont joué un rôle très important pour éviter la progression du virus et pour assouvir cette maladie comme une simple maladie, sans aucune autre connotation.

E.779

AIDS PATIENTS AND THE USE OF ZIDOVUDINE HIV DRUG THERAPY
IN COMMUNITY CENTERS OF CANADA
Jackson, J. and Fleming M.*
Toronto General Hospital, Toronto, Canada

Objectives. To examine the relationship between patients' involvement with AIDS community organizations and the use of experimental drug therapies obtained outside of the country.

Methods. Semi-structured interviews were carried out with 25 AIDS patients in three major centers in the province of Ontario.

Results. Of the 25 AIDS patients interviewed, 7 are/are have been involved with obtaining experimental HIV drug therapies from outside of Canada. All 7 patients are gay men but only 4 are (or were) actively involved with AIDS community organizations, and 3 are knowledgeable of the activities of such organizations although they are not actively involved. 6 of the 7 patients indicated that their physicians recommended seeking drug therapies from outside of the country, seven of the 25 patients interviewed are gay men who are actively involved with AIDS community organizations. Of these only 4 have obtained drug therapies from outside of the country. One has chosen to be "drug free" against the strong recommendations of their physicians.

Conclusions. There is no necessary relationship between patients' active involvement with AIDS community organizations and obtaining experimental HIV drug therapies from outside of Canada. Preliminary research indicates that a combination of factors including knowledge of AIDS community organizations' activities and physicians' recommendations play a role in determining patients' involvement with such drug therapies.

E.781

PROGRAMME OF ASSISTANCE TO RELATIVES OF PATIENTS CARRIERS OF HIV
IN PORTUGAL. P.F. WELLS, A. BUCHS, M. DE
TANZI, P. E. - Hospital e Maternidade Ceão Piêrro de Pontifícia Universidade Católica de Campinas-S.P.-Brasil.

OBJECTIVE: This programme of assistance to relatives of patients carriers of HIV in the Infectious Disease service of HMC-FUCAMP.

METHOD: We ring of groups of relatives with multidisciplinary team that takes part of physicians, nurses, psychologists and religious, aiming to give support and technical and psychosocial explanations.

RESULTS: 1. For the professional team, the confrontation with relatives diverted responsibilities and alleviated the anxiety that the professional AIDS includes. 2. We succeeded with the patient to the familiar environment, extending the acceptance initially found in the multidisciplinary team. 3. We observed wide interest of the relatives in discussing and assimilating the AIDS question.

CONCLUSION: This meeting results in gains for the relatives, patients and principally for the multidisciplinary team. We think, therefore, that such event could extend to the community in general (Public Health Centers and District Entities).

E.778

MODEL PROGRAM: COLLABORATION OF PRIVATE AND PUBLIC HEALTH
SYSTEMS ON OUTPATIENT SERVICES
LITVINSON, RADIN M.* Rosenthal Susan*, Rosenber,
Ellen*, Ernst, Jerome R.S.P., Bronx-Lehman Hospital Center, *New York
City Department of Health.

Objective. To link two (2) separate health systems centered around AIDS care in the South Bronx.

Methods. The majority of AIDS patients served by Bronx-Lehman Hospital Center are primarily IVDA's and homeless. The hospital has established an active outpatient center to manage these patients after hospital discharge. The Department of Health New York City has begun an active anonymous counseling and testing program for self-referred clients. A testing center has been set up in the same building as the hospital's AIDS clinic. With the opening of this center talks were begun between the Commissioner of Health's staff and hospital's AIDS Team with the goal of presenting duplication of services and thereby, identify gaps in services and the development of needed services.

Results. Close collaboration with Health Department clients who test positive are immediately seen at the hospital's AIDS Clinic for followup medical care. Clinic patients, referred from hospital outpatient centers are referred to City Site for HIV testing and counseling. This program has functioned over six months. Approximately 100 city referred clinic patients have been seen in the hospital clinic and 200 have been found to have reduced immunity.

Conclusion. Close collaboration between private and public sector is working in this linkage in the South Bronx.

E.780

THE STOCKHOLM MODEL - INFORMATION STRATEGIES AND CAMPAINS TO
SUPPORT THE COMMUNITY INTERVENTION WORK.
App. Anna-Martin, Stockholm County Council Aids Prevention Project

Objectives: To let the information unit within an aids prevention project support, facilitate and guide the work with community intervention. A close collaboration between information service and aids prevention work.

Methods: To put an information unit with educated people within a health education project and work close together. The information unit supports the people in the project who work with our four main target groups: young people, health and medical staff, immigrants/refugees and homo- and bisexual men. The information unit leads the project going by giving services through our information centre to all the 5,000 people that we have educated within the project. We provide them with brochures, videos, books, exhibitions. We run seminars to keep their interest on top. We produce a paper "Tajpall". We formulate the messages and advertise in newspapers, local papers and we organize public activities.

Results: To let an information unit work directly within a project makes the projects message more clear and makes the needs of information strategies more clear. The project can very quick get an answer on what is possible to do regarding to information strategy. It also facilitates and guides the long-term work with community intervention work. We have within one and a half year reached 5,000 people which we now provide with all kind of information at our information centre.

E.782

Fluoresc. Prototype, Organizational and
Law Sheet.

Sandwal, Chris. - Shanti Project California, U.S.A.

OBJECTIVE: How to empower human beings with the optimum measure of life while facing life-threatening extinction through AIDS.

METHODS: Shanti Project grew out of the Apollo II mission which put the first man on the moon. Apollo II individually worked at peak performance to exceed all notion of human expectation.

Both Apollo II and Shanti Project evolved experientially without a prototype. At Shanti the experience of AIDS became the teacher while the caregiver and the cared became the pupils.

CONCLUSIONS: What people learned experientially in their quest to go into outer space gave permission to those same people to go into the inner space of human feelings which peaks in the final stage of human maturation, prior to life transition.

RESULTS: Civilization and its institutions attempt to limit the expression of human emotion with the institutions of family, faith and community. In the final analysis it is human emotion which allows people with AIDS to face the saturation of their lives.

VIDEO FILM SCREENING — ALICIA
Alicia, Rebecca S.

National Institute on Drug Abuse, Rockville, Maryland USA

The National Institute on Drug Abuse announces the availability of a video produced by the Latino Community/ETC in Los Angeles through a NIDA grant with the Georgetown University Child Development Center. Alicia is a dramatic portrayal of a woman who learns that she and her child test positive for the human immunodeficiency virus (HIV). In an emotional scene she confronts her husband about his drug using behavior which caused the HIV infection. The meaning of HIV, AIDS, and modes of transmission are described in a clear, concise manner. The videotape is produced in Spanish. Drug counselors and health professionals can use the videotape to educate Hispanic women and men who are at risk for AIDS because they are sexual partners of intravenous drug abusers or are drug abusers themselves. The videotape comes with a leader's guide and can be used as a "trigger" film to stimulate discussion about AIDS. The videotape is for adult audiences and is not appropriate for school prevention programs. The videotape is 20 minutes long.

E.802

POTENTIAL RISKS OF ULTRAVIOLET RADIATION (UVR) IN HIV INFECTION.
FARIZ, Peter, J., D.O.I., Memorial Hospital, MOONSHIRE, U.K.

OBJECTIVE: To determine the differences in recreational UVR exposure and the knowledge of its effects in HIV seropositive and in those not at risk of HIV in the light of reports that both DNA/UVB radiation are immunosuppressive and that UVR can activate HIV expression.

METHODS: Questionnaires were answered by 58 male homosexuals seropositive for HIV (11 with AIDS or ARC) and 51 controls matched for gender but not from an at risk category for HIV infection. Skin type was assessed from reported response to UVR.

RESULTS: Skin type and mean age did not differ between groups (HIV positive, 26.6 years; controls 24.8 years). HIV positives had significantly greater regular annual or solarium exposure than controls (20.7h vs 6.5h, p<0.05) and greater exposure to natural sunlight sufficient to tan or burn the skin over a 4 year period (11.5 weeks vs 3.3 weeks, p = 0.06).

CONCLUSIONS: Knowledge of the harmful effects of UVR was similarly poor in both groups ("personal health improved": 64% vs 57%; "immunity improved": 71% vs 23%). Only 60% of HIV positive and 53% controls thought UVR exposure could cause skin cancer. 65% of HIV positive also thought UVR exposure could improve the outcome of their HIV infection.

CONCLUSIONS: Knowledge of the harmful (photocarcinogenic and immunosuppressive) effects of UVR is poor. Greater exposure among HIV positive may partly be due to misconceptions that it might improve health and the reduction of HIV infection. HIV positive should be warned to reduce unnecessary UVR exposure in view of the theoretical risks involved.

E.803

INFORMATION, PREVENTION, EDUCATION ETABLIR UNE THEORE PREALABLE
A L'ETABLISSEMENT DES STRATEGIES DE SANTE PUBLIQUE
FERRAZ, J.J. Bello, P. Paris, France

PARC/SA/SDA "Institut Pasteur, Paris, France

OBJECTIF: Affiner et renforcer les actions et les politiques des organismes non gouvernementaux. **METHODE:** Informations détaillées des demandes, analyse permanente des données, suivi, interview. **RESULTATS:** Analyse de la situation française de 1985 à 1989 révèle une évolution: une absence de volonté politique, de moyens et de contrôle dans la prévention du SIDA, un système palliatif fondé sur le médecin, sans évaluation préalable, et évaluation publique des résultats; une certaine généralité entre les causes des formes infectieuses, prévention, succès, formation, et éducation. Une évaluation régulière des demandes formulées et des besoins ne permet pas de définir une stratégie et d'adapter clairement, dans partie information, éducation, et distribute selon une hiérarchie verticale (médecin/patient, parents/médical, professeur/élève, pharmacien/clients, etc.) et d'autre part la prévention, c.à.d. un ensemble de savoirs, de techniques, de comportements, partagés par des individus en situation d'égalité (étudiant, couples, classes scolaires, membres d'associations, groupes sociaux, etc.) Dans ce cadre, la formation et l'évaluation relevant de demande générale de l'information, même si l'évaluation peut utiliser des techniques photographiques tendues sur l'échiquier.

Les difficultés de faire passer effectivement des informations, et contenues une charge cognitive liée à la mort, et des messages de prévention liés à la gestion du plaisir et à la vie, rencontrent de fortes résistances. Elles rattachement à la fois le passage de l'information, et l'acceptation de comportements de prévention, que la réduction des "campagnes de prévention" à la publicité pour les préservatifs ne favorise pas en plus la prise en compte de ces difficultés à penser à l'PARC/SA/SDA affiner son action. Les données se sont après difficiles, et l'efficacité des documents ne des interventions apparaît réduite. **CONCLUSION:** La certification des notions d'évaluation de prévention semble, en France, être un préalable à toute campagne réussie ou stable.

E.806

EDUCATION, INFORMATION, COMMUNICATION

MARY F. OWON, OJO UNICOR, UDAHARA, P.O. BOX 7847, KAMPALA, UGANDA

BACKGROUND

AIDS was identified in Uganda in 1982. The National AIDS Control Programme was formed in 1985. In May 1988 the National School Health Education Programme, Ministry of Education, introduced a Primary Science syllabus with UNICEF assistance with AIDS as one of its topics under STD. This syllabus was designed by an internationalist Panel formed in 1985. A new science in Secondary schools was organized because of the great threat of AIDS to young people in Uganda. Doctors and Educators were identified and trained in each District. From March 1988 the trained teams have been going around schools educating children and the community about AIDS.

METHOD

For each session a talk, illustrated with visual aids is given on History, Statistics, Modes of transmission, Socio-economic implications, Myths and misconceptions, available tests and Prevention of AIDS, followed by a question-answer discussion period.

IMPACT AND CONCLUSIONS

By face-to-face interaction the teams are able to communicate information that the students had not received through other channels and correct misconceptions. It seems that there is a real breakthrough in the fact that many students and the community feel free to discuss sensitive sexual issues openly. Communication between children and parents in the area of education. These were quite improved. By March 1989 the Programme will have introduced in all 24 Districts comprising of 1000 Primary and 600 Secondary Schools. Over 1,000,000 people have been made aware. The School AIDS Education Programme is being very well received throughout the country.

E.804

E.806

KNOWLEDGE, PERCEPTIONS AND ATTITUDES CONCERNING AIDS AMONG UNIVERSITY STUDENTS/STUDENTS FOR AN EDUCATION PROGRAM.
Wesley, J. Lewis, L., "Madame Barbara, Wesley H.", (Paris, Wesley A.), UNIVERSITY HOSPITAL, FEDERAL UNIVERSITY OF RIO DE JANEIRO.

OBJECTIVE: To provide information for health educational program based on real status of knowledge, perceptions and behavior related to AIDS among university students.

METHODS: Four hundred students of the Rio de Janeiro Federal University were interviewed and answered 41 questions each one. To analyze the results, chi-square, t-test and higher correlations were inferred from these questionnaires with stronger associations. Finally, the epidemiological and prognostical profiles were defined and reported.

RESULTS: 65% of students, although aware of transmission and prevention were correctly answered by 75% of all students. There was however a significant increase of students and correct answers about the transmission of HIV by heterosexual active and/or passive direct contact.

CONCLUSIONS: The results of the study showed that the majority of students had a high level of information about AIDS from TV, newspaper, books, scientific reviews and others. The perception of the problem is distorted by a false and fear. Being AIDS a disease related to sexuality and death, students very difficult to deal with in terms of changing habits and behavior. New Educational Program is based on one methodology based on these issues.

ADOPTION OF CHILDREN FROM HIV POSITIVE WOMEN
CORLETT SANDY*, K SKINNER**, G O'HARA**, S Fowler*, J Mox**
*Health Health Council, Social Work Department, Edinburgh
**Lothian Health Board, Edinburgh

Objective: To describe the placement in adoptive families of children born to HIV positive women.

Methods: Adoptive families were recruited from 2 sources 1) Foster families already caring for a child. All foster parents are informed and prepared to care for a child at risk of HIV, and some volunteered. Their strength of feeling for the child led these families to want to adopt. 2) Adoptive families specifically recruited for children at risk of HIV. All prospective adopters are informed about HIV, and told about children with special needs, including children at risk of HIV. Some families responded.

Results: 4 children have been adopted. All are now HIV negative with good health. Extensive pre- and post-adoption placement includes medical advice, special support group, hygiene advice, practical help, financial stability. Issues are: dealing with the uncertainty of caring for a child who may become ill and die; confidentiality; what to tell the child.

Conclusion: Adoptive families have been found without special advertising for foster parents and prospective adopters. Informing all carers about HIV is crucial. Our experiences have informed development of an HIV screening policy for some child placements. Consideration of relatives as adopters of children whose parents die is a future issue.

E.808

SUPPORTED ACCOMMODATION FOR PEOPLE WITH H.I.V. RELATED ILLNESSES OR A.I.D.S.
(S.A.T.A.)

John Muller*, E. Houghton and P. Davies - Lothian Region Council Social Work Department, Edinburgh.

Objectives: To outline our experience of developing a range of supported accommodation resources within the community.

Methods: Through the use of small regional and housing association properties using a specially negotiated contract between ourselves and the Association. We aim to provide dispersed housing, with support which meets the needs of people with A.I.D.S./A.I.S.S. Most tenancies to date have been shared by two persons, with single rooms. All are furnished to a high standard. A gay couple are to provide lodgings for someone with H.I.V. have also been assessed and accepted as to our scheme. This development was achieved through advertising, public contacts and negotiations with lease plans with individual housing associations, and housing providers. Contact with housing agencies has not had the time. It is achieved as a result of active discrimination for people with A.I.D.S./A.I.S.S. through direct tenancies involving a support agreement and secondly, to relate the use of A.I.D.S./A.I.S.S. For housing agencies and promote good practice.

Since October 1987, we have developed 10 such tenancies, and are offering support to 18 people although we are in the process of negotiating further single tenancies and supported accommodation for single parents and their children. We are working in the main with current or ex-H.I.V. drug users, but in one instance, have a mix of ex-drug user and gay man. The support available is on a rotating basis, and centres on the practical and medical means by which people with A.I.D.S. can remain in the community.

E.809

A COMMUNITY PROGRAM OF COMPREHENSIVE CARE FOR HIV DISEASE
PAYNE, P., FLETCHER, D., **BARNETT, CAROL**, SHAW, J.***
*Goldersboro, **Worlington,***Fairfax County Health Dept.,
Fairfax, Virginia, U.S. RIVERS, VIRGINIA, VIRGINIA, U.S.A.,**
***Community Services Board, Fairfax, Virginia, U.S.A.

Objective: To establish an interdisciplinary community based program for staging and case managing HIV infections which will prolong lives and slow the spread of HIV in the community.

Methods: The Fairfax County human services agencies, i.e., Health Services Board and Social Services have developed a voluntary program to provide education, continuing medical care, and psycho-social support to asymptomatic individuals infected with HIV. Patient sources are from the County's case-finding activities, the substance abuse program, private medical practitioners and hospitals. This program is linked to Fairfax Hospital's HIV Center to provide the broader scope of care required for HIV case management. The program is 2 tiered; tier 1 consists of the County's interagency case management program (CMP) with primarily CDC Group 11 and III. CMP provides every 6 months a social case, mental health, and medical evaluation including HIV p24 antigen and p22 microglobulin assay. As the disease progresses to CDC Group IV, medical case responsibility shifts to tier 2, i.e. the Hospital's HIV Center which also serves the larger medical community.

Results: To date more than 200 cases monthly CDC Group IV have been followed by the medical staff of the Hospital's HIV Center. More than 30 cases have entered CMP during the first 18 months of operation.

Conclusion: We recommend that communities faced with serious drug abuse and/or STD problems consider similar programs.

E.810

The development of community-based AIDS initiatives
CORNE, D., CAMPBELL, M., EISEL, D., HARRIS AND M. HAZELL. THE
"WITCHES" Nightingale Trust (1977), London, England.

Objective: To maintain a strong community based whilst developing, and professionalising the work of non-governmental organisations (NGOs) in response to the AIDS crisis.

Method: TWI is the first UK, and the largest European, NGO concerned solely with TB and AIDS. Services are provided by members of the community for one another. Since 1982, when TWI was founded, increasing numbers of community based initiatives are developing in the UK to access their own community groups.

Results: The most effective health education occurs when community groups provide their own education - this is appropriate to the groups' existing behaviour, acknowledge obstacles to change and presents risk reduction as a positive alternative. This work is based in communities defined by area, institutional groupings or, more commonly, shared characteristics (eg sexuality, gender, age, use of drugs, ethnic groupings). Support services need to be organised according to the person's medical diagnosis, or relationship to the diagnosed person (eg buddies for people with ARC/AIDS, HIV support groups, liver's support groups, family support networks). In community based organisations develop in numbers of clients, staff and volunteers, the services (education and support) must be increasingly professional, but not become distanced or lose their community base. These must complement statutory services rather than replace them.

Conclusion: Community based organisations work on a level with people and by sharing skills and resources with statutory services we can avoid duplication and use our abilities more fully for a comprehensive response to the health crisis.

E.811

STATE OF THE ART MEDICAL CARE FOR AIDS PRISONERS
MELIN, ERIC, SAYFEN, J., BRALOW, C., MONTPELIER MEDICAL
CENTRE, HEALTH SERVICES, QUEBEC, N.Y. USA

Objective: To describe the medical needs of ambulatory AIDS prisoners and the complex policy considerations necessary in managing their care in a prison.

Methods: A 40-man open dermatology for prisoners with CDC defined AIDS was organized for the delivery of prophylactic and medical health services on Rikers Island NYC. Rikers Island houses NYC inmates awaiting trial or who have been sentenced for periods that may vary.

Results: In the first 25 months 61 patients were cared for with a median age of 33 and median duration of diagnosis of AIDS prior to incarceration of 6 months (0-20). Major diseases experienced historically by our patients included: PCP, 4 CNS TOXO, 3 large cell lymphomas, 1 B cell lymphoma, 2 extrapulmonary TB, 1 PML, and 1 cryptococcos meningitis. 8 patients were discharged to the hospital and did not return as of December. 15.7 patients had a history of TB and an additional 10 were PPD positive, 10 had evidence of sputal smear history or screening blood test. A maximal temperature greater than 102 F was observed 3 times per 100 patient-days.

The treatment of AIDS patients in the prison is fraught with conflicting objectives. The prison is a place of confinement and punishment while the physician's role is to heal and to relieve pain. The patient wants to improve his medical condition but also may benefit from appearing rehabilitated when considered for compassionate judicial release. Physicians wish to relieve legitimate pain even if pathology is not demonstrable, but they resist behavior perceived as purely drug seeking in nature.

Conclusions: AIDS patients can live most of the rest of their life in prison. One group's approach to the many challenges of prison AIDS care will be reviewed.

E.812

UN APPROVE INTERPERSONNELLE E LA REDUCTION DES RISQUES
SEXUELS E L'UPTAZIA CENTRALE

AYRES MORGAN, Nils Engdahl, BARNETT, N. Hertz et Brown A. Schopf,
Projet COMBINATION, Kinshasa, Zaïre.

La population adulte de Kinshasa, dans sa grande majorité, n'est âgée que de 19-30 ans. Le SIDA était une maladie fatale, transmise au grand public par relations sexuelles avec des partenaires infectés. Néanmoins, pas de gens à risque fréquents les comportements qui réduisent considérablement l'infection et beaucoup ont vu leur vulnérabilité. Cette conclusion est basée sur des entretiens, auto-évaluations, cultures, cognitives et psychologiques. Elle présente une stratégie qui peut servir différents groupes dans la prévention à grande échelle de la transmission de l'infection.

Basé sur les résultats des recherches ethnographiques, les ateliers furent organisés en utilisant des méthodes d'engagement actif. Les expériences structurées aidèrent les participants à analyser leur situation et à se sentir suffisamment dans les années à venir. Cette méthode de communication peut être utilisée par des organisations gouvernementales, des réseaux d'information, des services de santé et des groupes en conjonction avec des campagnes de communication de masse.

SECTION F

Droit et éthique
Ethics and Law

Colloque Symposium

Droit et éthique Ethics and Law

Vue d'ensemble de la législation sur le SIDA Global Survey of AIDS Legislation

M.F.O.1 THE HUMAN RIGHTS CONTEXT OF AIDS LAW
Justice Michael Kirby, Member, Global Commission on AIDS, Sydney, Australia.

In this paper, the speaker will stress the context of developing human rights jurisprudence within which national and subnational legislation dealing with AIDS and HIV must be developed. This is necessary not only because derogations from such norms diminish the effectiveness of such laws as measures for individual behaviour modification. It is also necessary because such norms are often legally binding on states and are morally binding as providing basic rules to be respected because of the very humanness of the person affected and his or her family and friends. The Global Commission on AIDS in its first report emphasized the necessity for WHO and national programmes and laws on AIDS to be developed with full knowledge of and compliance with universal human rights norms. These include rights to privacy, to establish a family, to move freely in international travel etc. Derogations from such basic rights must be provided by law, be proportional to the risk and limited strictly to what is necessary to prevent the spread of the HIV infection. Measures for public health do not provide a blanket exemption from compliance with basic rules of human rights.

M.F.O.3 STATE AIDS LEGISLATIVE AND POLICY TRENDS 1983-1988
Kane, Mona; Morrill, DM; Ryan, CC; Bridgman, R; and Bewing, L

AIDS Policy Center, Interdepartmental Health Policy Project, The George Washington University, Washington, DC, U.S.A.

Objective: To describe the response of state legislatures to the epidemic from 1983-1988 and to analyze the evolution of state AIDS policy on key issues affecting confidentiality, discrimination and prevention and the delivery of services. **Method:** All bills and laws were collected from all state legislatures from 1983-1988. They were analyzed by category, frequency and content from both a legislative and health policy perspective. **Results:** Since 1983, more than 1,450 bills and 314 laws have been passed by state legislatures. Categories reviewed include: testing, discrimination, confidentiality, health care services, financing, education and public health measures. More legislation has been introduced and passed regarding HIV testing than in any other area with related activity in areas of confidentiality and required disclosure. States are using AIDS to update their public health laws in terms of managing communicable, infectious and sexually transmitted disease. State handicapped laws and new provisions are being used to protect patients and providers from AIDS-related discrimination. Some states are taking a comprehensive approach to managing AIDS through omnibus legislation. A wide range of provisions including criminal penalties, due process for existing quarantine provisions, penalties for anonymous testing and for health care providers are being added. **Conclusion:** Almost all states have passed AIDS legislation. Level of legislative activity does not always correlate with case incidence. Overall, final state actions evidence a measured, balanced, non-partisan response.

M.F.O.5 AIDS IN COURT: IMPORTANT QUEBEC DEVELOPMENTS
Lettellier de St.-Just, Louis, Montreal, Quebec
Canada

M.F.O.2 IMPLEMENTING HIV/AIDS LEGISLATIVE POLICY FOCUSING ON ETHICAL ISSUES IN A NATIONAL HEALTH CARE SYSTEM
Petersen, Matthew; Member, H.C.'s; Sheip, R.*; Storr, R.*; Swahn, R.*; Allan, E.*

*Department of Veterans Affairs, Washington, D.C., USA. **Foundation for Interfaith Research and Ministry, Belaire, Texas, USA.

Objective: To implement sound Federal AIDS legislation focusing on significant ethical issues in the largest health care system in the USA. **Methods:** In May 1988, the President signed Congressional legislation specific to the care of veterans with HIV infection/AIDS in the Veterans Administration. This legislation addresses significant ethical issues well subject to diverse opinion such as privacy and confidentiality of medical records; nondiscrimination in admission and treatment; self-determination; a voluntary testing program which incorporates the principle of justice and resource distribution. Broad policy direction including a system wide consent form has been sent to all health care facilities. A national training program on HIV/AIDS counseling and prevention education has been used as a forum to standardize the information process. **Results:** Two counselors/educators from each facility in the system attend the course. The application of policy is discussed within the framework of ethical considerations every counselor should think about, such as mutual respect within moral pluralism, personal morality and professional limitations, professional duties, honesty in presentation of information; accuracy and consent and confidentiality and the Chorny Issue of spouse/partner notification. **Conclusion:** Despite a lack of moral consensus on some issues, legislation based on ethical issues can be implemented on a national scale.

M.F.O.4 THE LIMITS AND PROSPECTS OF AIDS LEGISLATION IN ANGLOPHONE AFRICA
AMANUEL, ABDOU IDEK, DANAN, SENEKAL.

OBJECTIVE: To survey and analyze the effectiveness of existing AIDS legislation in Anglophone Africa.

METHOD: Content analysis of existing health laws and AIDS legislation.

RESULTS: In most Anglophone African countries, specific legal instruments for dealing with AIDS prevention are lacking. Where AIDS-related laws exist their application to the epidemic of AIDS is weak. The greatest potential for appropriate (i.e. humane) and effective AIDS legislation seems to be in those countries with better organized public health services, greater public awareness of the epidemic, legal sensitivity to the epidemic, and a tradition of human rights legislation.

CONCLUSION: There is an urgent need for effective and appropriate legislation to deal with the prevention of AIDS in Anglophone Africa. Fulfillment of this need will help to significantly reduce the social stigma and criminalization of AIDS and HIV victims.

M.F.O.6 A GLOBAL SURVEY OF AIDS LEGISLATION
Gottlieb, Lawrence O. Harvard University, School

Koucher, Bernard. Paris, France.

M.F.O.15 INTERNATIONAL CODES OF RESEARCH ETHICS: SHOULD HUMANISM
 AND HUMANITY BE SUSPENDED DURING THE AIDS EPIDEMIC?
Annan, Chester J. Law, Medicine & Ethics Program, Boston University
 Schools of Medicine and Public Health, Boston, Mass., USA

Objectives: To establish the basis of international codes of research ethics and their relevance to AIDS drug and vaccine research today.

Methods: The basis for the Nuremberg Code and the Helsinki Code will be examined with a view toward establishing the universal principles contained in these Codes are their applicability to research conducted during an epidemic, and research conducted in countries that had not participated in the formulation of these Codes.

Results: Based on this analysis, it is possible to explain the legal and ethical bases of existing international codes of research ethics, including their "natural law" basis which would render their universal applicability. Special attention is properly focused on the principles of self-determination (autonomy) to be safeguarded by informed consent; nonmaleficence, to be safeguarded by adherence to reasonable scientific principles in research design and execution; and justice, to be safeguarded by fairly distributing the risks and benefits of the research.

Conclusion: The AIDS epidemic does not justify a suspension of the codes that safeguard human rights in medical research.

T.F.O.1 CONFIDENTIALITY AND ITS LIMITS: OVERVIEW OF THE ISSUES.

Closen, Michael L. Chicago, Illinois, USA.

T.F.O.3 THE OPTIMA OF AIDS ON THE DEATH CERTIFICATE

Knox, Michael, B.

Institute of Psychiatry, De Crespigny Park, London SE5, U.K.

Death registration became constitutional law in England and Wales in 1836 and physicians have been urged ever since to accurately record the cause of death. Until the advent of AIDS, more liberal attitudes in society had reduced the stigma of most causes of death as an obstacle to their accurate certification. AIDS or HIV infection will usually appear on the Death Certificate as the condition leading to death or as another associated condition. This has major ramifications for the bereaved and may have particular implications for surviving family members with regard to placement of children in foster homes.

For historical reasons death records in most countries of the world are public documents and provide no safeguard for the privacy of sufferers after death. Patients with AIDS encounter many social and psychological problems and thus the importance of confidentiality has been established in guidelines provided by bodies such as the American and British Medical Associations. In the USA there have been calls to adopt a two part death certificate, mainly for purposes of medicine delay for relatives pending further clinical or autopsy information. However greater privacy would also result with a two part certificate, one of which, without stating cause of death, could be used for the local and civil necessities after death.

T.F.O.5 AIDS AND THE CANADIAN PRIVACY ACT

Orszak, John, Privacy Commissioner of Canada, Ottawa, Ontario, Canada

Significance of the Study. The study described the impact of Canada's Privacy Act on the collection, use and disclosure of AIDS-related information about individuals. The level of confidentiality afforded this information may affect the degree of discrimination experienced by HIV-infected persons and may also affect the rate of spread of HIV infection. The study seeks to strike a balance between individual privacy and the legitimate needs of government to collect, use and disclose some types of AIDS-related personal information.

Methods. The study reviews Canadian government policies and practices for dealing with AIDS-related information about government employees, the general public and government clients (such as immigrants or penitentiary inmates). These policies and practices are assessed against the requirements of the Privacy Act about handling personal information. They are also assessed against the practical need to use some types of AIDS-related personal information to understand the syndrome and to combat the spread of HIV infection. It also addresses privacy concerns relating to HIV antibody testing.

Results. The study recommends measures to regulate the collection, use and disclosure of AIDS-related personal information. The recommendations will be useful for other jurisdictions attempting to strike an appropriate policy on the treatment of AIDS-related personal information.

T.F.O.2 X v Y (1988): WHEN IS CONFIDENTIALITY A LEGAL RIGHT? MORRIS,

JULY LEGAL OFFICER, THE TORONTO HOSPITAL TRUST LEGAL COUNSEL.

UNITED KINGDOM
Objective: To review the legal right of confidentiality to see when it is overridden by the public interest exceptions either to protect others or the freedom of the press.

Methods: When is information legally confidential as opposed to just private? Examination of legislation and case law in the UK. Clinical information identifying people with AIDS in confidential files, NHS (1 Regd) 1974, and the case of X v Y (1988). There is a primary duty to the patient to keep medical information confidential. However, it is legally advisable to breach confidentiality to serve the wider public interest of protecting others. Only when there was a clear infection risk could a doctor be legally liable for failure to disclose.

Conclusion: X v Y (1988) 2 All ER 648, was a English court case concerning two doctors who had AIDS. A newspaper obtained the confidential hospital records identifying the doctors but the court granted an injunction restraining publication. The judge said that the confidentiality of the hospital records was more important than protecting the public from theoretical risks posed by the doctors, and the freedom of the press to publish such information.

T.F.O.4

AIDS AND PRIVACY: RETAINING, RESTRICTING OR
ABANDONING MEDICAL CONFIDENTIALITY?Closen, M. Patricia*, Morissette, J.-P., Gilmore, N.,
Somerville, N.*

*Centre for Medicine, Ethics and Law, McGill University, Montreal, Quebec, Canada.

Confidentiality of HIV/AIDS-related personal information (HIVAPPI) has suffered from: (i) increasingly vacuous content of medical confidentiality in era of institutional medical care; (ii) inability of formal law to control effectively flow of personal information. Further legislative regulation of medical confidentiality therefore unlikely to produce greater protection. Balance should be placed on increasingly articulate soft law (guidelines, policy, protocols) to formulate precise measure of protection accorded particular category of HIVAPPI. Reasons proposed are: a) systemic potential not been exploited, each embodies inherent degree of protection. Measures of protection are: (i) unlimited, providing absolute protection; (ii) anonymous, allowing control exclusively by subject of information; (iii) coded, allowing control by designated individuals only; (iv) partial, necessarily accompanied by stated further measures of protection. Mandatory, exclusive use of these measures of protection in all institutional settings will: concentrate attention on HIVAPPI; prevent reliance on ineffective content of confidentiality; provide courts with precise standards to measure alleged breaches of privacy and damage. Paper suggests application of measures to number of categories of HIVAPPI. Method capable of extension to all personal medical information

T.F.O.6

MEDICAL PRIVACY FOR THE HIV-INFECTED INDIVIDUAL
Hochstetler, Gail, Administrator, AIDS Legal
Referral Panel, San Francisco, CA, USA.

Partial listing of 1988 conferences

I. National AIDS Law Conf., S.F.	400 Participants
II. Nev. Public Health Assoc., Las Vegas	100 Participants
III. University of California, S.F.	1,000 Participants
IV. Concern for Dying, N.Y.	50 Participants

Objective: To explore the lack of confidentiality protections for persons with HIV infection and generally to describe the decline of medical privacy.

Methods: Review of the concept of confidentiality within the physician/patient relationship. Examination of AIDS Legal Referral Panel case studies of health care providers' violation of Calif. confidentiality laws that resulted in injury to the patient. Analysis of limited exceptions to the general rule against disclosure of private medical information, including disclosure (1) after patient consent, (2) to institutional staff, (3) to hospital visitors, (4) to a foreseeable victim of serious harm (Tarasoff), and (5) to others where health laws require.

Results: Despite the strongest confidentiality protections of any US state, examination of pre-1989 California legal cases indicates erosion of medical privacy for HIV infected persons. **Conclusion:** Communications between patient and care provider can no longer be considered confidential.

OLIVIER DE CLERMONT
CLINIQUE PÉDIATRIQUE L'ACTUEL, MONTRÉAL
QUÉBEC, CANADA

LE PATIENT DIFFICILE

Cinq prototypes de réactions des patients au diagnostic de séropositivité au VIH ou de SIDA sont abordés. La négation, la manipulation, l'agressivité, la dépression et la panique sont des réactions auxquelles les médecins ont à faire face. La dynamique patient-médecin engendrée par ces réactions est nouvelle à cause en partie du caractère imprévisible de l'évolution des aspects cliniques, psychosociaux et scientifiques reliés au VIH.

Ces réactions forcent désormais à une nouvelle approche du médecin qu'il est urgent de définir pour la survie du médecin et du patient devant l'intolérance sans cesse croissante d'une partie de la société et d'une partie du corps médical face au SIDA.

Devant l'absence de vaccin et de traitement efficaces, la confiance aveugle de la société envers les médecins s'estompe progressivement et tant que les médecins persisteront à se protéger derrière leurs armes thérapeutiques, le regard critique posé sur eux par la société s'accroîtra.

Droit de éthique Ethics and Law

Infection par le VIH, reproduction et fonction parentale HIV Infection, Reproduction and Parenthood

T.F.O.17 Overview of the Issues
Bernard M. Dickens, Faculty of Law and Faculty of Medicine,
University of Toronto, Canada. MSB 203

Key ethical issues in HIV infection and reproduction arise at different stages of pregnancy. They include:

- 1. Initiation of Pregnancy:** Counseling of the HIV-positive woman about risks of pregnancy to her health-directive or non-directive; advice about risks of HIV transmission to fetus; access to reproductive assistance - genetic donation, in vitro fertilization, etc; screening donated gametes/donors for HIV; access to safety of contraceptive sterilization.
- 2. Maintenance of pregnancy:** Access to health services, pre-natal care, etc. for the HIV-positive woman; counseling on continuation/termination of pregnancy.
- 3. Termination of pregnancy:** Access to abortion services and counseling; health care during and after delivery; risk to uninfected child of natural delivery - risk of infection by passage through birth canal-untreated cesarean delivery; post-natal care of HIV-infected child.
- 4. Post-natal Issues:** Prohibition of breast feeding uninfected child - child abuse; foster parent/adoptive parent of infected/uninfected child-confidentiality and the (parental) right to know.

T.F.O.19

SHOULD HIV POSITIVE WOMEN HAVE CHILDREN: AN ETHICAL PERSPECTIVE.
Arora, John D., Montefiore Medical Center - Albert Einstein College of
Medicine, Bronx, New York, USA

In order to halt the perinatal transmission of HIV, advocates of a "public health" model of counseling contend that infected women should be strongly urged not to have children. Advocates of a "genetic counseling" model, on the other hand, argue on moral and practical grounds for a supportive, "non-directive" approach. This paper provides an ethical analysis of these competing claims and perspectives, and offers an alternative counseling model described as "respectful confrontation".

The ethical core of the debate turns on the question whether perinatal transmission of HIV constitutes a "threat" or "harm" to the infected child. This question is approached through an application of the "wrongful life" argument as analogous with other devastating (genetic) diseases (i.e. Sickle, cystic fibrosis). Then the factor of risk and uncertainty is addressed. Is a 25-35% chance of infecting one's child with a potentially lethal virus an unreasonable or irresponsible risk? While acknowledging such cultural diversity in perceptions of childbearing and risk, I note that infecting need not continue such arbitrary perspectives if the well-being of children is threatened.

Finally, the implications of these moral analyses for counseling are explored. I argue that if perinatal infection with HIV constitutes a harm or wrong to the child, and if the risk of transmission is judged to be very high, then "directive" counseling is not necessarily coercive or unethical. However, cultural differences warranting counsel from counsel we might advise this approach. In order to assure future infants from undue suffering we might prefer to cultural differences, I advocate counseling that respects an infected woman's latent preferences for childbearing, that counsel is her at least to save the problem as a genuine moral dilemma, before supporting her final decision.

ETHICAL DILEMMAS IN PEDIATRIC AND MATERNAL AIDS

Mallickozhy, Anne, Wright, A. and Novello, A.

National Institutes of Child Health and Human Development,
National Institutes of Health, Bethesda, Maryland, USA.

Objectives: To describe ethical dilemmas which are specific to pediatric and maternal human immunodeficiency virus (HIV) infection and disease.

Methods: The Secretary of the U.S. Department of Health and Human Services commissioned a major initiative to examine issues pertaining to pediatric and maternal AIDS in the U.S. The departmental experts who participated in this six-month long project identified a number of ethical concerns in this area.

Results: Areas of concern identified included: (1) the participation of infants and children in clinical trials; (2) the participation of women of childbearing age in clinical trials; (3) the right to prepare women of screening for infection; (4) confidentiality issues in testing and treating adolescents; (5) the conduct of clinical trials in pregnant women; (6) delivery of care to hard-to-reach populations.

Conclusion: The AIDS epidemic has generated a number of problems unique to this disease entity.

T.F.O.20

**UNINFECTED CHILDREN OF INFECTED WOMEN - THE
FOSTER CARE DILEMMA**

*Landman, S. - SUN Health Science Center at Brooklyn,
Brooklyn, New York*

HIV infection in women creates a dilemma of the family. Not only is the woman infected, but her newborn is potentially infected, her husband often ill with HIV disease and her health suffering rather severely as a consequence of her illness. As infected women become ill, require hospitalization or die, the necessity of caring for their uninfected children will increase the burden on society and increase the risk of emotional and developmental damage to these children. This problem will be most acute in cities where infected rate (DR) is as numerous (e.g. Newark, NYC, New York City, Burlington (N.C., Baton) These men serve as the caregiver for the infection of women. New York City has an estimated 35,000 infected women each with average of 2 children/year (at time when HIV infection is first diagnosed). This means that over the next several years 70,000 children will be at risk of losing their parents. Often these children become orphans and end up in foster care because they live in single parent homes or the father has already died of AIDS. The foster care system of NYC currently cares for 21,000 children. How the potential addition of thousands or tens of thousands of new children into the foster care system will be handled remains unexplored. The problem is further complicated by social doctrines that place the highest priority on the biological mother's rights over her child and the foster care concept of making decisions "in the best interest of the child". In the social milieu wherein HIV declines "in the next few decades are often in conflict. More attention must be focused on the care of uninfected children of infected women if the social and human damage of the epidemic are to be minimized.

T.F.O.22

HIV INFECTED CHILDREN IN THE COMMUNITY: ETHICAL PROBLEMS

*Medkin, Ruth,
Albert Einstein College of Medicine, Bronx, New York, USA*

Objective: To offer an ethical analysis of emerging problems regarding children with HIV infection in the community. **Methods:** Cases are presented that pose ethical issues of confidentiality, school and pre-school placement, parental rights, and needs of children. Cases are drawn from the ongoing work of a multidisciplinary team established to deliver services to HIV-infected children and their families.

Results: Special problems arise when the need to preserve confidentiality conflicts with the "best interests" of children. Despite negative consequences of "labeling" children with AIDS, identification may be necessary in order for children to be eligible for special services or entitlements. Several potentially conflicting rights are identified: rights of the biological mother, of foster parents, of the HIV-infected child. **Conclusion:** The chief ethical value should be "the best interest of the child," thus requiring subordination, when necessary, of competing values such as confidentiality of HIV information.

**Prévenir la transmission du VIH : les conflits religieux en matière de santé publique
Preventing HIV Transmission: Religious Conflicts in Public Health**

W.F.O.15 "SAVING LIFE AS AN OVERRIDING DEMAND"
(A JEWISH PERSPECTIVE)
W. Gunther Plaut, Toronto, Ontario, Canada

Jews see the source of their moral demands as springing from their relationship with God. While not all Jews agree on what this relationship betokens, there are some common views which may be applied to the subject of the Conference on AIDS:

Life is precious and must be preserved under all circumstances and at all costs. While ordinarily the ends do not sanctify the means and the religious law must not be infringed for otherwise desirable purposes, it is different when it comes to the preservation of life and, by implication, the prevention of pandemic disease.

Prevention of HIV transmission may involve providing means for sexual activity which in itself is frowned upon by much of Jewish tradition. The liberal view (taken by the presenter) holds that the preservation of life must be tantamount, and that all possible support must be given to programs which will prevent people from becoming infected and from infecting others.

W.F.O.20 BAVARIA: A REVIEW SYMPOSIUM - COERCION OR VOLUNTARISM: AN INTERNATIONAL CRITICAL REVIEW.

Jäger Hans,
AIDS Study Group, Schwabinger Krankenhaus, Munich, FRG.

Of the total of about 2 300 CDC AIDS cases in West Germany 17% have been diagnosed and treated in Bavaria, one of eleven West German states ("Länder"). During the first months of 1987 a package of anti-AIDS regulations ("Bayrischer Maßnahmenkatalog") was decided by the catholic conservative majority within the Bavarian state parliament. Since then Bavaria has had a political and legislative AIDS position that - more in theory than in its practical consequences - contrasted sharply with the other 10 German states, with federal policies, with WHO recommendations and in part with scientific knowledge.

HIV testing in foreigners from non EC countries as well as to civil servants and judges to be hired, coercive stage approval IVU and male and female prostitutes and a 98 % (voluntary) testing rate within prisons were introduced. Counseling, psychosocial treatment facilities and free anonymous testing in every private doctor's office were made available. No mandatory testing or reporting, no large scale screenings were organized. Several cases of criminal justice against HIV positive individuals rose concerns within human rights groups in Bavaria and abroad. Homosexual men and many patients from other risk groups were unnecessarily frightened. Growing mistrust in public health authorities was noted.

No major modes of AIDS prevention was observed. Because of high standard basic research and clinical care especially in Munich, some patients are coming from other states as well as other countries to get treatment here.

W.F.O.21

Sweden: A Review on compulsive treatment, Gunnar Ågren, County Council of Stockholm, Stockholm, Sweden.

Swedish HIV-positive patients can be submitted to compulsive treatment if they don't follow the chief medical officer in the county. This is in accord with the law on control of infectious diseases. The law is, however, very seldom used. In Stockholm a special hospital department with two beds is used for this purpose.

HIV-infected drug addicts are more often treated according to a special law which permits compulsory care of alcohol and drug abusers for a time period up to 6 months. There is a number of special institutions for this kind of treatment. A cohort of 133 compulsory treated drug addicts, 58 of them HIV-positive, has recently been followed up. The results are not encouraging.

W.F.O.22 ETHICAL AND LEGAL ISSUES OF AIDS IN SOUTH AFRICA.
Eichel, Gideon J.,
University of Cape Town, South Africa.

Objective. To analyse existing laws and effects on preventive, educational and health care programmes within an ethical framework.

Methods. Amongst others the Health Act, Sexual Offences Act, Admission of Persons to the Republic of South Africa Act, Media Act, the Medical, Dental and Supplementary Health Services Professions Act were analyzed.

Results. The Sexual Offences Act have a potentially counterproductive effect on homosexual and prostitutes: regarding sexual contact with minors it has the inherent danger of a homophobic backlash and blackmail by male prostitutes over sixteen but under nineteen years of age. Listing AIDS and HIV infection as a communicable disease may dissuade persons with HIV infection of AIDS to seek medical help; it has the positive aspect of empowering the Medical Officers of a Local Authority to take action against a known infected person who persists with irresponsible behaviour. Declaring any foreign passport-holder with AIDS or HIV infection a prohibited person have potentially serious consequences for individuals. Existing health and education laws cause fragmentation of preventive, educational and health care programmes. The Medical, Dental and Supplementary Health Services Professions Act provide mechanisms for investigation of foreign passport-holders and HIV infection as communicable disease and Media Act for investigation of improper media reporting.

Conclusion. Homosexuality and prostitution should be decriminalized; regulations on foreign passport-holders and HIV infection as communicable disease should be reviewed; the identities of persons taking legal action against breach of confidentiality and media exposure should be protected.

W.F.O.23 A HUMAN RIGHTS PERSPECTIVE
Justice Michael Kirby, (Member, Global Commission AIDS), Sydney, Australia.

Law is traditionally bound to a particular territorial jurisdiction. It typically reflects local cultural norms and historical institutions. But AIDS/HIV is international in character. Its global dimension provides an international context for the measures of response. National, subnational and international responses must be considered in the light of the developing jurisprudence of human rights. Not only does this require consideration of local constitutional or other guarantees now typically found in the laws of most societies. It requires compliance with developing international human rights law. This includes law declared by the Universal Declaration of Human Rights and established by such international instruments as the International Covenant on Civil and Political Rights. One function of

WFO - and the Global Commission on AIDS - may be to remind member countries of the provisions of international law on human rights as it affects local responses to the epidemic. As the sorry history of past epidemics demonstrates, human rights are often the first casualties of a challenge such as AIDS.

The thesis of the author is that this time we should do better. Not only is compliance with human rights a legal obligation and a moral requirement. It is also likely to be the only effective way of securing the cooperation of persons and groups most affected by the epidemic.

Th.F.O.7 DISCRIMINATION REFLECTED IN THE LANGUAGE AND DIAGNOSES OF TARGET HIV CLIENT BY PHYSICIANS
 Notion, Sujet: Schwarzbauw, J. & Wham, J. "Memphis State University, Memphis, Tennessee, United States. "University of Tennessee, Memphis, Tennessee, United States.

The object of this research was to see whether the language of physicians varied with the type of diagnosis they would make for somebody who has been described as having the HIV virus. In addition to questions about how they talked about AIDS, each physician randomly received a one case study vignette. The only difference across vignettes was whether the patient was described as male or female, homosexual or heterosexual, or white or black. Six hundred physicians were randomly sampled.

It was found that physicians discriminated in terms of diagnosis across vignettes. Also, how they talked about AIDS reflected biases. The language of physicians often reflected ethical biases relating to the AIDS problem. For example, out of two hundred and thirty two metaphors reported by general physicians in answer to the question, "AIDS is like _____" some physicians responded with extremely judgmental replies: "AIDS is the wrath of God," "AIDS is the plague brought to us by a minority of aberrant individuals," and "AIDS is poetic justice, almost."

This information is being used to craft educational programs which sensitize physicians and residents to ethical issues inextricably related to AIDS issues.

Vue d'ensemble de la législation sur le SIDA Global Survey of AIDS Legislation

M.F.P.1 LEGAL PROTECTIONS AGAINST HIV-RELATED DISCRIMINATION IN THE USA: A FIFTY-STATE ANALYSIS

* National Gay Rights Advocates, San Francisco, California, USA

Objective. To determine extent to which U.S. state handicap discrimination laws prohibit HIV-related discrimination in employment, housing, public accommodations, and other areas.

Method. Survey of state human rights agencies in 50 states and Wash., D.C.

Results. Clear majority of state agencies interpret state handicap laws to prohibit discrimination against people with AIDS, AC, and asymptomatic HIV infection, although minority differ (see table below.) Majority also prohibit discrimination against uninfected persons considered "high risk." In addition to differences in statutory interpretation, other gaps exist in protection: 2 states have no handicap discrimination statutes; 3 state laws exclude "communicable diseases" from protection; 2 states prohibit only government discrimination. Although all state laws govern employment, only 38 cover public accommodations, 37 cover housing and 21 cover credit.

State Law Protects:	Yes	No	Unclear
Employment with AIDS	79	8	14
Persons with AC	69	9	24
Asymptomatic HIV persons	60	12	28
Uninfected persons considered "high risk"	55	18	27

Conclusion. Many people with HIV infection are unprotected from discrimination in the USA as a result of inconsistent state laws and policies. Nevertheless, consensus is developing that state handicap discrimination laws prohibit discrimination against people with AIDS, AC, HIV infection,

M.F.P.2 LEGAL AUTHORITY FOR HIV TESTING OF ADOLESCENTS

Keith Richard, Associate Professor, University of Maryland School of Law, Baltimore, Maryland, USA

Objective. To describe the risk of HIV infection in adolescents in the United States and to unravel the varied laws in each state to allow for the voluntary HIV testing and counseling of adolescents without parental consent or notice to parents.

Methods. Analysis of the statutes in each state concerning medical care for minors, venereal and sexually transmitted diseases, emancipation and HIV infection. Analysis of case and constitutional law and the law relating to parental rights.

Results. Evidence in a number of studies points to the potential for a new wave of infection among adolescents in some areas of the United States. Little attention has been devoted to the risk to adolescents in the U.S. and the new laws designed to contain the infection ignore the special problems of adolescents.

Conclusion. Legal authority exists in all jurisdictions in the U.S. for the voluntary testing and counseling of minors but the authority is usually not found in venereal or sexually transmissible disease statutes. The sources of authority differ from state to state and do the requirements of confidentiality and notice to the parents of minor patients. A chart describing the sources of authority and confidentiality requirements in each state is attached.

M.F.P.3 IMPACT OF THE SANITARY REGULATION ON HIV TRANSMISSION IN BLOOD DONATIONS IN GUADALAJARA, MEXICO.

Yolanda Lozano*, Teresa Mendez, S.L.; Jauregui-Nos, M.,* and Soto-Molina.

*Instituto de Patología Infecciosa y Experimental "Dr. Fco. Ruiz Sánchez" de la Universidad de Guadalajara, Guadalajara, Jalisco, Mexico.

In Mexico, since May 1986, the mandatory detection of antibodies anti HIV in blood and its derivatives for the use in humans was legislated, one year later the prohibition of blood trade took effect.

Objective. To compare the impact of the sanitary legislation to mandate screening for HIV antibodies in blood donations in Guadalajara, Mexico.

Methods. An alenary sample was taken from 3228 sera of donors of six public and private blood banks in Guadalajara, between June 1986 and June 1989; 4020 in the first year and 1208 after mandatory; in all the samples the presence of anti HIV antibodies was determined by the ELISA assay and positive ones were confirmed by indirect immunofluorescence and/or western blot.

Results. During the first year, the seroprevalence fluctuated between 2.01 and 30.15% depending on different factors, compared to the second year where the seroprevalence was 0.1%.

Conclusion. It is concluded that the mandatory detection of antibodies anti HIV and the prohibition of blood trade, have been effective factors in decreasing the incidence of HIV in blood donors in Guadalajara, Mexico.

M.F.P.5 CURRENT ISSUES IN DRUG REGULATION IN THE U.S.A.

Malik, Stephen G., Human Rights Campaign Fund, Washington, D.C., USA

Objective. To identify and analyze key issues raised by current proposals to reform the legal regulation in the United States of the sale of drugs for medical treatment.

Methods. The author is an attorney and lobbyist concerned with AIDS policy in the USA, has read a number of legislative and regulatory proposals, reviewed the literature, and attended conferences where these proposals have been discussed.

Results. Current proposals for legal reform of drug regulation have attained new urgency in the public debate as a result of the AIDS crisis. It has been proposed that medical drugs be "de-regulated" by eliminating the efficacy requirement, or the requirement of a doctor's prescription, and related rules of civil liability. It has been proposed that the governmental role of reviewing and certifying drug tests be either eliminated or made purely advisory. It is claimed that de-regulation will make effective drugs more widely available to patients and enhance individual choice. The strongest objection to this claim is that competitive processes will result in "bad" drugs driving "good" drugs out of the market.

Conclusion. Empiric research is needed to establish the benefits and costs of a legal requirement that medical drugs be proven effective before sale.

M.F.P.4 PHYSICIAN BREACH OF PATIENT CONFIDENTIALITY AMONG INDIVIDUALS WITH HIV INFECTION: A PRELIMINARY INVESTIGATION OF TENNESSEE, GEORGIA, AND MISSISSIPPI.

John Whelan*, Robert Novack**

*University of Tennessee, Memphis, Tennessee, USA, **Memphis State University, Memphis, Tennessee, USA

To determine whether the sex, race, or sexual preference of an HIV infected patient influences a physician's decision to breach patient confidentiality, 222 Tennessee primary care physicians were each mailed a questionnaire containing a case study in which an HIV infected patient presented a risk to a third party. Eight different descriptions of the sex, race, and sexual preference of the hypothetical patient were distributed equally among the physicians who were asked to decide whether to maintain confidentiality, notify the health department or inform the patient's partner. Physicians said they would report a black male homosexual to the health department 16.1 (17.50%) times more often than they said they would a black female homosexual. Physicians with increased knowledge of AIDS were 50.4 (28.0, 88.0) times more likely to say they would inform the partners of black homosexuals than those of black homosexuals. These physicians were also significantly more likely to report male homosexuals to the health department than they were female homosexuals. Physicians reporting confidence in their knowledge of AIDS also said they would report male homosexuals to the health department with greater frequency (odds ratio 59.2 (6.0, 581.0) than they would female homosexuals. These physicians were 6.6 (1.4, 50.8) times more likely to say they would inform the partners of black males than they would those of white males. When physicians decide to proceed a third party by breaching an HIV infected patient's confidentiality, they consider the race, sex, and sexual preference of the patient.

M.F.P.6 TRENDS IN AIDS LITIGATION IN THE UNITED STATES - 1983 TO 1989

Bartham, Sara W., and Reiland, V.E. Office of the General Counsel, Centers for Disease Control, Atlanta, Georgia, U.S.A.

Objective. To review published cases involving AIDS litigation to identify current legal issues.

Methods. Over 300 legal actions occurring in the past 6 years (1983 through 1989) were reviewed and categorized. Comparisons were made by category between the earlier cases (1983 to 1986) and the more recent cases (1987 to 1989).

Results. Within certain categories, litigation patterns established prior to 1987 have continued over the last two years, including a significant number of legal actions involving prison-related AIDS, employment discrimination, and sanctions against recalcitrant HIV transmitters. However, new patterns have also emerged since 1986, such as decisions involving appropriate use of the HIV test and decisions disclosing the names of blood donors to transfusion AIDS plaintiffs.

Conclusions. During the past 2 years the number of reported AIDS legal actions has more than doubled the total that were reported during the preceding 4 year interval of 1983-86. Within this rapidly expanding framework, a significant body of AIDS law is now taking shape.

Droit de éthique Ethics and Law

M.F.P.7 AIDS AND THE COURTS: COMPELLING AND PROTECTING THE DISCLOSURE OF AIDS STATUS
Morissette, Yves-Marie; de Glanville, H. Patrick; McGill Centre for Medicine, Ethics and Law, Montréal, Canada.

Court proceedings, whether civil or criminal, require under certain conditions the compulsory collection and the public disclosure of medical information. An AIDS patient may thus be forced to divulge his status in order to bring or to defend an action, including one not directly related to his illness. This paper discusses the competing legal policies which favour the confidentiality or the disclosure of a person's AIDS status in adversarial systems of procedure. Bearing in mind the desirability of protecting the privacy of AIDS patients, the authors examine (i) basic evidential principles, such as relevance, privilege and confidentiality, (ii) forms of compulsory discovery, including physical examinations and access to medical records, and (iii) the extent to which judicial proceedings and court records are and must remain open to the public. The idea of proportionality is central in this analysis. In most jurisdictions which adopt an adversarial model of procedure, legal rules already in existence allow for a satisfactory resolution of the conflict between the privacy of AIDS patients and the public nature of court proceedings.

M.F.P.9 SIDA : PROBLÈMES ÉTHIQUES POSÉS PAR LA PROTECTION DES DOSSIS DE SANG
D. BÉVÉRIER, CHAMBLÉ, M.P. LARSEN, J. CHAMBLÉ, P. ENEL, J.L. SAN MARCON

Laboratoire Santé Publique, Faculté de Médecine de Marseille, FRANCE

A partir d'une analyse qualitative concernant les aspects éthiques du SIDA, et portant sur 402 articles, notre réflexion s'est arrêtée sur problèmes particuliers posés au Centre de Transfusion Sanguine. Les questions ont été soulevées dès 1983, avec des mesures d'exclusion pour les donneurs présumés à risque; nous faisons une revue des législations des différents pays, en suivant leur évolution depuis l'apparition des tests de dépistage.

Toutes les questions éthiques posées par un dépistage systématique des donneurs sont analysées: anonymat, consentement éclairé, confidentialité ou ce qui concerne les résultats des tests, information des donneurs sur ces résultats... D'autre points concernent la responsabilité des banques de sang en cas de contamination. L'information des receveurs sur les dangers d'une transfusion dans des cas "à risque" ou des dons d'urgence ou de réserve.....

M.F.P.11 AIDS—ETHICAL, LEGAL, SOCIAL, AND ECONOMIC PROBLEMS

Joseph P. Izzo

New York City Council Health Committee Chairman
City Hall, New York, NY, U.S.A.

Objective. Examine the roles of ethical, health law, social and economic factors relating to the HIV epidemic.

Results. Discussion and analysis of the ethical, legal, social, and economic scope of this problem. Our failure to accurately predict the future size, magnitude, and changes in the pattern of the AIDS epidemic may result in the risk of total collapse of the health care system. Without a specific model to predict the future, we are placing our fiscal integrity in jeopardy for if we underestimate the size of the epidemic, we will guarantee that the result will be uncompensated care to all affected by the epidemic.

Conclusion. The establishment of a North American International AIDS HIV data base center would facilitate the collection, analysis, and distribution of HIV data which will encourage close collaborations between medical and epidemiologists and assist the governments of Canada and the United States in taking the most appropriate actions to stem the HIV epidemic.

M.F.P.8 THE CONSEQUENCE OF LEGALISATION OF PROSTITUTION IN VICTORIA
Overs, Cheryl*

* Prostitutes Collective of Victoria, AUSTRALIA

The objective is to explain and analyse the relationship between recent reforms to prostitution legislation in Victoria and changes to the structure of the sex industry with reference to HIV susceptibility of sex workers and clients.
Method. The following structural features of both the legal and illegal sectors of the sex industry will be discussed and compared: demography of participants; testing patterns; results and policy; industrial health and injury compensation; mechanisms for safe work practices and negotiation; policing; health care planning and other regulatory activity. **Conclusion.** Selective criminalisation and regulation of the sex industry may exacerbate the risks it aims to reduce where it simply reworks mistaken conceptual understandings of sex work from old criminal law into modern administrative provisions.

M.F.P.10 COMPELLING SEXUAL COOPERATION: DOES IT REMAIN OR SHOULD PUBLIC HEALTH
BENNETT, JUDITH, McGill Centre for Medicine, Ethics and Law, Montréal, Canada

Objective. To consider whether compulsory sex-reporting of HIV/AIDS facilitates the collection of necessary health and treatment, and the implementation of effective and safe sex practices.

Background. A number of empirical studies of compulsory requirements in public health legislation in Canada, the United States, and the United Kingdom have been conducted.

Results. (1) In the jurisdictions studied, which all have a similar pattern of HIV infection, HIV/AIDS cases have been reported more extensively in their respective countries under public health legislation. (2) This trend has been observed in the case of both men and women. (3) The extent of HIV/AIDS, (4) the way in which the provisions do not meet the specific requirements of public health measures) or too broad (the provisions are more restrictive of rights than is necessary for public health purposes). (5) There is often little or no statutory protection for the confidentiality of information reported.

Conclusions. (1) The lack of uniformity in compulsory requirements indicates uncertainty about the benefits and harms of sex-reporting in achieving the aim of reducing the spread of HIV and obtaining necessary epidemiological data.

(2) Compulsory sex-reporting can affect these aims and cause other harm by (a) discouraging necessary health and treatment, and (b) discouraging participation. One of the reasons why voluntary and non-remunerated sex-reporting may be better achieved by law.

(3) Some of the aims sought to be achieved by compulsory sex-reporting may be better achieved by other, less harmful, means. An empirical investigation of public health, concerning voluntary behavior changes.

(4) Support for individual rights demands that compulsory requirements be defined as narrowly as possible while still achieving the desired public health objective; the majority of requirements studied do not meet this test.

(5) There is an urgent need for HIV/AIDS sex-reporting requirements to be re-evaluated (a) to ensure collection of accurate and uniform data; (b) to protect individual rights to the greatest extent possible; and (c) to avoid obstructing and to maintain the effect of efforts to reduce the spread of HIV.

M.F.P.12 THE IMPACT OF LAW AND POLICY ON NEEDLE EXCHANGE PROGRAMMES IN CANADA
Orkin, A. and Gupta, A.S.

McGill Centre for Medicine, Ethics and Law, Montreal, Quebec, Canada

Objective. To evaluate policy and law as factors impeding public health initiatives aimed at preventing the spread of HIV amongst intravenous drug users in Canada.

Background. Analysis of Canadian policy and legislative approaches to illicit drug use and their impact on the distribution of needles and syringes to those at highest risk of HIV.

Results. The response to illicit drug use in Canada, mirrored and influenced by that of the U.S., is largely incoherent and inconsistent. Outside user legislation in 1988 as an intended result of anti-AIDS risks. Subsequent legislation was also followed by demands for stronger control of illicit drug markets which criminalisation had helped to create. Canadian narcotic legislation since 1981 imposes harsh penalties for possession, trafficking, importation and exportation, but mostly none for use. Treatment legislation has received little emphasis. The general climate is one of harsh societal disapproval of illicit drug use and drug users.

In contrast to the U.S. one Canada lacks legislation prohibiting the possession of needles and syringes or their supply to intravenous drug users. A recent Bill criminalising possession, sale and exportation of needles and syringes to intravenous drug users in Canada, only one pilot program has been established (1989). A conflict is perceived between the increased efforts for programs to prevent the spread of HIV and demands for tougher drug use laws. Increased efforts are required to persuade legislators and the public that these two goals are not incompatible, and that increased syringe distribution is not in contravention of the law.

Conclusions. The climate surrounding illicit drug use in Canada is a substantial obstacle to urgently-needed public health programmes to prevent the spread of HIV. Such programmes in Canada, only one pilot program has been established (1989). A conflict is perceived between the increased efforts for programs to prevent the spread of HIV and demands for tougher drug use laws. Increased efforts are required to persuade legislators and the public that these two goals are not incompatible, and that increased syringe distribution is not in contravention of the law.

STATE/LOCAL STRATEGIES TO PREVENT AND RESOLVE HIV-RELATED DISCRIMINATION: FIVE CASE STUDIES

Coauthors: Anne H.**, Sherwood-Faber, J.**, Steele, R.J.***, Karsten, S.L.***, Lorenz, S.T.***, Ritter, J.L.***, [†]Office of the Assistant Secretary for Health, U.S. Public Health Service, Washington, D.C., **Kirch and Davis Associates, Inc., Silver Spring, MD.

Objective: To identify successful processes for preventing and resolving complaints of HIV-related discrimination, and program features affecting replicability.

Methods: Five programs were selected for the study based on the existence of a relevant discrimination statute, availability of program documentation, and program experience. The project team visited all 5 sites (Los Angeles, CA; San Francisco, CA; New York City, NY; Philadelphia, PA; and, Olympia, WA), prepared case-study reports, and a final summary report.

Results: Litigation is rarely necessary to resolve complaints. Most often, discrimination occurs out of fear or ignorance, and interventions utilizing educational, mediation, and advocacy strategies are sufficient and timely. In addition, the programs' enforcement efforts appear to prevent some additional complaints. The programs may also provide technical assistance to persons seeking advice on their rights or obligations under the law.

Conclusion: The wide variety of site features suggests that the essential processes of these programs can be successfully adapted in many settings. Further, the programs' successes in keeping persons in their homes and/or jobs tends to promote private sector involvement in the AIDS issues, and may limit the burden of the AIDS epidemic which is shifted to the public sector.

La confidentialité et ses limites Confidentiality and Its Limits

T.F.P.1 TRIAL OF CHEMO-PROPHYLAXIS OF HIV INFECTION AMONG THE HEALTH-CARE WORKERS' RIGHT-TO-KNOW VISA-VIS THE PATIENT'S RIGHT TO CONFIDENTIALITY

Author: Stanley Korman, Hospital Center, Bronx, NY, USA.

Objective: To evaluate health-care worker's (HCW) rights vis-à-vis patients' rights in relation to possible chemo-prophylaxis of HIV infection in HCW after exposure in the workplace (WP) to HIV infective blood and body fluids (BBF).

Methods: The Burroughs Wellcome Co., makers of zidovudine (AZT), is sponsoring a double-blind, placebo-controlled trial of AZT in the prevention of HIV infection in HCW after WP exposure to BBF of HIV antibody (Ab) positive patients. Animal studies suggest that early AZT treatment is most effective. A rapid reliable slide test is now available to detect HIV Ab in serum.

Results: HCW may join the trial after exposure to known HIV Ab positive BBF by phoning 1-800-HIV-STIX. However, if the Ab status of the patient is unknown, informed consent, to protect patient confidentiality, must be obtained to test the patient's blood for HIV Ab. If consent is denied, and HIV Ab status of the patient is unknown, the HCW may be excluded from the trial.

Conclusion: After exposure of a HCW in the WP, patients who's HIV Ab status is unknown should be tested with the rapid slide test, with or without the patient's consent, since HCW right-to-know of a potentially lethal hazard in the WP and possible subsequent exclusion from the AZT trial supersedes the patient's desire for confidentiality of results of HIV Ab testing.

T.F.P.3 CONFIDENTIALITE ET SIDA. UTILISATION D'UN CODAGE IRREVERSIBLE DE L'IDENTITE

L. THILION, R. SARRUC, C. MANUEL, J.L. SAN MARCO

à Laboratoire de Santé Publique, Faculté de Médecine de Marseille, FRANCE

Objectif: Respecter la stricte anonymat des patients tout en permettant les soins épidémiologiques et économiques nécessaires par le SIDA.

Méthode: Utilisation d'un algorithme codé qui est le résultat d'une formule de calcul irréversible. Il est impossible à partir de ce code de retrouver l'identité du patient, son code. Pourtant la formule de codage est publique et un message suffit à décodifier.

Résultats: Validation de la non réversibilité du codage par le Service Central de la Sécurité des Systèmes d'Information.

Utilisation de ce message d'anonymat par les différents centres d'information de Santé (CISID), de même que par l'organisation responsable de la distribution des produits actifs contre le virus.

Conclusion: Cette méthode est opérationnelle et contribue à la protection de ces données médicales particulièrement confidentielles.

Éthique clinique Clinical Ethics

T.F.P.5 "PERCEPTIONS AND ATTITUDES OF HEALTH CARE WORKERS ON ETHICAL AND SOCIAL ASPECTS OF AIDS IN A DEVELOPING COUNTRY."

Faizal Farhat, B. A. A. Greatt. University of the West Indies

Monica, Kingpin AIDS has raised several controversial and unresolved ethical, social and medical health care problems.

In order to assess the perceptions and attitudes of Jamaican health care workers (HCW) on ethical and social aspects of AIDS, we conducted a survey in 4 Jamaican hospitals between July-August, 1986. 500 Questionnaires were sent to randomly selected members of which 379 were returned before the cut off date. A response rate of 75%. The affirmative responses (A) were tabulated for each category of HCW.

QUESTIONS	Doctors (n=102)	Nurses (n=112)	Hygiene (n=104)	Radiographers (n=102)	Total (n=420)
1. Confidentiality	20	8	9	11	23
2. Routine screening	78	78	55	63	51
3. Identity card	78	84	86	83	83
4. Special isolation hospital for AIDS patients	40	57	59	50	40
5. Sharing waiting room/toilet facilities	70	63	53	52	62
6. Extensive lab tests for seropositivity test	90	59	57	54	71

Our survey demonstrated that HCW do not differ in their perceptions and attitudes as compared with general public. Hence, HCW of developing countries need to be further educated themselves before they can educate the public.

T.F.P.2 CONFIDENTIALITY AND AIDS: A CANADIAN PERSPECTIVE MAGILLIAN, ROBERT M., Barnes, M.E.*

*Ministry of Health, Ontario, Canada

Objective: To explore legal, ethical and public health issues related to balancing the interests of the individual with respect to privacy of personal information, with that of protecting the health of the public.

Methods: The presentation will report the results of inter-provincial consultation and collaboration on such areas as: 1. control of HIV testing facilities; 2. reporting requirements; 3. collection of epidemiological data; 4. contact tracing and counselling; 5. under which circumstances should information be disclosed and to whom. Information will include the results of an invitational conference for providers, patients and the public on these same issues as well as the results of a formal inter-provincial working group.

Results: The consultation has resulted in national agreement on definitions, general principles for HIV testing, basic data to be collected for testing, the role of public health authorities and primary care physicians, and guidelines for the following: i. disclosure of information to protect the interests of the HIV positive persons; ii. disclosure to protect sexual or other contacts; iii. disclosure to protect the public; disclosure to protect patients of HIV positive physician and iv. disclosure to an employer

T.F.P.4 ETHICAL THEORIES APPLIED TO CONFIDENTIALITY IN HIV/AIDS DINA, J. Editor, Union Theological Seminary, New York, NY, U.S.A.

Objective: Protection of confidentiality and prevention of further disease through an

Method: Use of various established theories and models applied to the problems of the prevention and limitation of confidentiality for infectious immunodeficiency Syndrome (AIDS), AIDS Related Complex (ARC), or Human Immunodeficiency Virus (HIV), and the theories and models to the conflict between the medical tradition of absolute confidentiality between clinician and patient and the tradition of disclosing infectious status to others at risk of the presenting patient, allowing these others to make autonomous choices.

This debate, while important for patients who are openly homosexual or intravenous drug abusers, is even more key for the bisexual male, often married, and with children or planning children, whose bisexual preference is not known to his family.

For medical practitioners and the students who work with them, the dilemma is unavoidable. Often these patients belong to a family practice organization. Hence, their wives and other family members of the same group of practitioners, balancing the value of confidentiality for the presenting patient against the value of protecting the health of the other persons also known to the practitioners. Yet, it is a physician or group inform their other patients, will the presenting patients disagree, thereby leaving any choice of their clinicians unhelpful and affecting their behavior?

The paper will include a sample protocol that attempts to apply ethical theories to these problems.

Results: With sustained counseling, most infected patients will voluntarily inform their contacts where they have not done so. Where physicians have done so, these patients have generally not been lost to treatment. There have been some notable and unfortunate exceptions.

Conclusion: Under certain circumstances, it is ethically permissible to break confidentiality, when the direct and immediate result is the probable prevention of disease, and there are no other means to accomplish this goal.

T.F.P.6 A MODEL FOR FACILITATING PHYSICIANS WITH AIDS OF RISK WHEN TREATING PATIENTS WITH AIDS

Franklin, Victor Y., Walker, J., Blake, P.,

San Jose Medical Center, San Jose, CA, U.S.A.

The refusal of physicians to treat patients with AIDS because of fear of infection is a recognized problem. Recently clinicians have proposed models based on strain to encourage physicians to treat patients with AIDS. It is argued that these models will not be widely enough applied and the additional model that recognizes physician self-interests are needed.

Physicians have always shown a mixture of altruism and self-interest, the proportions varying not only from individual to individual, but from one historical era to another. The period when all apparently quackish physicians treated the contagious, it is assumed that is generally held today, based only a century (c. 1800-1900). This was also a period when a high degree of paternalism was inherent in the physician's role and it is argued that the benefits of paternalism, e.g. power, self-interest, and submission, compensate in part for the risk of infection.

Public culture and self-interest are recognized and derive self-interest because they risk their lives daily in the service of others. When a public officer or fire-fighter is injured or dies in the line of duty, he or she is considered a "hero" because the injury or death resulted from the willingness to assume the risks of the job. Being interested and being seen by others as heroes might provide additional justification to some physicians to help compensate for the risk of infection. The first step in helping physicians become a selfless, respectful, emotional and financial, for someone who accompanies in the line of duty. Specific proposals to implement such a model and implications for other health-care workers will be presented.

T.F.P.7 **CHRL BIOCETHICS COMMITTEE AND THE ANTI-HIV SCREENING TEST**
Mauritice R. E. *
*Centre Hospitalier de l'Université Laval (CHUL), Québec (QC), Canada; *Chûpital de biotechnique.

Within 16 months, three requests for opinion concerning the use of anti-HIV screening tests were submitted to the CHUL Bioethics Committee by health-care professionals. The first request dealt with accidental infection with HIV among the surgical block staff (1988-91). The second request dealt with routine screening of anti-HIV for all patients undergoing surgery (1989-91). The third request was related to the management of fresh semen in frozen semen stocks for the purpose of heterologous insemination (1988-91).

Objectives: To present: (a) the positions adopted by the Committee; (b) the scientific, legal and ethical considerations that justified these positions; (c) the outcome of these requests for opinion submitted to the Committee.

Method: The method adopted by the Bioethics Committee is as follows: (a) creation of a multidisciplinary task force (medicine, ethics and law) upon reception of the request for opinion; (b) submission of a preliminary paper to the Committee; (c) discussion of and modification to the preliminary paper by the Committee; (d) issue of a unanimous opinion by the Committee.

Results: These opinions are now part of CHUL internal policies regarding the use of the anti-HIV screening test.

Conclusions: 1. The fear of possible accidental contamination by HIV among health-care professionals is very high. 2. Health-care professionals are aware of the ethical dimension in the use of the anti-HIV screening test.

T.F.P.9 **ETHICAL STANDARDS IN THE CONTEXT OF HIV INFECTION**
Nobert Bouché, Ian Schäfer, Deutsche AIDS-Hilfe e.V.
Neustadt, B-9, 1000 Berlin 11, West-Germany

Objective: To determine ethical standards for obtaining medical data.
Methods: The Deutsche AIDS-Hilfe performed several seminars on ethical standards. Participants were people with HIV and AIDS, doctors, health care workers, philosophers etc.

Results: It was found that there is a lack of ethical standards in treatment, counselling and research with people with HIV and AIDS. An ongoing irrational fear of contracting HIV and AIDS is one of the main factors that inhibit people from dealing with HIV infection and AIDS in an objective way. The lack of ethical standards in collecting medical data leads to the misgiving of people with HIV and AIDS that their personal data could be misused and that treatment research is more for the benefit of the researcher and not for the person with HIV and AIDS. **Conclusions:** There is a desperate need for national and international ethical standards for counselling and research. Specific proposals will be presented at the conference.

T.F.P.11 **APPROCHÉ ÉTHIQUE EN PRÉSENCE D'UNE SEVE HÉMOGRAPHIQUE**
MABEL GAGLIARDI, EMIL P.A., DANIEL J.P., REYNER D., LARSEN R.P.,
DAN SIEGEL
*Laboratoire de Saint Pauliens, Faculté de Médecine, Montréal, FRANCE

Objectif et méthode: L'étude hémigraphique présentée a débuté par l'introduction de quatre bandes de bandelettes médiales, CHRL, Biotek et HEM, avec les kits d'analyse (assemblée au no 105) à l'échelle, Droits, Droits de l'homme, Confidentialité, Législation, Jurisprudence. Un total de 412 références ont été listées de 1982 à fin 1987.

Méthode: Après lecture et analyse des publications disponibles et à l'aide de certains (1987), les législations québécoises, CHRL, Biotek et HEM, avec les kits d'analyse recueillies dans les articles ont été répertoriées par thèmes et classées.

La classification qui sera présentée est la suivante:

- 1 - BÉNÉFICES DESTINÉS À PROTÉGER LA SOCIÉTÉ
Nouveaux produits et méthodes d'analyse et traitement, services d'assistance sociale, services groupés, tests de sérologie, application de code criminel, déclarations obligatoires à l'Agence, protection des dons de sang, vaccins et médicaments nouveaux, essais thérapeutiques, information, éducation.
- 2 - BÉNÉFICES DESTINÉS À PROTÉGER L'INDIVIDU
Droits fondamentaux de l'individu : droit à la confidentialité, à l'information et au silence.
Droits citoyens : liberté, droit à l'éducation, au travail, etc...
Droits de l'individu non malade : droits de contacts, sécurité du personnel soignant, des receveurs de sang, etc.

T.F.P.8 **A LEGAL OR ETHICAL DUTY TO WARN: ONE LAST TIME**
North, Richard, Rothenberg, K. Associate
Professor, University of Maryland School of Law,
Baltimore, Maryland, USA.

Objective: To reconcile the moral, institutional, public health and legal principals bearing upon the existence of a duty owed by professionals to warn unsuspecting third parties that a patient or client knowingly places that third party at risk of HIV infection.

Method: Reviewed the medical, ethical, and legal literature concerning the "duty to warn" and summarized the arguments. Evaluated the many proposals for legislation or for legal clarification of the moral dilemma.

Analysis: There are three primary values or goals competing in the debate: confidentiality, the public desire to block the spread of infection and the personal desire to avoid legal liability. These values are irreconcilable in some extraordinary factual circumstances. Law does not resolve these tensions nor should it be relied upon to do so.

Conclusions: Professionals are traditionally entrusted by society to make difficult decisions, distinguishing them from other occupations. On a case-by-case basis, professionals must determine if a warning (or other action) to a person at risk of infection is the highest "good." We propose a framework for making that decision which includes consideration of a professional's risk of legal liability.

T.F.P.10 **SIDA : LES DROITS DES MALADES**
CHRISTEL JOLIVET*, LARSEN R.P.P., EMIL P.A., MABEL G., DAN SIEGEL J.L.*
*Laboratoire de Saint Pauliens, Faculté de Médecine, Montréal, FRANCE

Les relations de santé et de risque associées par le SIDA compromettent au danger éthique par le risque en matière de droits de malade au regard de la relation médecin-patient. **Objectif:** L'information et les soins.

Les défenseurs de la confidentialité protestent et défilent dans l'urgence sans une présentation de la transmission, tout en respectant la dignité des malades.

Les appaats traitent que le niveau de secret médical est le seul moyen de protéger le patient des contacts et pallier l'irresponsabilité de la plupart de ces malades.

Au sujet de droit de malade à l'information, les soins s'appuient sur quatre points principaux: l'accord de sujet par la pratique de test de dépistage, la réalisation de son affecter au malade, l'existence de consentement aux traitements et les modalités d'application des essais thérapeutiques dans le cadre de SIDA.

Quant au droit au soin, il se présente en deux cas: le SIDA, à tel point que les Assemblées Médicales sont sous contraintes de respecter fondamentalement ce principe d'éthique.

Un dialogue de santé s'est ouvert instauré entre défenseurs et détracteurs des droits de malade, entraînant parfois des prises de position excessives.
En fin des années le monde connait ce qu'est à apprendre à vivre avec le SIDA, et les problèmes peuvent être abordés de façon plus constructive.

T.F.P.12 **INFLUENCE OF HIV STATUS ON DECISION MAKING FOR SURVIVAL**
PODREK, DANIELA B. *
*Columbia University School of Nursing, New York, New York, U.S.A.
*Yale University School of Nursing, New Haven, Connecticut, New York, U.S.A.
*Brooklyn College, BROOKLYN, New York, U.S.A.

Objective: To describe the impact of maternal/infant HIV seropositivity on decision making for newborns.

It is clear that current HIV testing in the newborn does not yield results that allow for differentiation between maternal and fetal seropositivity. Newborn HIV status, however, is used by some physicians and nurses to justify treatment/management decisions. It is not always clear that alteration of the management plan based on HIV status is warranted. In addition, parents and parental surrogates (ie foster parents) may alter their decisions based on the HIV status.

Methods: Questionnaires administered to physicians and nurses in three metropolitan New York City neonatal ICUs and interviews with social service child-care workers.

Results/Conclusions: Preliminary data (both formal and anecdotal) indicate a newborn's HIV status influences decision making.

Th.F.P.1 AIDS AND ETHICS

Levi, Guido Carlos* & Barroo, Antonio Osério
Lima, A. *
* Hospital do Servidor Público Estadual, São Paulo, Brazil
** Health State Secretary, São Paulo, Brazil

Objective: The authors prepared for the São Paulo Medical Council and the Brazilian Federal Medical Council a resolution regarding many ethical aspects on AIDS. Approved in 1989, it is now the official guideline for Brazilian medical doctors on this matter.

Methods: The subject was divided into six parts: introduction, AIDS and discrimination, relationship between doctors and patients (including patient refusal, respect towards the patient, patient's abandon and confidentiality), AIDS and institutions (including hospitals, blood banks and prisons), AIDS and Occupational Medicine and AIDS and medical research.

Results: A short resume of each of these topics will be presented.

Th.F.P.3 STATE/LOCAL STRATEGIES TO PREVENT AND RESOLVE HIV-RELATED DISCRIMINATION: FIVE CASE STUDIES

Griffin, James H., Starwood-Petrie, L., Siseal, E.J.,**
Kavran, S.E.,** Lorenz, B.W.,** Miller, J.L.,**
Secretary for Health Services, Ontario, Canada
**Aitch and Davis Associates, Inc., Silver Spring, Md. U.S.A.

Objective: To identify successful programs for preventing and resolving complaints of HIV-related discrimination, and program features affecting replicability.

Methods: Five programs were selected for the study based on the existence of a relevant discrimination statute, availability of program documentation, and program experience. The project team visited all 5 sites (Los Angeles, CA; San Francisco, CA; New York City, NY; Philadelphia, PA; and Olympia, WA) prepared case-study reports, and a final summary report.

Results: Litigation is rarely necessary to resolve complaints. Most often, discrimination occurs out of fear or ignorance, and interventions utilizing educational, mediation, and advocacy strategies are sufficient and timely. In addition, the programs' enforcement efforts appear to prevent some additional complaints. The programs may also provide technical assistance to persons seeking advice on their rights or obligations under the law. **Conclusion:** The wide variety of site features suggests that the essential processes of these programs can be successfully adopted in many settings. Further, the programs' successes in keeping persons in their homes and/or jobs tends to promote private sector involvement in the AIDS issue, and may limit the burden of the AIDS epidemic which is shifted to the public sector.

Th.F.P.5 GOVERNMENTS' DUTY TO PROVIDE FINANCIAL ASSISTANCE AND COMPENSATION TO PERSONS WHO HAVE CONTRACTED AIDS INFECTION BY HIV THROUGH BLOOD TRANSFUSIONS AND BLOOD PRODUCTS

Jacques J.M. BODIN, Hennes & Inattlie Law Firm, Montreal, Que.CANADA

Objective: 1) To review Governments' response to the Demands FOR COMPENSATION by individuals who have contracted AIDS INFECTION BY HIV THROUGH BLOOD TRANSFUSIONS AND BLOOD PRODUCTS.

Method: In addition to a brief review of the early history of ETHICAL and LEGAL issues, Reference is made to other countries legal principles and domestic constitutional documents are made to support arguments. Compensation schemes in other countries and their legal bases are also identified. **Results:** The author explains that since certain Governments had not characterized infection too broadly at the outset to those individuals who contracted the disease from contaminated blood. **Conclusion:** Those Governments displayed little interest in the duty of blood supplies in its system or ignored the early demand since it considered the most elementary responsibility in the field of human rights: the right to life and the protection thereof. Such Governments have the duty to compensate hemophiliacs and blood transfusion recipients infected by HIV/AIDS.

Th.F.P.2 L'ETHIQUE DANS LES GROUPES COMMUNAUTAIRES

Sourdis, Isabelle
Centre AIDS Montreal, Montreal, Québec, Canada

Objectif: Décrire l'organisation d'un groupe de travail sur les aspects éthiques dans un organisme communautaire. Les priorités, les méthodes, l'étude des besoins, l'identification des problèmes d'ordre éthique pour un groupe de travail sur l'éthique. Quelles priorités établir? Actions à entreprendre? Objectifs? Qui doit faire partie de ce groupe? Critères? Structure? Fonctionnement?
Méthodes: Elaboration de procédures d'acceptation des projets de recherche. Codes d'éthique interne. Code d'éthique des professionnels et des bénévoles. Positions officielles de l'organisme. Confidentialité.
Conclusion: Possibilité de ce genre de travail pour protéger les droits des personnes affectées par le virus. Voir au respect des individus (personnes atteintes, bénévoles, professionnels). Capacité de regarder objectivement un problème. Travail-réflexion.

Th.F.P.4 EQUALITY RIGHTS FOR PEOPLE WITH AIDS: MANDATORY REPORTING OF HIV INFECTION AND CONTACT TRACING IN ONTARIO

Fleming, William F., B.A., LL.B. (Toronto), D.C. (Paris 1), LL.M. (Columbia); Columbia University School of Law, New York, New York, U.S.A.

Objective: To examine the public health rationale and constitutional implications of (1) the mandatory reporting of HIV infection with identifiers and (2) an active contact tracing program supervised by public health officials (as in the present practice in the Province of Ontario).

Method: Examination of the equality rights provision under s.15 of the Canadian Charter. I present the view that protection for the physically disabled under s.15 extends to HIV-infected individuals. I then examine whether the Ontario program, which prejudicially affects the interests of the physically disabled, can withstand Charter review. **Conclusion:** Because of concerns for confidentiality, the mandatory reporting of HIV infection with identifiers seriously discourages voluntary HIV testing, an essential element in preventing the spread of HIV. Mandatory reporting does not therefore serve the public health objective of controlling HIV. Although mandatory reporting does permit public health officials to enforce a contact tracing program, contact tracing is better performed by private physicians (where warranted) rather than public health officials. Physician-conducted contact tracing (even without the patient's consent) less seriously threatens the need for confidentiality because no state records of HIV infected individuals are maintained. Third parties at risk for HIV infection are thus notified without seriously discouraging individuals from seeking voluntary HIV-tests.

Th.F.P.6 PROVIDING HIGH QUALITY, LOW COST LEGAL SERVICES TO PEOPLE WITH AIDS: A DISCRIMINATION LAW PROJECT

Barnes, Mark and Greenberg, J.
AIDS Law Clinic, Columbia University School of Law, New York, New York, USA

People with AIDS or HIV infection, as well as persons only perceived to have AIDS or HIV infection, have experienced severe discrimination in employment, housing, access to health care and insurance. At the same time, because of indifference or fear-inducement due to medical expenses, persons with AIDS have had very limited access to high quality legal help for their discrimination problems. In September 1988, the Columbia University School of Law formed an AIDS Law Clinic, staffed by two full-time faculty and sixteen students, each of whom devoted half their academic time to the Clinic and received one-half of a semester's course credit for their work. Operating under a special practice order from the local court system that allowed the students to function as formal legal representatives, the Clinic accepted referrals from local AIDS service organizations, local human rights agencies and public interest attorneys. The Clinic provided free legal services to its clients, and by February 1989, it had accepted representation in approximately thirty discrimination cases, with several cases already resolved in favor of clients who otherwise would have lacked any private legal counsel. By using law students as legal representatives, the Clinic has provided high quality, low cost legal services to underserved populations. Also, law students valuable experience in the representation of clients and training in important policy issues. The AIDS Law Clinic can serve as a model for similar clinics at other professional schools.

Droit et éthique Ethics and Law

Th.F.P.7 AIDS POLICIES OF CANADIAN UNIVERSITIES

Harvey, Donald C.,¹ Blomhette, M.²

¹Canadian Association of University Teachers, Ottawa, Canada.
²Canadian Association of University Teachers, Ottawa, Canada.

Objective: A study of the administrative and ethical policies on AIDS of Canadian universities in regard to their faculty, students and support staff.

Method: by questionnaire and telephone follow-up with university administrators and the local representatives of faculty, students and support staff.

Results: Universities normally regard themselves as leaders in their communities. This research tests whether Canadian universities are acting as leaders in this area. It examines and analyzes on a comparative basis the extent to which Canadian universities have developed policies both to deal with AIDS on the university campus and to educate the university community about AIDS. This involves in the first category such ethical and administrative matters as policies on confidentiality, restriction of access to some or all university facilities and programs, access to insurance programs and the second category the type of program for educating staff and students and the investment therein.

Th.F.P.9 HIV ANT-BODY TESTING: is consent the legal issue?

Harvey, Don, Leah Officer, The Terrence Higgins Trust Legal Centre, U.K.

Objective: To analyze the legal importance of patient consent, and to ask whether it secures the proper use of the antibody test.

Method: Consent is important ethically and professionally. Testing without consent would undermine confidence in public health. Whereas voluntary testing is extremely useful. Positive or negative people can be advised to have safer sex directly by the doctor or clinic. Consent is required under UK law before a patient's blood is tested. Without expressed or implied consent there is no defence to the charge of assault. People tested positively without consent can sue, if, as a result, they lose their insurance, job or accommodation.

Conclusion: Consent is an important legal issue in ensuring the proper administration of the antibody test. How the test is used may be the more important social and legal issue. Agreeing to have a HIV is fast becoming a standard pre-condition to be considered for insurance, a job or work permits in some countries.

This requirement is legal in the UK, should it be?

Th.F.P.11 CATASTROPHIC RIGHTS

Olson, John Frederick, B.C. Civil Liberties Association, Vancouver, British Columbia, Canada

Objective: To define and explore the limits of a special instance of patients' rights in the context of catastrophic illness.

Method: To bring the disciplinary tools of philosophy and law to bear on the task of analyzing the conflicting claims of the catastrophically ill and public health authorities in connection with the specific issue of access to experimental therapies, and the general issue of therapeutic self-determination.

Result: Considerable merit is discovered in the argument of public health policy-makers that important public interests are served by the social control of therapies. In opposition to this result it is discovered that there exists a well-grounded claim, on the part of the catastrophically ill, to an enhanced right to therapeutic self-determination. Specifically, a symmetry between the right to refuse medical treatment (one of the most well-established rights of patients) and the right of the catastrophically ill to access experimental therapies is discovered and explored. When catastrophic rights are carefully balanced against the public interest sought through the governmental control of therapies, it is discovered that they are real, not limited scope.

Conclusion: Regulatory authorities should respond to catastrophic rights by carefully liberalizing access to some experimental therapies.

Th.F.P.8

FORUM FOR CIVIL AND HUMAN RIGHTS SOCIETIES ACTIVE IN AIDS WORK
The B.C. Civil Liberties Association
B.C., CANADA

Objective: To make possible a sharing of information and expertise in the specific areas of concern to governmental and non-governmental bodies concerned with the recognition and protection of individual rights in connection with AIDS.

Methods: To inform most of the human and civil rights bodies in the world - including all ambassadors of every government - of the special focus of the 1989 International Conference on both social and scientific issues, and to encourage their participation in a special forum for rights bodies. The physical planning for such a forum can be organized on the basis of the responses received to the correspondence with these bodies undertaken by the B.C. Civil Liberties Association.

Conclusion: We suspect that many rights bodies would welcome an opportunity to explore together, in the supportive expert context provided by the International Conference, the special difficulties posed for individual rights by AIDS. Regulatory authorities would capitalize on an opportunity to sensitize rights advocates to the substantial public interests that policy makers must responsibly secure as they respond to the special plight of the AIDS person.

Conclusion: The Rights Forum, organized under the aegis of the International Conference, is an important step towards reconciliation of the perspectives of AIDS persons, their advocates, and the governmental authorities who must adjudge their demands.

Th.F.P.10 A BILL OF RIGHTS FOR PERSONS WITH AIDS

Spitzer, Herbert S., Ph.D., Taylor, Clark¹
¹Issues Committee, ACT UP, N.Y., U.S.A.

The objective of this abstract is to describe the elaborating of a Bill of Rights for Persons living with AIDS. Above all else, the medical, political and social rights of Persons with AIDS must be secured in the treatment of this disease. To ensure this objective, a Bill of Rights for PWAs must be drafted, discussed, ratified and promulgated. It will be developed primarily by Persons with AIDS, defined as anyone who is HIV seropositive and/or living with AIDS or ARC. This Bill of Rights will serve as a model to be presented to national legislative bodies, and to the United Nations General Assembly and the World Health Organization; it will contain recommendations for laws that will place the health and care of PWAs in the forefront of setting national and world policies on AIDS. Medical, moral, economic, political and social principles affecting all aspects of AIDS (including but not limited to research, treatment, health care and public policy) will be derived from what is beneficial for persons most effected by AIDS--those having the disease. Any and all claims, be they political, medical, economic, scientific, proprietary or social, conflicting with the principles in the Bill of Rights will be subordinated to the fundamental rights of Persons with AIDS.

Th.F.P.12 THE INFLUENCE OF AIDS ON INDIVIDUAL RIGHTS AND THE DIGNITY OF PEOPLE

Arredondo, C., Conde, F., Coronado, A., Gil, E.,
Ministry of Health, Spain.

Objective: The influence that AIDS is having on the rights of individuals and the dignity of people in the social conception of it is, and the form in which different social groups learn about it has been studied. This has taken account the fact that the repercussions of AIDS go far beyond daily social affairs, and that within society it is reflected as a contagious-incurable-sole-mortal-fact that causes the inevitable physical deterioration and ensuing death, as well as inevitable social segregation.

Conclusion: This report presents research carried out by means of a representative survey of the Spanish population and has clearly shown that information and rational reasoning alone when dealing with AIDS are insufficient to undertake this problem which is strongly rooted in deeper "social fears".

M.6.0.1 EVALUATION OF THE PROGRAM FOR PREVENTION AND CONTROL OF BLOOD TRANSMISSION OF HIV (PCPCT) IN MEXICO
Basilla, L., Garcia, L., Dominguez, A., Valdesola, M.,
 "Instituto de Epidemiología y Higiene de Salud, Mexico,"
 "National Center of Blood Transfusion."

Objective: Evaluation of the Program for Prevention and Control of Blood Transmission of HIV (PCPCT) in Mexico.
Method: To design a strategy for the evaluation of donors, blood products and recipients, to measure the impact at short, medium and long term of PCPCT.

Results: The PCPCT in Mexico has been functioning for two years. Infrastructure, legal modifications and political will were required. The initial legal modifications based on an acceptance of 7% of paid donors, were mandatory donation of donors and prohibition of blood commerce. A national network of laboratories (NNL) was created. At present, seroprevalence in donors is 0.01 to 0.08%. 700,000 units of blood are transfused yearly. Main coverage problems are located in rural areas and small hospitals in other areas. Measures taken to face this problem include the adoption of quick tests and the expansion of the NNL. Cases associated to transfusion increase from 2.2% in March, 87 to 11.2% in January, 88.

Conclusions: In those countries where the transmission of HIV associated to transfusion of blood products is important, it constitutes a bridge between hematological and general transfusion. Measures to ensure the quality of blood should be screened, including the prohibition of blood commercialization. The medium term evaluation shows that the measures adopted are still insufficient. It is expected that cases associated to transfusion continue to increase for some years. The adoption of quick techniques and consolidated purchases of reagents will allow the optimization of resources.

M.6.0.3 DETERMINATION OF HIV-1 SEROPREVALENCE IN A COHORT OF 800 INDIVIDUALS IN KINSHASA ZAIRE USING POOLED SERA CONCERNED WITH TESTING OF INDIVIDUAL SERA
Recht, L., Kasi, M., Ndilo, M., Brown, C., Ryser, R.,
 Quinn, T.C., "Projet SIDA, Kinshasa, Zaire," "HIAID, NIH, Bethesda, Maryland."

Objective: To determine the accuracy and cost-effectiveness of testing pooled sera samples compared to testing individual sera samples in establishing seroprevalence of HIV-1 infection in an African population.
Method: Serum samples from 800 persons were tested by ELISA (Orgenon) and repeatedly sensitive samples were analyzed by Western blot (DuPont). 800 pooled sera were made from this population, each containing 100 microliters from 10 different individuals. Pooled samples which were repeatedly tested by ELISA were considered positive.

Results: The seroprevalence as determined by testing 800 individual sera was 2.44% compared to 2.41% (95% CI=2.05 - 2.77%) as determined by testing 800 pooled samples. Of the pooled samples that tested negative (n=27), none contained any positive individual samples. Of the positive pooled samples (n=73), 146 contained 1 positive sample, 16 contained 2 positive samples, 2 contained 3 positive samples and 9 had 4 individual samples. 828 ELISA tests were required to determine seroprevalence using individual sera compared to 973 ELISA tests using pooled sera. To identify each individual positive sample within each positive pool, a total of 2996 tests would be required.

Conclusions: For determination of HIV-1 seroprevalence rates in large population-based surveys, testing of pooled samples appears to be cost-effective, practical and highly accurate.

M.6.0.5 THE USE OF DILUTION TECHNIQUES IN SCREENING FOR HIV-1 AND 2 ANTIBODIES IN WEST AFRICA
Bogdan, A., Njiru, N., Mwanah, C., Okian, B.,**
 Cham, M.,*** and Tedder, R.,****
 *Royal Victoria Hospital, Banjul, The Gambia, **Epidemiology and
 Statistic Unit, Banjul, The Gambia, ***Medical and Health Dept,
 Banjul, The Gambia, ****Middlesex Hospital, London, UK.

Objective: To demonstrate the potential usefulness of a dilution technique in HIV-1 screening in West Africa.

Method: Using a combination of 2 'screening' tests (either an ELISA and a particle agglutination test for HIV-1 or 2 different ELISAs for HIV-1 and Western Blotting), tested sera were categorized as either true HIV positives or HIV false positives. These sera were then diluted with HIV negative serum to 1/200 and retested using competitive ELISAs for HIV-1 and 2.

Results: 58 sera considered HIV positive were tested at dilution 1/200; 51 HIV-1 and 55 remained strongly positive. 59 sera considered to be HIV false positives were tested at dilution 1/400; 55 HIV-1 and all were found to be negative.

Conclusion: In areas where false positive HIV tests are a problem and where financial and technical resources may be limited, retesting diluted ELISA positive sera at dilution may give a reliable indicator of true HIV positivity.

M.6.0.2 A regional perspective of HIV antibody testing in the Americas
M. D. O'Donoghue, J. Finlay, A. Melzer, R. St-John,
F. Scazzari, M. Riccio

Federal Centre for AIDS, Health & Welfare Canada, Ottawa, Ontario, Canada
 The Federal Centre for AIDS, Health and Welfare Canada, and the Pan American Health Organization co-sponsored the first international meeting of directors of national AIDS reference laboratories, Americas Region.

The meeting, intended to assist countries in developing and strengthening the operational and scientific aspects of national HIV screening programs, was held in Toronto, Quebec, in August 1988 and was attended by representatives from 18 countries in the Americas. The meeting was preceded by four workshops at which small groups drafted position papers on: quality assurance, regional seroprevalence, standardization of the immunoblot and indirect immunofluorescence tests and laboratory networks. The papers were considered by the group as a whole, and consensus was achieved around the 4 topic areas.

The Laboratory needs, practices and human resource requirements were assessed by questionnaire. The analyses indicate resource allocation, laboratory facilities, scientific expertise and testing protocols are highly variable within the region. Infrastructure analysis and the resulting adoption of an appropriate network could lead to improved service with a minimum of expenditure within any given country. Development and implementation of a model laboratory network is in progress.

M.6.0.4 A Simple, Rapid, Practical HIV Screening Assay for Developing Country Manufacturing and Use.
Developing COUNTRY MANUFACTURE AND USE.
Herrick, M., Coulter, R., Schaffner, Barbara A.,
Spielberg, F., and Tan, M.R. Program for Appropriate Technology in Health, Seattle, Washington, USA.

Objective: To develop a simple, rapid, inexpensive HIV assay, which can be produced in and used by developing countries. Goals for such a test include a relatively short assay time, reagent stability, equipment independence, and an easily interpretable endpoint.
Method: HIV p24 peptide was immobilized onto polystyrene strips, and incubated with neat sera or whole blood. After a wash step, any bound antibody was detected by exposure to protein A-colloidal gold. The total assay time was less than twenty minutes.

Results: Preliminary data was generated using a panel of 110 specimens. The rapid test was positive on 34/54 Western blot-confirmed HIV sera (sensitivity 100%), but detected only 1/77 normal and 8/87 sera (specificity 98.7%). A positive result could easily be interpreted by a dark red dot of color on the plastic strip. Although the numbers of specimens at present are small, the test method is also accurate when assayed on samples of whole blood. A cost analysis indicated that the expense of materials is very low (less than US \$0.10 per assay).

Conclusions: We have developed an HIV screening assay which appears to be accurate, affordable, and practical. Transfer of this technology for the manufacturing of assay kits in areas proximal to their use will allow many developing countries to extend their screening capability to transfusion centers, primary health care centers, or other areas of urgent need.

M.6.0.6 POOLING OF SERA TO REDUCE COSTS OF HIV-ANTIBODY SCREENING IN BLOOD BANK DONORS FROM BOGOTÁ, COLOMBIA, SOUTH AFRICA
Boshall, J., Jorgé, García Marcela,** Carrero S.,
 Pérez, H.,** and Gaudin M.,**

(*) Instituto Nacional de Salud, Avenida Eldorado Carrero 50, Bogotá, Col.
 (**Red Cross National Bank, Bogotá, Colombia.

Objective: Because Colombia is a country with a relatively low prevalence of HIV antibodies among blood donors, (0.008%) we sought to determine whether donated blood samples could be pooled and then tested in a simple assay without a loss of sensitivity.

Method: A single pool consisting of five serum samples was assayed using six different commercially available antibody kits. One HIV-1 positive specimen taken from a group of self-made serum samples with different graded above seroconversion ELISA reactivities was included in each pool.

Results: We report on our findings using pools of five specimens and compare them with those from individual specimen screening. We assayed 196 pools of 980 serum samples. From 15 to 30% of pools containing low absorbance values positive specimens were missed.

Conclusion: We discourage the pooling of samples by this procedure in order to reduce costs of HIV-screening among blood donors. The best results indicate that 15 or 1.5% of false negative reactions sera will be missed, a figure still unacceptable, even in countries where economical resources are badly needed.

Aspects culturels et sociaux de la sexualité Cultural and Social Perspectives of Sexuality

M.G.0.7 CULTURE, SEX AND SCIENCE: ANTHROPOLOGICAL PERSPECTIVES FOR AIDS PREVENTION AND CARE
de Saldwando, Barbara. Harvard School of Public Health, Boston, MA, USA.

The production of sexual HIV transmission world-wide has led scientists from diverse disciplines and countries to probe the determinants and measures of sexual attitudes and norms. A scientific approach to sexual, because neither investigators nor subjects are free from bias: Culturally based assumptions and values shape personal sexual behavior, and other representations of and responses to the proposed behavior of others. This paper contrasts anthropological with epidemiological approaches to the scientific study of sexual risk behavior. It highlights theory and methods for mapping and evaluating determinants of observable practices (e.g., economic, social and health conditions), and unobservable realities such as perceptions, intentions, values, self-concept and social meaning, all of which are culturally constructed, systematically interrelated, and which often vary by age, gender and social position.

Moreover, sexual risk-reduction strategies promote changes in behavior for selfish reasons. That is, they intersect at least in highly-charged and culturally variable domains: those of sexuality and illness. Since AIDS prevention relies upon voluntary changes in behavior, accounting for perceptions, concepts and meanings in both domains are essential tasks for prevention-oriented research and effective interventions. To analyze such factors in the name of science is unscientific, and it detracts from the real challenge: appreciating culturally-grounded medical work.

M.G.0.8 CULTURAL, SEXUAL AND SOCIAL PERSPECTIVES OF AIDS IN BRAZIL
PINAL, Aletéia

*Centro de Referência e Treinamento-AIDS, São Paulo, Brazil
Brazil, with 140 million inhabitants and US\$ 140 billion in external debt, is a country of contrasts. The State of São Paulo (33 million) contributes 41% of the gross national product and boasts a per capita income of US\$ 3000. Nevertheless, 1,207,696 families (avg. 4 members) earn less than US\$ 60 a month, 10% of the state population is illiterate, 35:1000 is the mortality rate for children under the age of 5, 50% of public elementary school children are malnourished, and the maternal mortality rate is 116 for women between the ages of 15 and 49. Despite of being a rich state, 39,000 cases of Hansen's disease and 16,000 cases of tuberculosis were notified in 1988. As of 1988, 65.4% of the AIDS cases in the nation were from São Paulo (more than 70% from the city of São Paulo). Brazil is the largest Roman Catholic country in the world. However, it has the largest concentration of spiritualism and the city of São Paulo is considered the cultural capital of Pentecostalism. Afro-Brazilian cults are deeply seeded in the culture. Although Brazil gives a touristic image of a sexually permissive country, it is essentially a very conservative one. Sex is still a taboo subject and, even though it may be a source of pleasure, for many it is a way of survival.

M.G.0.9 ADOLESCENT SEXUALITY IN EUROPE
Slikkerveer, L. Institute of Culture and Social studies, University of Leiden, Leiden, The Netherlands.

M.G.0.10 AIDS AND THE SOUTH AFRICAN CULTURE
SANKHOSHE, MUSA, CHRISTIE, G.

THE AIMS CENTRE, SOUTH AFRICAN INSTITUTE FOR MEDICAL RESEARCH (SAIMR), JOHANNESBURG, SOUTH AFRICA

OBJECTIVE To describe how the South African Cultures influences the AIDS epidemic. **METHOD** An action research methodology was used. Data was collected over a sixteen month period from people seeking services from the AIMS Centre (SAIMR). The multi-cultural population consisted of male and female, adolescents and adults, from major cities and towns throughout south Africa, as well as dependent and independent townships. **RESULTS** Two broad aspects of South African culture have been recognized for their influence on AIDS. Firstly, the ideology and practice of apartheid and secondly, that services such as education and counselling are generally imported, decontextualized, non-African and therefore inappropriate for Third World clients. South Africa is a culturally diverse society that requires multicultural rather than monocultural practices. **CONCLUSION** The apartheid system together with a eurocentric theory of human behaviour severely restricts the control and prevention of AIDS in South Africa. It is advocated on helping professionals to be aware of the structural determinants of problems, and also to revolutionize the delivery of AIDS services so as to benefit people from a variety of cultural backgrounds.

M.G.0.11 "Sexuality in Africa: The Role of Cultural Beliefs and Behaviour".

By Violet N. Kimani,
Dept. of Community Health,
University of Nairobi, Kenya.

Abstract.

In this paper sexuality is defined according to age and sex of the participants. Sexuality for men and women?

Examples from a selection of ethnic groups are used to illustrate beliefs and expected behavior. Population discussed include adolescents in schools, colleges and places of work. Spouse both young and not too young are also included.

The influence of social change as that which is brought about by formal education, Christianity and the mass media is considered.

Discussions are centered on the role that a return to traditional beliefs could play to avoid risk behaviour in sexuality.

Les nourrissons à risque : Le point de vue africain Infants at Risk: An African Perspective

M.G.0.19 INFANT MORBIDITY AND MORTALITY IN UGANDA
A.L. MURDOCK - Dept. of Paediatrics Makerere University,
P.O. Box 7072, Kampala.

OBJECTIVE: To review the causes and rates of infant morbidity & mortality in Uganda from 1985-1988 and to determine the impact of HIV infection on the infant's morbidity & mortality rates in Uganda.

METHOD: A review of literature (data) on the causes and rates of infant morbidity and mortality 1985-1988 in Uganda was made with special reference to a study on the HIV impact.

RESULTS: 1 Year 1985 1984 1985 1986 1987 1988
IME 110 105 106 140 133 98

The leading causes of infant morbidity & mortality still remain mainly infective and preventable diseases as illustrated in a district mortality survey in 1988-respiratory tract infections (RTI) 16% of all deaths, diarrhoea 15%, malaria 10%, measles 10%. In the follow-up study 12.6% of the infants born of HIV positive mothers died before their first birthday as opposed to only 2% of a comparable group of infants of HIV+ve mothers. The causes of mortality among the HIV positive group were failure to thrive 45%, diarrhoea 16%, measles 10%, RTI 5%, meningitis 5%. The only infant who died in the control group died of RTI.

CONCLUSION: 1. The causes of morbidity and mortality in Uganda remain the same i.e. preventable & mainly infective diseases. 2. In recent years the IME in Uganda has generally been declining. 3. HIV infected infants had higher morbidity & mortality rates but overall the HIV infection has not increased the IME in the country.

M.G.0.20 INFANT MORBIDITY AND MORTALITY IN MALINDI.
Datta, Pravilba. University of Malindi, Kenya.

OBJECTIVE: To assess morbidity and mortality in infants of HIV+ mothers. **METHOD:** Systematic follow-up from birth of infants of HIV+ (study) and HIV- (control) mothers.

RESULTS: One hundred and fifty-five study infants and 353 controls have been followed for a mean of 10 (range 0.5 to 38) months. Study infants had more episodes (per 100 infant months of follow-up) of febrile illnesses (14 vs 13, p<0.1), diarrhoea (10 vs 8, p<0.05), cough/CR vs CR, pneumonia (2 vs 1.6, p<0.1), and otitis media (1.8 vs .6, p<0.01). Failure to thrive (FTT) occurred in 31/155 (20%) study infants versus 27/353 (8%) controls (p<0.01). 95% (151/157) study infants and 1/101 (1%) control (p<0.001) were immunized in 7/70 (10%) study infants and 1/101 (1%) control (p<0.001). 95% (151/157) study infants and 2 of 98 control infants, 2 infants from each group had chickenpox. Infant mortality (IM) was higher in the study group 12/155 (7.7%) vs 6/353 (1.7%), p<0.01. Infants of HIV+ mothers with more advanced HIV disease or subsequent death had higher IM, FTT and OM than infants with asymptomatic mothers. **CONCLUSION:** Infants of HIV+ mothers have repeated and severe childhood illness leading to FTT or death. Infants of HIV- asymptomatic mothers are at greater risk of dying, FTT or frequent illness.

M.G.0.21 RISK FACTORS FOR MATERNAL-INFANT TRANSMISSION IN ZAMBIA

Byers, Robert W. Projet SIDA, Kinshasa, Zaïre

M.G.0.22 BREAST MILK AS A RISK FACTOR FOR HIV-1 TRANSMISSION.

Hipa, Subhash

University Teaching Hospital, Lusaka, Zambia.

HIV-1 may be transmitted from an infected mother to her fetus during pregnancy or childbirth or immediate post-partum period. Although virus isolation from cell-free breast milk has been documented, the contribution of breast feeding in latter modality of transmission of HIV-1 has been questioned. There are, however, at least 8 case reports of HIV-1 seronegative women at the time of delivery, who during immediate post-partum period (usually through receipt of HIV-1 infected blood transfusion or drug abuse) got infected. These mothers and their breast-fed children seroconverted. While other routes of transmission could not be excluded in some cases, it was suggested that children were infected through breast milk. In Lusaka, we prospectively followed 16 maternal incident cases and their children for 2 years (mothers and children were p24 and antibodies negative at labor). Mothers acquired HIV-1 through heterosexual route. Subsequently, 3 mothers infected their children who seroconverted at 18, 20, and 22 months of age, respectively. No risk factors other than breast milk were identified. **Conclusion:** The sequential seroconversion of mothers and children is suggestive of possible transmission of the virus through breast milk. Since advantages of breast feeding outweigh the possible risk of HIV-1 transmission, breast feeding may not be discouraged till more information is available.

M.G.0.23 SAFETY AND EFFICACY OF IMMUNIZATIONS WITH LIVE VACCINES,
Edwards, James. University of Medicine, Kingston, Canada.

Objective: To review the safety and efficacy of live oral and bacterial vaccines given to children of HIV+ mothers.

Methods: Review of vaccination complications following BCG, oral polio vaccine (OPV) and measles vaccine used in the perinatal HIV transmission study in Kenya.

Results: BCG: Although 6 HIV-infected infants have been reported with respiratory disease and/or lymphadenitis following BCG vaccination, neither have occurred in 120 infants of HIV+ mothers given BCG in this study. Failure to respond to PPD testing occurred in 28/60 (20%) study vs 28/62 (45%) control infants (p<0.02) (OR=2.8); 95%CI=1.13-7.19). OPV: Polio did not develop in either infant or family members following administration to 137 infants of HIV+ mothers. Short and long term anti-polio antibody testing is not yet completed. Measles: 61 infants of HIV+ mothers have received measles vaccine without sequelae; 1/8 had protective antibody production vs 10/15 controls tested to date. Measles developed in 7/70 (10%) study infants vs 1/101 (1%) controls (p<0.004; OR=1.1; 95%CI=1.3-81.0) prior to vaccination. One of 61 study and 2/98 control infants developed measles despite vaccination.

Conclusion: Complications from live vaccines are rare in infants of HIV+ mothers. Continued BCG use should be reserved for areas of high tuberculosis risk. In developing countries, OPV is not contraindicated. Significant HIV presence in an area may hamper existing control measures. A more efficacious measles vaccine which can be safely given to infants prior to 9 months of age is needed.

IMPACT ON THE HEALTH CARE SYSTEM
Over, Head, Washington, D.C. USA

M.G.O.33 The Impact of HIV on the Laboratory in Developing Countries

John Shao - Muhlabili Medical Centre, Dar es Salaam, Tanzania
Most blood tests currently available in the markets for AIDS screening in the laboratory measure antibodies against human immunodeficiency virus (HIV). There are no tests so far developed that are one hundred percent perfect. Under ideal laboratory conditions both ELISA and Western blot are capable of achieving greater than 99% sensitivity and specificity. Screening of blood samples in Africa have caused problems concerning false and negative results. Besides there is a burning issue of stability of testing materials under difficult conditions. Further more the tests must be easy to perform and need without high and expensive technology unaffordable by most laboratories in developing countries. There is an urgent need to evaluate the performance of tests in field conditions.

M.G.O.35

M.G.O.32

CASE STUDY: SOCIAL ECONOMIC IMPACT OF AIDS IN A HOME
ELIZABETH N. NGUGI
UNIVERSITY OF WAIKATO, DEPT. OF COMMUNITY HEALTH

In July 1987 a young man in his early twenties went abroad for higher learning. He had been tested for HIV antibodies before departure and found negative. Ten months later he came back with AIDS and was hospitalized, improved and discharged home. Parent (mother) took compassionate leave to care for him. This presentation sets to show the changes the family had to make and how they coped with effects of the young man in that community.

The young man stayed at home for about a month where I visited him twice a week. Counselling was seen as an element of support. He was then readmitted and died a week after admission.

This case study would have been impossible without kind permission and inherent co-operation from the parent (names and photographs withheld on request).

SOME CORRELATES OF PERCEIVED VULNERABILITY TO HIV INFECTION IN SIX LATIN

Authors: Ceballos, M.**, Alvarez, A.**, Tavel, S.**, Vermeulen, J.**, Institute of Biostatistics, University of Chile, St. Bernardo, Chile. Belec, M.**, Rodriguez, J.**, Center for Studies in Public Health, World Health Organization, Geneva, Switzerland.

Objective: To investigate factors of personal behavior on perceived vulnerability to HIV infection by providing an answer to the following question: what are the socio-demographic, sociologic, attitudes and practice variables that differentiate the minority of respondents who regard themselves as likely to get AIDS from those who do not?

Design: Using the data obtained through a large-scale RAB survey in St. Louis, Chile 13 per cent of respondents were found to be concerned about their personal vulnerability to HIV infection. These were compared with those respondents who do not have such knowledge about HIV infection. The variables considered as potential risk factors were: age, sex, residential status, religious, educational, marital status, self-esteem, knowledge, attitudes, beliefs and practices.

Results: Of the large number of variables considered only a few indicated statistically significant differences between the two groups. While none of the observed differences are in the expected direction, most others are not. Thus, perceived personal vulnerability seems to be only partially related to most objective measures of risk appears as age, sex, residential status and sexual activity.

Conclusions: These findings should be taken into account in developing IEC campaigns on AIDS.

T.G.0.8

THE CHALLENGE OF ADOPTING RISKY PRACTICES IN WELL INFORMED GAY MEN.

Authors: Alarcon, Sepulveda P., Valenzuela J.L., Ramon M., Ramos R. Division of Epidemiology, Ministry of Health, MEXICO. Hastings, J. Objective: To describe the process of production of graphic educational material, and its possible impact on the promotion of condom use in a gay men with a high level of knowledge about AIDS in Mexico. Methods: With knowledge, attitudes and practices data about AIDS and its preventive measures in gay and bisexual men from Guadalajara City, Mexico (St. 87 and May 98), a sociodemographic and educative needs profiles were done. Different concepts were tested through focus groups in the population. With the chosen concepts, 2 posters, 2 condom wallets and 1 comic were done and distributed in July 98. In centers where gay men meet (saunas, bars, etc) by staff members with the collaboration of gay community. Another survey was carried out after the distribution of the material in August. The messages included in the condom wallet are that AIDS is an STD, prevention and detection of condom and addresses of reference centers. These messages were distributed through five different projects: 1) to casual contacts and 2) to stable couples, according to the selected design. Results: Since the first survey, an appropriate level of knowledge of the principal variables was higher than 80%, messages of reference were not included, although there are still some gaps. The prevalence of condom use was increased slightly, whereas it is noted that the change is higher between the second and third survey when controlled by having removed the graphic material.

Prevalence of condom use 1987 - 1988		Condom use by detection of material	
Sex	Age	Sex	Age
Men	25	Men	25
Men	35	Men	35
Men	45	Men	45
Men	55	Men	55
Men	65	Men	65
Men	75	Men	75
Men	85	Men	85
Men	95	Men	95

Conclusions: It is particularly complex the design of educational material for well informed groups with educative attitudes towards prevention but with high prevalence of risk practices. The challenge in gay and bisexual men is exactly the case. Perhaps the only way to modify high risk practices is with the combination of the design of focused educational material with adequate channels of distribution.

T.G.0.9

MASSIVE CAMPAIGN FOR AIDS EDUCATION, ACHIEVEMENTS AND PROBLEMS
Buenos Aires, 1989. Traverso J.F., Valenzuela J.L., Munniching R.,
Toussaint J.**,
Institute of Epidemiology, Ministry of Health, MEXICO.
Population Council

Objective: To describe the principal achievements and problems of the mass media AIDS prevention campaign.
Methods: The educational campaign through mass media in Mexico began in April 1987. In September, 1987 and May, 1988, 4 surveys to determine the knowledge about AIDS in general population were carried out in 6 cities in Mexico. Simultaneously, an analysis of press contents was undertaken.

Results: The first and second surveys showed 91% and 80% identification of sexual transmission mechanisms (90, 90% and 94% identified blood, and 88% and 89% parental; 7% and 7% identified AIDS as a disease to which everybody is susceptible; 81% and 80% identified it as an infectious disease and 77% and 80% identified AIDS as preventable. Myths about transmission are still frequent, although there is a decreasing trend, e.g. 30% and 31% think HIV can be transmitted through casual contact. Condom use was stable, 20% and 32% referred having ever used a condom. The knowledge of AIDS prevention through the use of condoms increased from 61% to 77%. Critiques arising from different groups condemned the use of the word "condom" believing that the "promotion of condom would increase sexual freedom, promiscuity, prostitution and male homosexuality". Some other groups requested that the campaign "should be more aggressive" in its contents. This discussion, however, positioned the condom on the top of people's mind.
Conclusions: Mass media campaigns directed to general population, do not modify practices (nor may not preventive), however, they are useful to create proper perception of the magnitude of AIDS and decrease myths and stigmatization. These campaigns may influence decision-makers to support programs for AIDS prevention.

T.G.0.10

AN INTERNATIONALLY ADAPTABLE AIDS PREVENTION PROGRAM FOR

YOUTH
Youn, Wendy**, Menton, S.**, Vally, R.**, and Renaud, L.**,
Adolescent Alliance, Los Angeles, CA, USA. **Adolescent Alliance** Centre for
SEX (AACS), Paris, France, **Association des Antistes Centre for SEX,
Paris, France.

Objective: To set up a volunteer-based AIDS education program where trained young people speak directly to their peers in academic settings
In school AIDS transmission and prevention. Methods: Adolescents and young adults are recruited through announcements on national television shows and publications targeting the youth. After an intensive training on basic AIDS information and communication skills, the young speakers lead small group discussions with comparably aged youth, the issues of how HIV is transmitted and how to protect oneself from HIV exposure are emphasized. All AIDS-related concerns are addressed. **Results:** With the use of video films and AIDS informational brochures targeting teenagers and parents, thousands of junior and senior high school students in France have shown an increase in AIDS knowledge and prevention as evaluated by a pre/post-attitude questionnaire. Parents have an active role in the educational program as well. **Conclusions:** The AIDS program, adapted from the Adolescent Alliance Project Education Program in the USA, is culturally sensitive to the needs and AIDS-associated concerns of youth in France and can be applied to other countries in the world. The international model is inexpensive and easy to implement and evaluate.

T.G.0.11

ADOPTION OF SAFER SEXUAL BEHAVIOR BY AN HIV HIGH RISK GROUP
OF BAR HAD
Watt, M., Aida C.,** Serge P.,** Siro J.,** Bouchay Helen C.,** Blandford G.,** et al.

Objective: To study the adoption of safer sexual behaviour by a group of bar and restaurant workers at high risk of HIV infection in Bar de Salinas, Venezuela.
Methods: After recognizing the rapid rise in HIV infection survey measurements and bar workers in Bar de Salinas where the prevalence rose among female workers increased from 20.4 in 1986 to 45.4 in 1989 (prevalence in males were 38 in 1986 and 53.8 in 1989) efforts were made to request health education, individualized counselling and free provision of condoms to the group.

Results: 366 workers (156 male and 210 female) out of 637 (240 male, 397 female) originally enrolled in the study were available for follow-up after 3 months. 263(69%) of the workers had not adopted any sexual behaviour change due to the theme of AIDS. 101(40.3%) had had only one sex partner, 131(31%) had stopped having sex, 40(12.7%) were using condoms all the time and 122(46.9%) had reduced the frequency of changing sex partners. The prevalence of utilization of condoms increased from 29.19 to 67.14 during the 3 months of follow-up. 245(46.6%) of the workers considered a policy of 3 condoms per week to be adequate. 96(21.1%) explained no condom at all while 46(10.1%) did not use any condom.

Conclusions: Intensive health education and counselling with provision of condoms have a good chance of success in reducing the rapid spread of HIV infection among groups of individuals engaging in high risk sexual behaviour in developing countries.

T.G.0.12

THEORY AND PRACTICE IN PROMOTION OF SAFE BLOOD
IN KAMPALA, UGANDA. Katabaha, F., Coutinho, S.,** and Sanyang, P.,
Nakasero Blood Bank, Ministry of Health, Uganda.

Objective: For the past two years, it has been policy to screen all donated blood for anti-HIV before transfusion. In November 1988, the Ministry of Health and European Development Fund joint project of an all volunteer blood bank in Kampala started operation.

Methods: Prospective donors get information, both verbal and written, concerning the transmission of HIV-1. Blood is given anonymously, but one week later the donor can use a code to request the test result. Each sample is tested by a first generation EIA method (Vironostika, Organon). Positives are confirmed by a competitive inhibition EIA (Uniform Anti-HIV-1, Organon). Negative sera are retested by EIA using synthetic peptides as antigen (Biochrom, Inc.). Donors with confirmed positive tests have a second sample checked before getting a definitive result. **Results:** During the first three months we have found: 1. Positive results in 91 of donors. 2. Donors informed of positive results. With accurate information, donors make appropriate behaviour decisions. 3. Some donated blood sero to obtain an HIV-1 antibody test. **Conclusion:** The implications for blood bank policy in Uganda will be discussed.

T.G.0.19 PROGRESSIVE INCREASE IN HIV-1 SEROPREVALENCE IN PREGNANT HAITIAN WOMEN: 1984 THROUGH 1985
Rouquié, Réginald*, Halsey, M., Holt, E**
Quinn, C**, Huff, R., Brutus, J**
**Centers for Health and Development, Port-au-Prince, Haiti;
*Johns Hopkins University, Baltimore, MD, USA

Objective: To determine changes in HIV-1 seroprevalence in pregnant Haitian women residing in a perinatal clinic in a perinatal unit were screened by HIV-1 ELISA and confirmed by WB. Prior studies have demonstrated that heterosexual contact is the predominant mode of transmission.

Results:	1984	1985	1986	Total
Number Screened	1245	2009	1074	4328
% HIV-1 Positive	8.88	9.98	10.53	9.78

Increases were most notable in the 20 to 34 year age groups. 1986 seroprevalence by age: 14-19 yrs (9.3%), 20-24 yrs (11.5%), 25-29 yrs (11.3%), 30-34 yrs (9.1%), 35-39 yrs (4.0%), 40+ yrs (5.3%). The seroprevalence rate (16.7%) in 1986 was in women in their third pregnancy, but 6% or more of women pregnant for the first time were HIV-1 seropositive each year. **Conclusions:** Many women are becoming infected soon after becoming sexually active and transmission rates remain high. A control program is urgently needed.

T.G.0.20 HIV-1 IN HOSPITALIZED HAITIAN PEDIATRIC AND ADULT PATIENTS
Adrien, Marcio*, Boulog, M*, Louis, A*, Joseph, P*, Kissinger, P*, Halsey, M., Holt, E**
**Centers for Health and Development, Port-au-Prince, Haiti,
*Johns Hopkins University, Baltimore, MD, USA

Objective: To determine the HIV-1 seropositivity rate and related symptoms of hospitalized patients in an urban primary care hospital.

Methods: All patients admitted to the general pediatric and adult wards were screened anonymously for HIV-1.

Results: Of 177 adult admissions, 37(21%) were HIV-1 seropositive. Of 372 pediatric admissions, 44(11.8%) had HIV-1 antibodies in their sera and 45(13.5%) of 333 of their mothers were HIV-1 seropositive. Although higher rates of HIV-1 seropositivity were observed in children with gastroenteritis (12.8%), weight loss (11.9%), and/or rash (18.2%), significant (p<0.05) associations with HIV-1 seropositivity were observed only with cough and pneumonia (29.2%). Since 71% of the children were < 1 year of age, the presence of maternal antibodies could not be ruled out. Two HIV-1 seropositive children 11 and 13 years of age who had not had transfusions were identified. **Conclusions:** High percentages of pediatric and adult patients requiring hospitalization in this population are infected with HIV-1 and have a mother with HIV-1 infection. Pneumonia may be a predictor of HIV-1 seropositivity.

T.G.0.21 PREVALENCE OF HIV-1 AND HTLV-II IN GONAIVES, HAITI
Boulog, Réginald*, Halsey, M., Quinn, C**, Zertour, J**, Labrun F**, Halsey, M**, Holt, E**
**Centers for Health and Development, Port-au-Prince, Haiti **Family Health International, Research Triangle Park, NC, USA **Johns Hopkins University, Baltimore, MD, USA

Objective: To determine the prevalence of HIV-1 and HTLV-II infection in a semi-urban area outside of Port-au-Prince.

Methods: Between April and November 1985 a total of 1863 men and women aged 15-45 obtaining medical services at 2 health centers in Gonaives, Haiti, were recruited to participate in this study. Serum specimens were collected from each participant and information on demographic characteristics and selected risk factors for HIV-1 and HTLV-II infection was obtained using a brief structured questionnaire. Serum specimens were tested for antibody to HIV-1 and HTLV-II by ELISA, and repeatedly positive samples were confirmed by Western blot.

Results: Preliminary results indicate the prevalence of Western blot confirmed HIV-1 antibody to be 9%. Additional results on the prevalence of HTLV-II infection and on the prevalence of co-infection will be presented. **Conclusions:** Two seroprevalence studies have been conducted outside of Port-au-Prince, the capital. These results indicate that the prevalence of HIV-1 infection is high in Gonaives, a semi-urban area northwest of Port-au-Prince. Appropriate educational interventions to reduce the spread of HIV-1 infection and additional research to better define risk factors important in this population are needed.

Key words: HIV-1; HTLV-II; Haiti; prevalence; risk factors

T.G.0.22 RISING PREVALENCE OF ANTIBODIES AGAINST HUMAN IMMUNODEFICIENCY VIRUS (HIV-1) IN WESTERN HANGARU, INDIA
K. SANCHEZ, National Institute of Virology, Pune, India.

Until recent years HIV infection was considered a rare event in India. In 1982, 3/855 paid blood donors from Pune were seropositive and in 1984, 3/495 were positive. From Bombay, a single sero was positive in the 4th quarter of 1987, since then 33 have been found positive. All were males; from a STD clinic in Pune, a single sample of blood was positive in 1987, while in 1988 there were 28 seropositives. From Gomay, a single sample was positive in 1st quarter of 1987, by the end of 1988 there were 56 positives, 46 being males and 10 females. Of the 449 sera collected from female prostitutes in Pune between 1985-87, only two were seropositive. From Bombay, 3 were found positive in the 2nd half of 1986, by the end of 1988, there were 78 positives, 62 in the last quarter. Among hospitalized patients (total 370) in a Pune hospital, only one of 863 tested was positive, which was from a group of 292 patients of tuberculosis. From Bombay, 1 out of 15 tuberculous and 2 out of 70 cases of chronic renal failure were seropositive, obviously due to transfusion. The limited serosurveys from Bombay, Pune and some other cities in Western India indicate that the HIV infection is spreading rapidly in the urban areas among the prostitutes and their clients (as evidenced by the progressive rise in seropositivity in STD clinics) and paid blood donors. The current status warrants wider serosurveys to assess the spread of infection and immediate implementation of anti-epidemic measures.

T.G.0.23 SECOND SEROPREVALENCE SURVEY AMONG BANGKOK'S INTRAVENOUS DRUG ABUSERS (IVDA)
S. Vaisidharn*, K. Sombhat*, K. Plangrungsri*, P. Akaravivorn*, R. Wright*, K. Choo-panya*, Bangkok Metropolitan Administration, Piv. Div., Min. Pub. Hlth, INDIA

Objective: To (1) determine prevalence and (2) risk factors for HIV infection and (3) measure behavioral change in an estimated population of 15,000 registered drug abusers in Bangkok.

Methods: Each of 15000 registered drug abusers in Sept. 1985, a 100% sample of detoxifiants was asked to consent to an interview with a social worker and give a blood sample. **Results:** Among 15000 interviewed, no one refused, 44% were HIV+ up from 16% in February. Significant risk factors emerging from multivariate analysis were equipment sharing (OR: 6.95(2.1-2.4) and hand job of being arrested in 1980, OR: 2.0(1.2-2.8). We examined responses to behavior one month before interview compared to 4 months before test. Equipment sharing declined from 60% (sharing with 4+ people from 23 to 18%), condom use among those sexually active was low (7%), and exchanged HIV+ and IVDA claimed to clean their equipment; the methods they used remained ineffective.

Conclusions: HIV infection was being increasing 1 point per month among Thai IVDA in 1986. Widespread injection equipment sharing is a key risk factor. There is no sign in mid-1986 that IVDA are changing their sharing, needle, or condom using behavior in response to intervention programs.

T.G.0.24 AIDS IN PAPUA NEW GUINEA - HETEROSEXUAL TRANSMISSION AND SOME IMPORTANT LOCAL CONSIDERATIONS
Makin, Gilbert, Currie, B., Morde, P., and Pyakala, T. Department of Health Papua New Guinea.

The first positive HIV antibody result reported to the Department of Health in Papua New Guinea (PNG) was from June 1987. The first confirmed AIDS case was reported in April 1988. By the end of 1988 there were 10 confirmed AIDS cases. The first 5 were expatriate males with P. carinii pneumonia, 1 homosexual, 1 bisexual. The other 5 were PNG nationals, aged 18-27 years, and all had died by late 1988. Of these 5 there were 3 females and 2 males who had had heterosexual partners and 1 operator who was bisexual. Four cases fulfilled the criteria for HIV wasting syndrome ("AIDS disease"), and 1 had retroviral HIV antibodies in the indicator disease. Candidiasis and skin lesions were also evident in some cases. HIV infection was documented in the regular female sexual partners of the 2 male rationales. Intravenous drug abuse is virtually unknown in PNG, but the reported incidence of STD has risen alarmingly in the last 10 years. In particular ulcerative disease from syphilis and chancroid is common. The importance of traditional sexwork and sexification remains unclear, as does that of ritual homosexuality which is confined to limited areas. Multiple use of single syringes still occurs throughout the country. Our preliminary data together with the high prevalence of tuberculosis suggest that the PNG AIDS epidemic is likely to follow the African pattern, with heterosexual spread and p. t. being presenting with wasting and tuberculosis.

W.G.0.13 AIDS AND RESTRICTIONS ON IMMIGRATION AND TRAVEL: U.S. POLICY AND ITS RATIONALE.
Roeder, Richard E.*; Whitaker, Rupert E.**
 *Northwestern University and Boston, Boston, U.S.A., **Boston University and Tufts New England Medical Center, Boston, U.S.A.

Objective. To evaluate the efficacy of the U.S. government's policy of including immigrants with AIDS and HIV infection. **Methods.** WHO data on AIDS were used to obtain estimates of the prevalence of HIV infection for those countries reporting in February, 1988. These estimates, along with data on the volume (and country of origin) of immigrants entering the U.S., were used to examine the outcome of mass HIV antibody testing of applicants for immigrant status. The study examines the adequacy of ELISA and Western blot tests as measures of HIV infection, particularly with a view to border controls as a means of controlling the spread of AIDS. **Results.** The proportion of test results that are false varies according to the prevalence of HIV infection in the population being tested. Thus applicants from "high-risk" areas are more likely to produce false negative results, while immigrants from "low-risk" areas are more likely to produce false positive results. The policy of excluding seropositives from the U.S. will therefore be ineffective, but will affect applicants from certain areas more severely than others. **Conclusion.** Attempts to contain the AIDS epidemic in the U.S. by exercising border controls will not only be ineffective, but also counter-productive as other countries will respond by imposing controls upon U.S. citizens.

W.G.0.14 COMPARISON OF NATIONAL AIDS STRATEGIES IN AUSTRALIA AND CANADA.
Dunn, Margaret
 McGill Centre for Medicine, Ethics and Law, Montreal, Quebec, Canada.

OBJECTIVE - To delineate a policy framework and examine the development and implementation of National AIDS strategies in Australia and Canada with attention to consultation, policy directions, resource allocation, time frame, consistency and comprehensiveness. **METHOD** - A review of the evolving social, political and legal positions dealing with HIV infection in Australia and Canada based on interviews and published reports. **RESULTS** - Issues include: 1) The accepted basic principles which underlie the process of policy formulation. 2) The areas and limits of responsibility that are drawn. 3) The ethical issues that are addressed, both overtly and covertly. 4) The identifications of those groups whose input is crucial. 5) The guidelines adopted for resource allocation. 6) The nature of arrangements. 7) Research priorities in biomedical, behavioral and social research. 8) The homogeneity of the national response. **Conclusion** - Despite similar health care systems and national disease profiles, critical differences between the two countries have occurred in the timing of the response, the extent of involvement of all relevant groups, the emphasis on and effect of prevention strategies and the extent to which national policies have addressed ethical issues. The characteristics of a recommended national strategy are outlined, drawing on the strengths, and weaknesses of the two countries.

W.G.0.15 THE EPIDEMIOLOGICAL SURVEILLANCE SYSTEM FOR AIDS IN BRAZIL - CRITICAL ASSESSMENT
Rodrigues-Latt, Chequer, P., Bagnawell, M., Coutinho, E., et al.
 *Ministry of Health-National Division of STD/AIDS, Brasília, Brazil, **Oswaldo Cruz Foundation/Ministry of Health, Rio de Janeiro, Brazil.

Objective. To present methodological and operational aspects of the National AIDS Epidemiological Surveillance System. Critical assessment of the components of the system and presentation of the new epidemiological surveillance unit, updated surveillance. **Methods.** Qualitative and quantitative evaluation of the National AIDS Epidemiological Surveillance System using the current report form, standardized nationwide, which contains demographic data, on opportunistic diseases, results of laboratory tests and side effects. **Results.** The National AIDS Epidemiological Surveillance System was implemented in 1985 and since then has been progressively expanding its coverage and operational capacity. It is organized hierarchically, and its various levels of activities are defined. The data is organized and processed by epidemiological work, generating monthly feedback by means of national and state epidemiological bulletins. The reported form currently used may be considered satisfactory according to a study made in this paper. The new form to be presented will allow for the proposed new case definition based on the serological profile observed in research carried out by the National Division of STD/AIDS with the support of CDC-USA, and ongoing observations. The flow and quality of the data may be improved by the mechanisms proposed in this paper. The under-reporting cases can be reduced by its quantification, identification of bottlenecks, and the optimization and rationalization of procedures. **Conclusions.** The National Epidemiological Surveillance System is wide-ranging and is in the implementation phase. The retrospective review of consecutive years from 1985 up to its setting-up has been no important aspect in the development of the epidemiological profile of AIDS in Brazil. The proposed new form is expected to make the System more operationally responsive and enable better knowledge of the epidemiological profile of AIDS. The flow of data, can be optimized and consequently lead to an improvement in the processing and analysis of the System. In addition, the system will provide guidelines for evaluation of the National Surveillance System.

W.G.0.16 FUNCTIONAL AND DYSFUNCTIONAL AIDS PREVENTION PROGRAMS IN LATIN AMERICA AND THE CARIBBEAN
Fernando H. Zarzarán, Laurence F. Zaslauer, Gloria Nogueira, Evely Lombardo, and Ronald K. St. John
 Pan American Health Organization, Washington, D.C., U.S.A.
 Global Program on AIDS, World Health Organization, Geneva, Switzerland

Objective: To assess the functional/dysfunctional status of AIDS prevention programs in Latin America and the Caribbean (LAC) from a managerial perspective. **Method:** Following WHO guidelines, we assessed the structure of national AIDS programs as well as their efficiency or capacity to implement planned activities (activities completed/activities programmed). **Results:** As of 1 January 1989 all of the 36 PAHO Member Countries had a national AIDS prevention focus. However, the structure and functions of the national AIDS prevention programs varied greatly among countries at comparable stages of the epidemic. For example, of the twenty Latin American national programs ten were considered to be using resources more rapidly and more efficiently than the rest. Eight of these ten countries had a full-time manager devoted exclusively to the AIDS/STD program. These countries showed evidence of "strong" governmental political and financial commitment to the AIDS prevention effort (e.g. composition of the AIDS commission, internal funding, legislation, and active search for external bilateral or multilateral support). In contrast, these two factors were present in only two of the ten less active programs. **Conclusions:** Our preliminary data seem to indicate that certain program characteristics may predict the efficiency with which national programs are implemented.

W.G.0.17 STRATEGIES OF THE EC'S AIDS PROGRAMME FOR DEVELOPING COUNTRIES TO CONTROL SEXUALLY TRANSMITTED HIV INFECTIONS: DISCUSSION OF PROGRAMME IMPLEMENTATION AND MAIN RESULTS
LEADER: LAYNE, RD, PhD Van Dam, C.J., MD, RHC
 European Economic Community AIDS Control Programme/Developing Countries.

Sexual transmission is by far the most important way for HIV infection to spread. All STDs are behaviourally correlated and follow the same risk behaviour patterns, namely multiple or infected sexual partners. Risk workers persistently focusing of intervention efforts. Therefore the basic approach of the EC's AIDS Programme has been to place AIDS within the context of other STDs. Main activities and issues are : focused information campaigns, organisation of adequate training, confidentiality, use of STDs as indicators as well as for evaluation of intervention, adequate management of genital ulcers and other STDs and strengthening of STD and AIDS programmes. All activities have been undertaken in collaboration with WHO. Against this background we will present the first results of programme implementation, operational research and evaluation. A quick assessment method for STDs and AIDS has been developed. The epidemiological recovery issues and resources availableity have been analysed and discussed in view of sustainability and resource allocation. Applicability, feasibility and impact will be analyzed for a few examples of interventions in specialised STD clinics or integrated in primary health care facilities.

W.G.0.18 NATIONAL AIDS PROGRAMME: PROGRESS ACHIEVED AND OPPORTUNITIES FOR FURTHER DEVELOPMENT
Sherris, Dennis; Newn, Jovanett, World Health Organization, Global Programme on AIDS, Geneva, Switzerland

The global collaboration against AIDS increased considerably in 1988 as Governments were seeking to respond to the worldwide spread of the HIV epidemic by establishing policies and undertaking aggressive programs. Of 183 countries and territories in the world, 163 had, as of 1 February 1989, sought a technical collaboration with the World Health Organization's Global Programme on AIDS, of which 153 had already received a technical collaboration. Of those, 118 countries had completed or were implementing a short-term prevention and control plan, while 51 had established on a 3- to 5-year medium-term programme. Of those, 27 were able to mobilize resources through pleading meetings (Table 1). The status of the global reaction to AIDS will be reviewed. Collaboration and cooperation within and between countries will be assessed and current issues encountered in improving programme performance will be discussed.

WHO GLOBAL PROGRAMME ON AIDS - NATIONAL PROGRAMME SUPPORT - 1 FEBRUARY 1989

Region	Collaboration	Technical	Short-term	Medium-term	Resources
	Number	Number	Number	Number	Million

W.G.O.31 THE HIV PROBLEMS IN WEST AFRICA FEMI SOYINKA,
OSAFUNMI ANGLLOW UNIVERSITY, ILE-IFE, NIGERIA.
Various studies in West Africa have shown that the prevalence of HIV and AIDS vary significantly from country to country. Even though data arising from countries are inadequate there are indications that HIV poses a threat to West Africa. The most frequently studied groups are prostitutes, STD patients and blood donors where prevalence rates are high. Parenteral transmission of HIV is also reaching alarming dimensions. Blood Transfusion induced AIDS - especially among sicklers, cultural related HIV transmission (e.g. medicinal tattoos, traditional blood letting, and polygamous practices) have not been adequately addressed in West Africa. The emergence of HIV-2 in West Africa around 1985 has generated a lot of scientific and political controversies. HIV-2 may be more prevalent in many West African countries than hitherto recorded. A better understanding of the clinical and immunological implication of infection through HIV-2 is needed through systematic epidemiological and clinico-pathological research. Clinical cases of HIV-1 infection do not differ much in West Africa, from other countries. The prevalence of particular pathogens might make for the differences. Clinical oriented surveillance is more needed in African countries where lack of laboratory facilities, and financial limitations prevail. Operational problems in respect of HIV research include scarce resources, and inadequate flow of information among African researchers. International effort can maintain the information flow to developing countries. AIDS programs should be integrated into existing health care organisations such as the MCH, NHC and STD. What is essentially important about AIDS in Africa is the severity of the problems and the failure to accept ship.

Th.6.0.1

AIDS AND TUBERCULOSIS (TB) IN THE USA
From: **M. Wiley, Hayward;** & **Ciesielski, C. Berelman, R. Pyers, J. Klich, A. Galt**
Centers for Disease Control (CDC), Atlanta, GA, USA

Objective: To compare AIDS patients with and without TB and identify risk factors for TB in AIDS patients.
Methods: Using logistic regression, we analyzed all AIDS cases reported to CDC from September 1, 1987 (when the CDC AIDS case definition was revised to include extrapulmonary TB) with lab evidence for HIV through January 5, 1989. **Results:** Of 40,366 AIDS cases, 1001 (2.5%) had extrapulmonary TB. TB was diagnosed definitively in 893, presumably in 100. AIDS patients with TB (AIDS/TB) did not differ by age from AIDS patients without TB. AIDS/TB occurred 3.1% of female AIDS patients vs 2.6% for males (<0.001). TB was reported in 1.3% of whites with AIDS, 1.7% of blacks, and 1.8% of Hispanics (<0.001). Of AIDS patients, 771 (3.1%) of US origin had TB, compared to 20 (7.3%) Mexicans, and 77 (13.0%) patients with AIDS. TB was reported in 4.4% of heterosexual intravenous drug users with AIDS, 1.4% of homo/bisexual men, and 5.4% of those with heterosexual contact as their AIDS risk factor (<0.001). In 33% of AIDS/TB patients, TB was the sole opportunistic infection (OI) reported; the most common additional OI was *Pneumocystis carinii* pneumonia. **Conclusion:** The 2.5% of TB in US AIDS patients should be considered an underdiagnosis, because pulmonary TB is not counted in the case definition and because disease occurring after the initial diagnosis of AIDS may not be reported. Significant variations in TB rates are associated with sex, race, national origin, and risk group. TB needs to be considered in all AIDS patients, particularly those with pneumonia.

Th.6.0.3

TUBERCULOSIS AND AIDS: OUR EXPERIENCE
From: **Hernandez J, Arizola I, Gonzalez Montaner J, Abate Z, de Souza J, Campuzano A, Cortez J and Basso G.**
AIDS Unit and Tuberculoz Division, Hospital de Niños, Buenos Aires, Argentina. **OBJECTIVE:** Determine the prevalence of TB as an opportunistic infection in the seropositive of the Injuria and the low incidence of the mycobacteria in patients with HIV infection in Argentina. **METHODS:** Between January 1986 and July 1986 we studied 17 patients with TB among TB patients with AIDS/6 were males and 1 was female). Age rang 15 to 45 years. There were 5 heterosexual (30%), 3 homosexual (18%), 1 bisexual and 1 was a hemophiliac with multiple blood transfusions. All of them were HIV serology by ELISA and WESTERN-BLOT POSITIVE. **RESULTS:** In 2 patients there were diffuse pulmonary infiltrates; 1 with pulmonary cavities, 1 with pleural effusions (1 of them with ascites), 3 with peripheral adenopathy (1 of them mediastinal involvement) and 1 pericardial and meningeal involvement. In 5 we obtain culture positive for *M. tuberculosis* (3 from sputum from seropositive, 1 bronchial washing, 1 pleural effusion and 1 blood culture) and in 5 we have histopathological result compatible adenopathic biopsias and 1 pleural biopsy) These patients responded to specific treatment (INH, RIF, 5 did and 3 are in treatment. We have not had typical epidemiology. The TB lesions in our patients are of atypical characteristics but of greater extension and cavitation than with non-AIDS patients. **CONCLUSIONS:** TB were founded in 21% of AIDS patients as an opportunistic infection. We have not had atypical epidemiology. In this context of whatever opinion of acid-fast bacilli must be considered as tuberculosis and treated as such. The TB lesions are greater extension and cavitation than with non-AIDS patients.

Th.6.0.5

A STUDY OF HIV INFECTION IN ASSOCIATION WITH TUBERCULOSIS
PATIENTS IN A TUBERCULOSIS DISEASE HOSPITAL (TDR) MARRONI, DANIEL E. KIRDOU, S.N. Gauthan*, P. Nune**
*Senior Medical Officer, TDR; **Physician, TDR.
*Tuberculosis Disease Hospital, MARRONI, KENYA
OBJECTIVE: Assess prevalence of HIV infection and associated complications in TDR patients seen in I.D.U. between January 1987 - June 1988.
Method: A total of 100 HIV seropositive patients by Western Blot and western blot confirmation when available and various aspects of HIV positive patients compared with randomly selected seronegatives seroposited by age and sex.
Results: 100 HIV seropositives were seen. Extrapulmonary disease was TB in HIV was against 9.38 in HIV one and normally despite effective chemotherapy was threefold in seropositives by the end of the 3rd month of treatment. There was no association between HIV positivity and drug resistant strains. The incidence of severe drug reaction in HIV seropositives was about five fold.
HIV Related complications

comp	yes	no	HIV related complications	yes	no
Diarrhoea	38	1	Herpes zoster	3	0
Wt. loss on chemotherapy	56	4	Mental confusion	4	0
Oral thrush	40	1	Severe drug reaction	1	0
Pleuritic dermatitis	17	1	Kaposi's sarcoma	1	0
Generalized lymphopathy	1	1	Chicken pox	1	0
Allergic drug reaction	27	6			

Conclusion: Tuberculosis control programme in Kenya is facing serious challenge due rising HIV infection

Th.6.0.2

**EFFECT OF TUBERCULOSIS INFECTION AT A TUBING
RESISTION CENTER IN BURELIMBA, MOZAMBIQUE**

Objective: 1- to identify possible changes in the prevalence and incidence of AIDS due to the introduction of the new TB infection criteria in the public surveillance system. 2- to determine the effect of the new criteria upon the surveillance criteria. 3- to describe the epidemiology over surveillance in the new definition.
Methods: Data from the surveillance registry of patients were used. The registry automatically collects information on all patients with HIV registered in Cahitanga, covering a population of about 4 million km, with using a hospital based active surveillance system. The HIV test case definition criteria were introduced by surveillance systems in January 1988.
Results: In 1- to identify possible changes in the prevalence and incidence of AIDS due to the introduction of the new TB infection criteria in the public surveillance system. 2- to determine the effect of the new criteria upon the surveillance criteria. 3- to describe the epidemiology over surveillance in the new definition.
Methods: Data from the surveillance registry of patients were used. The registry automatically collects information on all patients with HIV registered in Cahitanga, covering a population of about 4 million km, with using a hospital based active surveillance system. The HIV test case definition criteria were introduced by surveillance systems in January 1988.
RESULTS:

SEX	RESISTIBLE TB	ALL AIDS	NO RESISTIBLE TB	NO AIDS	RESISTIBLE TBLY AIDS
Male	28 (74.0)	18 (45.0)	18 (45.0)	18 (45.0)	18 (45.0)
Female	20 (51.0)	18 (45.0)	18 (45.0)	18 (45.0)	18 (45.0)
Total	48 (121.0)	36 (90.0)	36 (90.0)	36 (90.0)	36 (90.0)
Male	18 (45.0)	18 (45.0)	18 (45.0)	18 (45.0)	18 (45.0)
Female	10 (25.0)	18 (45.0)	18 (45.0)	18 (45.0)	18 (45.0)
Total	28 (74.0)	36 (90.0)	36 (90.0)	36 (90.0)	36 (90.0)

Conclusion: To evaluate the impact of the new definition criteria if it increases or less incidence or prevalence of TB in patients with HIV infection. The impact of the new definition criteria on the surveillance system is being studied. The criteria will probably be more sensitive to TB in men between 25 and 35 years old.

Th.6.0.4

THE IMPACT OF HUMAN IMMUNODEFICIENCY VIRUS (HIV) ON TUBERCULOSIS IN ZAMBIA: A CROSS-SECTIONAL STUDY
ELIACK, AIDOO*, MARRONI, DANIEL E. KIRDOU, S.N. Gauthan*, P. Nune**
*Senior Medical Officer, TDR; **Physician, TDR.
*Tuberculosis Disease Hospital, MARRONI, KENYA
*University of Zimbabwe, Harare, Zimbabwe
*Ministry of Health, Lusaka, Zambia
*London School of Hygiene and Tropical Medicine, London, UK.
OBJECTIVE: To study the impact of HIV on tuberculosis in Zambia.
METHOD: From November 1988 to January 1989 we have carried out a study of 300 patients on anti-tuberculous therapy in Lusaka, to be compared with smaller samples from 2 rural centres. The prevalence of HIV antibody detected by Western-blot ELISA and confirmed by Rappart. among these patients is compared with that found in age- and sex-matched blood donors.
RESULTS: Preliminary results on the first 100 patients are as follows:
Site of tuberculosis (number of patients) (seropositivity %)

Confirmed pulmonary	60	30	0
Suspected pulmonary	64	58	0
Pleural	31	25	0
Pericardial	8	8	0
Lymph node	8	8	0
Other	1	1	0

When the study code is broken further data analyses will be available.
DISCUSSION: Tuberculosis is emerging as the major bacterial pathogen in patients infected with HIV in Central Africa. It is both common and treatable. But high questions arise regarding the management of tuberculosis when it occurs in association with HIV. Current data from this study will be presented including at guiding further investigations of these issues.

Th.6.0.6

ASSOCIATION OF TUBERCULOSIS AND HIV INFECTION IN ZIMBABWE
MARRONI, DANIEL E. KIRDOU, S.N. Gauthan*, P. Nune**
*Senior Medical Officer, TDR; **Physician, TDR.
*Tuberculosis Disease Hospital, MARRONI, KENYA
OBJECTIVE: To determine the seroprevalence of HIV in TB patients. **METHOD:** To compare the features of TB in seropositive and seronegative patients. **RESULTS:** From July to December 1988, all patients diagnosed as TB in the Harare City TB Unit were studied. Full clinical assessment and HIV testing using ELISA, in some cases confirmed by Western Blot, was performed. **RESULTS:** 195 clinical TB diagnoses were confirmed. 100 (51%) were seropositive, 195 diagnosed clinically. HIV serology was obtained on 403 (90%).

Th.6.0.7 "Reliability and Validity Issues in the Assessment of Sexual Behavior."

Catania, Joseph A., Ph.D.
University of California, San Francisco
San Francisco, California, USA

An unprecedented number of human sexuality studies have been initiated in response to the AIDS epidemic. Unfortunately, methodological developments in the field of sex research have been slow in meeting the demands of AIDS investigations focusing on the diverse populations at risk for HIV (e.g., adolescents, gay men, IV-drug users, ethnic minorities, elderly transsexuals). This paper reviews and integrates literature on research bias in sex research. The relevance of past methodological findings for AIDS behavioral research is discussed and recommendations are made to guide future investigations on sexual behavior in the area of AIDS.

Lusaka/Lira, Nkomoji, Kinshasa, Zaire

Th.6.0.9 SEXUALITY RESEARCH CONCERNING STD AND AIDS IN THAILAND

Veraval Kilivilai, Jean Barry
Chulalongkorn University, Bangkok, Thailand

Object: To examine status of research on sexuality concerning sexually transmitted diseases and AIDS in Thailand and recommended areas of research needs.

Method: Compilation of bibliography. Review of available literature and existing data.

Results: Systematic research on human sexuality in Thailand was primarily carried out during the past two decades. Most of earlier research was done in relation to contraceptives and birth control. Later, clinical STD research and research on premarital sex of adolescents received most attention. Research efforts have covered areas: sexual behaviours, marriage, sex education, knowledge, attitude and beliefs concerning sex and sexual health. Inquiry of EAP among adolescents on sexual experience and STD is rather thorough, however, among adults is limited and fragmented.

Conclusion: Research in Thailand covers vast areas but not uniformly. Needed are psychosocial studies on sexuality including description of sexual behaviour and cultural traditions among various groups of the total population.

Th.6.0.10 SEXUALITY RESEARCH IN BRAZIL PineJ. Arletty*

*Centro de Referência e Treinamento-AIDS, São Paulo Brazil

Brazil is usually associated to Carnival (Mardi-Gras), music, Latin lovers and half-naked "mulatas" that crowd the beaches in Copacabana. But the true Brazil is more than the apparent sexual permissiveness of less than 10% of the population, its size, as well as its economic situation and mixed racial and cultural origins, being about a unique and complex country of fascinating contrasts. "Active" and "passive" sexual behavior have a greater significance in the general population than the concepts of heterosexuality, bisexuality and homosexuality. Sex plays an important role in the Afro-Brazilian cults that are widely practiced by Brazilians. Women are expected to be submissive to men. Transvestite prostitution is an important form of prostitution. Homosexuality is still considered a form of disease or a sin. Sex can be practiced for procreation, recreation or survival. Research in sexuality has to have the flexibility to distinguish the difference between sexual and sensuous behavior which, in Brazil, have distinct meanings.

Th.6.0.11 RESEARCH ON HUMAN SEXUALITY IN AN AFRICAN AFRICA Adrian Lawrence A.*

*WHO Programme on AIDS, WHO, Geneva, Switzerland

Objective: The presentation provides a sociocultural framework within which African sexuality and the risk of HIV infection can be investigated.

Method: Ethnographic materials and some preliminary findings from WHO-supported national. However, serological instability expresses the reproductive sexual network to the wider recreational network. The concepts of beauty, crime and sexual obligations are passed on from one generation to another within the framework of puberty rites and at fertility-related festivals. Sexuality in old age is influenced by the socio-economic independence of both sexes at the end of the female reproductive cycle and tends to involve younger persons. Education, migration and urbanisation erode traditional sexual norms. Clustering of young adults, mostly males, in urban centres and on plantations produces a compensatory inflow of females who provide them with a range of domestic, commercial and sexual services on a regular or ad hoc basis. Implications for HIV transmission are stressed.

Conclusion: A systematic research agenda is needed to increase our understanding of the social dynamics of heterosexual transmission and control of HIV/AIDS in Africa.

Th. G.O.25 PROSPECTIVE STUDIES ON HIV INFECTION OF PROSTITUTES IN THE PHILIPPINES
Hayes, Corina¹; Maelonio, C.²; Padre, L.³; Basaca-Sevilla, V.⁴; Andrada, A.⁵; Tzipora, G.⁶; et al.
¹U.S. Naval Medical Research Unit #2, Manila; ²Ugillipino Department of Health, Manila; and ³The City Health Office, Cilegong, Republic of the Philippines.

Objective. Describe the epidemiology of new HIV infections occurring in prostitutes over a 4-year period.

Methods. Hospitality girls working in bars and night clubs frequently engage in prostitution in the Philippines. We have prospectively sampled populations of these women in several towns to determine HIV incidence based on seroconversions. In addition, other women who entered the study populations and started working between bleeding intervals were tested. HIV positive women have been interviewed and examined clinically at 1-month intervals to verify their diagnosis.

Results. HIV seroconversions have been documented in 14 of 12,615 prostitutes for an incidence rate of 0.9/1000 person years. An additional 12 HIV positives were detected among 25,673 women who entered the target population between bleedings. The number of new HIV positives detected each year appears to be decreasing. Only minor signs and symptoms that are probably HIV related have been detected after an average follow-up of 17 months.

Conclusion. This study documents a low rate of HIV spread among the prostitute populations sampled. Based on interview data, this may be attributable to certain sexual behavior characteristics and to the absence of IV drug use.

Th. G.O.27 MALE CIRCUMCISION IN EASTERN AND SOUTHERN AFRICA: ASSOCIATION WITH HIV SEROPREVALENCE

Tomar, Barbara¹; Plummer, F.A.²; Nwadi, A.K.³; Nwawo-Nwala, J.O.⁴.
¹International Development Research Centre, Nairobi, Kenya; ²University of Nairobi, Nairobi, Kenya; ³University of Nairobi, Nairobi, Kenya; ⁴University of Nairobi, Nairobi, Kenya.

OBJECTIVE. To investigate the association between male circumcision and the geographical pattern of HIV infection in eastern and southern Africa.

DESIGN. Several cross-sectional and prospective studies have shown uncircumcised men to be at higher risk of HIV infection compared to circumcised men. We searched an entomological data base to ascertain the practice of male circumcision among major ethnic groups in eastern and southern Africa and reviewed population-based HIV seroprevalence data.

RESULTS. Approximately 12% of the male population in Kenya (2 major ethnic groups/20) is uncircumcised, as compared to 60% in Tanzania (13/29), 60% in Zambia (17/29), 90% in Uganda (12/13), and 90% in Zimbabwe (18/19). A preliminary review of published and unpublished data yielded population-based HIV seroprevalence data from over 30 areas in the region, which were divided into low, moderate and high HIV prevalence. Ethnic groups in high and moderate prevalence areas were more likely to be uncircumcised compared to those groups in low prevalence areas.

CONCLUSIONS. Preliminary findings suggest that the geographical patterns of HIV seroprevalence are consistent with the hypothesis that uncircumcised men are at higher risk of acquiring HIV infection. Further studies examining the relationship between male circumcision and the risk of acquiring HIV infection are recommended.

Th. G.O.29 CONDOM USE AND KNOWLEDGE IN GENERAL POPULATION, FEMALE PROSTITUTES AND GAY AND BISEXUAL MEN

Itzaja, J.A.¹; Prada, L.¹; Valdesolo, J.¹; Sepulveda, J.¹

¹Department of Epidemiology, Ministry of Health, Mexico

Objective. To compare knowledge and use of condom in general population, prostitutes and homo and bisexual men.

Methods. A survey was done in 6 cities in Mexico during May, 1988. A questionnaire was applied individually to general population (n=101), female prostitutes (n=78) and homo and bisexual men (n=78); a condom was shown to investigate visual recognition and condom use practices.

	Knowledge and use of condom.			Frequency of use of condom			
	Known	Used last m.	Used last 6m.	Always	Half of the time	Never	
Gen.pop.	78%	6%	10%	Gen. pop.	5%	5%	90%
Home.	86%	29%	43%	Home.	29%	14%	57%
Prost.	94%	82%	89%	Prost.	38%	20%	42%

A significant difference existed between every group. The use of condom is less frequent in gay men than in prostitutes although that knowledge is similar. The use of condom is more frequent in gay men than in general population which is explained by their risky practices.

Th. G.O.26 STATUT SEROLOGIQUE D'UNE POPULATION DE PROSTITUES EXCUBAÏENNES EXPOSÉES AUX HIV ET HIV2 AU BURKINA FASO

Sangaré, Lyman¹; Kanki, P.²; Soudré, R.³; Tiendrébogo, H.⁴; M'Boop, S. ⁵; Ezzou, A.⁶; et al.

¹Hopital A. Le Dantec, Dakar, Sénégal; ²Hopital Yağudo Ouedogo, Ouagadougou, Burkina Faso; ³Hopital School of Public Health, Boston, Massachusetts, États-Unis.

Objectif. Déterminer l'évolution de la séroprévalence dans une population de prostituées doublement exposées à HIV1 et HIV2.

Méthode. En 1986, une première étude séroépidémiologique a permis de rechercher par Western blot et RPA, la présence d'Ac anti-HIV1 et anti-HIV2 dans 303 sérum de prostituées.

En 1987, une étude similaire a porté sur 261 sérum de prostituées. Parmi celles-ci, certaines de la première enquête ont été retrouvées.

Résultats. Les séroprévalences rapportées ont été respectivement de:
Année Total exam. HIV1 HIV2
1986 308 8.8% 14.6% 5.8%
1987 268 14.9% 5.6% 4.8%

Parmi les prostituées réexaminées lors de la seconde enquête (N=14), nous avons observé 35% de séroconversion avec 21.4% pour le HIV1 et 14.3% pour le HIV2. Par ailleurs, dans ce même groupe nous avons noté l'apparition de double profil chez 7.0% des prostituées enregistrement indiquées par le HIV2.

Conclusion. Ces différents résultats montrent une importante circulation du HIV1 qui tend à se substituer au HIV2. La poursuite de ce travail permettra de préciser les conditions de reverses des cas de double infection à HIV1 et HIV2.

Th. G.O.28 FACTORS ASSOCIATED WITH PREVALENT HIV-1 INFECTION IN FREGUENT WOMEN IN MALAYSIA

Chaiyapong J., Miové E., Dalabatta G., Niotti P., Lioha N., Alfred J., Shah

¹Queen Elizabeth Central Hospital, Singapore, Malawi; and ²Johns Hopkins School of Hygiene and Public Health, Baltimore, MD, USA.

Objective. To determine factors associated with prevalent HIV-1 infection in frequent women in Malawi.

Methods. 247 consecutive women who presented to the antenatal clinic at the QCH during December 1988 were tested for HIV-1 antibody and had their charts reviewed. Antisero testing was done by ELISA with Western blot confirmation. Informed consent was obtained from each participant. Variables that were analyzed included age, trimester at presentation, gravidity, occupation, VWS, history of TB, STD, transfusions, spontaneous abortion, still birth, prematurity, and neonatal death.

Results. 48 of the 247 (19%) women were seropositive for HIV-1. Reactive VWS was significantly associated with HIV-1 seropositive status (OR = 18, p=0.02). 37 of the 104 women who had had prior pregnancies were HIV-1 seropositive. History of spontaneous abortion in this group was of borderline significance (OR = 14, p=0.06). None of the other variables was significantly associated with HIV-1 infection.

Conclusions. This cross-sectional analysis shows that reactive VWS should raise one's index of suspicion regarding HIV-1 seroreactivity. Also, HIV-1 infection may play a role in fetal wastage.

Th. G.O.30 COMPARISON BETWEEN RISK PRACTICES IN FEMALE PROSTITUTES AND GAY AND BISEXUAL MEN

Itzaja, J.A.¹; Prada, L.¹; Valdesolo, J.¹; Sepulveda, J.¹

¹Department of Epidemiology, Ministry of Health, Mexico

Objective. To determine the prevalence of risky sexual practices in female prostitutes and gay and bisexual men in Mexico.

Methods. A survey was done in Guadalajara, Tijuana, Monterrey, Acapulco, Mérida, and Mexico City in May, 1988. A questionnaire was applied individually to female prostitutes and gay and bisexual men, investigating the frequency of risky sexual practices.

Results.

Sexual practices	Prostitutes		Gay and bisexual men	
	Always	Half of the time	Always	Half of the time
1	81%	1%	4	18%
2	0.6%	0.5%	7%	17%
3	2%	0%	20%	12%
4	16%	16%	22%	12%

Frequency of sexual contact in prostitutes was: vaginal: 80% always, 15% half of the time, 5% never; anal: 30% always, 1% half of the time, 4% never; oral: 32% in gay and bisexual men, frequency of same deposit was: insertive: 49% always, 12% half of the time, 30% never; receptive: 42% always, 18% half of the time and 37% never; oral: receptive: 9% always, 95% half of the time, and 3% never.

Conclusions. Although HIV prevalence in gay and bisexual men ranges from 2% to 30% and is less than 1% in prostitutes, the high levels of risk in sexual practices stress on the need of strengthening educative efforts directed to these groups.

Th.G.O.43 EPIDEMIOLOGY OF AIDS IN THE BAHAMAS 1982-1989

Olofin-Barko Kumbeth, Aymee F. Bain R, Miller M.L., Gomez F, Ministry of Health, Nassau Bahamas.

OBJECTIVE To describe the AIDS epidemic in The Bahamas during the period August 1985 - March 1989.

METHOD Information from notifications of AIDS patients and contact tracing HIV testing and blood donor screening were analyzed.

RESULTS Three hundred and eight cases of AIDS were reported over a period of 44 months. The incidence rate per 100,000 rose from 16 in 1985 to 38 in 1988. Ten of the 24 inhabited islands have been affected. Fifty-five (17.8%) cases occurred in children. The proportion of cases due to perinatal transmission has varied from 27.7% in 1985 to 7.7% in 1989. Heterosexual transmission accounts for 59% of cases, homosexual 21, bisexual 8%. Among the adults 34% were free born, 66% were contact partners. The fatality rate is 30.6%. The number of HIV infected individuals identified has increased from 20 in 1985 to 419 in 1989 with a cumulative total of 310. Of the 10,369 units of blood screened during this period, 48 (0.46%) were found to be positive for HIV infection.

CONCLUSION There has been a rapid increase of AIDS and HIV infection in The Bahamas. The proportion due to perinatal transmission though high, has shown a significant decrease. The predominant mode of transmission is heterosexual. Cocaine abuse has contributed to the spread of HIV infection.

Th.G.O.45 SITUATION EPIDEMIOLOGIQUE DU SIDA EN GUYANE FRANÇAISE - DE VIENNE - F.D.A.S.S. de Guyane - Médecin Inspecteur de Santé.

avec la collaboration des membres du Comité SIDA Guyane.

131 cas de SIDA ont été recensés entre 1987 et 1988 dans une population estimée à environ 100.000 habitants.

Dans ce département français la transmission hétérosexuelle du VIH est prédominante.

14 cas pédiatriques cumulés montrent la transmission materno foetale correspondant à plus de 10% des patients atteints du SIDA.

Les infections opportunistes sont majoritairement dans les manifestations cliniques aigus que le syndrome de l'homme à l'été recensé que chez deux patients.

94 de ces malades sont à ce jour décédés.

HAITI

Timothee, Gabriel. CARE PWR Haiti, Port-au-Prince

Haiti.

Th.G.O.47 AIDS EDUCATIONAL STRATEGIES AND ETHNIC DIVERSITY IN SURINAME del Prado, Ruben F.

*"National AIDS Program" of the Bureau of Public Health,
Paramaribo, Suriname, Sur. Am.*

In the 18th century, Suriname (then also known as Dutch Guiana) had a prosperous plantation economy, based on the labour of African slaves. To counteract the manpower shortage after the abolition of slavery in 1843, the immigration of indentured labourers from British India began in 1873, followed by a similar movement of Javanese from the Dutch East Indies. The multi-ethnic, multi-cultural, multi-religious, multi-lingual society which now comprises the Republic of Suriname has no clear manifestations for any health education program. The official language is Dutch, but Surinamese Hindustani, Javanese, Chinese, several Amerindian and Bushinagro (Wayana) languages, and a vernacular comparable to Creole, Surinamese, are widely spoken. None so far as to other Caribbean countries the official language is only "official" in the true sense of the word. Although AIDS education faces the usual dilemma as anywhere in the world, we meet this extra challenge of racial ethnic diversity in a nation without a common tie. The first classified case of HIV infection dates back to 1982, and Suriname has since seen 36 people with clinical HIV infection (AIDS) out of a total of 41 known to be HIV infected. Though we do not have an approximation of the total number of HIV infected in Suriname, we believe that the number of clinical cases is as close to reality as possible, with an estimated 400,000 inhabitants, Suriname lags behind its neighbouring countries in regard to the number of people with AIDS. It is a dismal thought, but we may only be lagging behind the wave of a substantial outbreak of HIV related diseases. A delay which we may (hypothetically) attribute, in part, to our special socio-demographic make-up. HIV specific norms concerning human sexuality. But these very same cultural norms, in their diversity, could very well impede our AIDS education efforts.

Th.G.O.48 CHALLENGES IN DEALING WITH THE AIDS EPIDEMIC IN JEREMO WHY? WHO Muhlestein

Minister of Health, National AIDS Program, Republic of Trinidad and Tobago

Objective: To discuss the socio-cultural factors influencing programme activities as we

respond to the AIDS epidemic in Trinidad and Tobago.

Method: A case study will be based on the current reports of the Ministry

of Health. (Annual reports will be based on the minimum data of reported cases among

health workers, transmission of HIV has been identified as the main mode of spread, as seen

in clinical trials of 39 cases of AIDS over period 1983 - October 1989 (prevalence 20.7%,

homosexual 34.9% and bisexual 30.2%). Blood screening for HIV was initiated in 1985.

A national appointed National AIDS Committee was established in 1987. Efforts to control

AIDS are channelled through public education, training of health care workers,

community and social support services and community participation. One of the major

challenges appear to be the need for focused, sustained interest and willingness to address

the problem of HIV infection/AIDS in the real context of social and economic power and

authority, at community and institutional levels. To the extent and time we are engaged in

program to provide of services or treatment at institutional level for persons with AIDS,

we must be prepared to identify and manage persons for HIV testing for the world will

depend on us to reduce the problem. There is need to increase the cadre of personnel

who address the behavior change or provide counsel and support for clients and families.

Conclusion: Although the AIDS Control Programme has been implemented in Trinidad and Tobago

since 1987, there are some serious concerns which must be addressed, both at individual,

community and institutional levels.

M.G.P.13 STUDY OF HIV-1, HIV-2, AND HTLV-I IN FEMALE PROSTITUTES IN BRAZIL
 Correa, Eduardo,*; Datta, R.***; Sisson, D.***; Aboulafia, D.***; Li, X.L.***; and Ho, D.P.*** School of Medicine, Federal University of Rio de Janeiro, Rio de Janeiro, Brazil; University of California at Los Angeles (UCLA), Los Angeles, California, U.S.A. **Cedars-Sinai Medical Center, Los Angeles, California, U.S.A.

Objective: To investigate human retroviruses, seroprevalence, and transmission patterns in female prostitutes in Brazil.
Methods: A total of 187 prostitutes were studied in 2 states: 101 in Brehim in Rio de Janeiro (34 females [LCP], 77 middle- [MCP], and 47 upper-class prostitutes [UCP]) and 86 prostitutes in Brehim and other brothels in rural areas (RAP). Sera and a questionnaire with information on demographics and practices associated with AIDS were obtained. HIV-1, HIV-2, and HTLV-I were tested by ELISA, immunoblot and radioimmunoprecipitation assay.
Results: HIV-1 was found only in LCP in Rio (9%). HIV-2 was not found. HTLV-I was found in MCP (4%) and LCP (8%) in Rio, and in RAP (1%). Less than 20% of prostitutes used IV drug use; none of HIV infected LCP were IV drug users. Illiteracy was noticed in 20% of LCP, but none in UCP. Median number of different partners/week was 20 for MCP and MCP, 48 for UCP, and 10 for RAP. Linear analysis identified significance in several variables studied.
Conclusion: HIV-1 was prevalent only in LCP. IV drug use was not a significant pattern of HIV transmission in prostitutes in Brazil. HTLV-I is present also in rural areas in Brazil.

M.G.P.14 SEROPREVALENCE OF HIV-1, HIV-2, AND HTLV-I IN BRAZILIAN BIRURAL RALES
 Correa, Eduardo,*; Datta, R.***; Sisson, D.***; Aboulafia, D.***; Li, X.L.***; and Ho, D.P.*** School of Medicine, Federal University of Rio de Janeiro, Brazil; **University of California at Los Angeles (UCLA), U.S.A. ***Cedars Sinai Medical Center, Los Angeles, California, U.S.A.

Objective: To study the seroprevalence of HIV-1, HIV-2, and HTLV-I in birural areas from Rio de Janeiro, and their role in the retroviral transmission to the heterosexual community in Brazil.
Methods: Fifty eight birural males, recruited in gay bars and clubs were interviewed for demographic information and practices related to retroviral transmission. Sera were tested for antibodies against HIV-1, HIV-2, and HTLV-I by ELISA, and confirmed by immunoblots and radioimmunoprecipitation assays.
Results: One female was 20% for HIV-1 and 7% for HIV-2 and confirmed by immunoblots and radioimmunoprecipitation assays. Median number of partners/month was 19 (prostitutes) and 4 (non prostitutes). 50% of the sexual partners were men and 50% women. current IV drug use was reported. Multivariate analysis of different variables, was done using log linear models.
Conclusion: The studied birural males have a high HIV-1 and HTLV-I seroprevalence, and may be an important bridge for HIV infection between the homosexual and heterosexual communities in Brazil.

M.G.P.15 SEROPREVALENCE OF HIV-1 IN EMERGENCY ROOM PATIENTS IN BRAZIL
 Correa, Eduardo,*; Lourenco, R.***; Lima, R.***; Huang L.***; Viana, R.***; Nogueira, C.*** School of Medicine, Federal University of Rio de Janeiro (UFRJ), Brazil; **UFRJ Hospital, Rio de Janeiro, Brazil.

Objective: To study seroprevalence and routes of HIV-1 transmission in emergency room patients.
Methods: 103 patients were recruited in the adult emergency room of the UFRJ Hospital. Information on demographics and practices related to HIV transmission was obtained by a questionnaire. HIV-1 antibodies were tested by ELISA and confirmed by immunoblot.
Results: Fifty one percent of participants were male (50) and 49% female (53); they were white (52%), black (23%) and mixed(25%); median age was years 45.5 for M and 33.1 for F. 20% had blood transfusions, 87% were heterosexual; median number of partners/month was 1.60 and 1.19; 22% of M had contact with prostitutes in the past 10 years. Sexually transmitted diseases were seen in 38% M and 12% F. 90% of sexually active single people (M/F) used condoms. Three (2%) subjects, 2 M and 1 F, had antibodies to HIV-1. All were heterosexual, without contact with HIV infected individuals, IV drug use, or blood transfusions. Significance of the variables collected was determined by log linear models.
Conclusion: HIV-1 is reaching non risk population for AIDS in Brazil. Preventive measures to avoid HIV infection are not widely used by the population studied.

M.G.P.16 HIV-2 INFECTION IN PRENATAL WOMEN IN GUINEA-BISSAU
 Andersson, Per-Ake; Dias, F. J.; Teixeira Goudaby, J. M.; Nacur, A.***; Biserfeld, G.***. Laboratório Nacional de Saúde Pública, Guinea-Bissau and National Microbiological Laboratory, Stockholm, Sweden.

Objective: To determine the prevalence of HIV-2 infection among antenatal women in various regions of Guinea Bissau and the route of vertical transmission of the infection.
Methods: Sera from prenatal women in the capital Bissau and in 5 regional capitals and sera from children of seropositive mothers were tested by HIV-2G6699 ELISA. Positive sera were confirmed by Western blot.
Results: 6.9% of 1992 women in Bissau were HIV-2 seropositive. The HIV-2 seroprevalence ranged from 3.1 to 13.2% among women from various parts of the city. The seropositivity rate increased with age from 2.5% in women less than 17 years old to 13.4% in women older than 33 years. In the 5 regional capitals the seropositivity rates were 2.1% (5/237), 3.6% (9/253), 7.0 (18/258), 3.4% (5/145) and 3.6% (7/195). All of 9 children of seropositive mothers followed up for more than 12 months after birth were seronegative.
Conclusion: The seropositivity rate among prenatal women varied considerably between different parts of the capital and between different regions. Follow-up of additional children which is in progress will allow conclusions about the vertical transmission rate.

M.G.P.17 CHILEAN NATIONAL HIV LABORATORY NETWORK
 Sanchez, D., Muñoz, G., Vera, L., Soto, O. National Public Health Institute, Santiago, Chile

Objective: To establish the usefulness of a national laboratory network on HIV diagnosis and to show results obtained at the national HIV reference center.
Methods: A questionnaire was sent and according to its results, laboratories were classified in different levels, depending on their implementation. Training and resources were provided to the laboratories.
Results: Only one national HIV reference center was established and all doubtful or positive specimens must be sent for confirmation.
Conclusion: The network is composed of 46 public and 23 private blood bank and laboratories in which HIV antibodies detection is performed with a monthly average of 20,000 blood donors.
Conclusion: This national laboratory network allows proficiency laboratory evaluation and sets a base of limited resources, securing an acceptable quality standard diagnosis.

M.G.P.18 HIV-1 SEROPREVALENCE IN RURAL FAIR
 Hanco, Jala J.; Green, S. J.; Cutting, M.*** and Crawford, M.***. Univ. of Edinburgh, Edinburgh, Scotland, **Institute Medical, Evangelische, Klempe, Zurich.

Objective: To determine the seroprevalence of HIV-1 in a rural area, in Fair.
Methods: As part of an ongoing perinatal study, based at a rural reference hospital 220 km s.w. of Kinshasa, 1485 pregnant women were screened for antibodies to HIV-1. Screening was by Abbott Recombinant HIV-1 EIA, confirmed by Molecogen HIV Monoclonal VII 52/55 ELSIA. 1000 blood donors were screened with the Cambridge Bioscience Latex Agglutination (IA) test, with EIA confirmation.
Results - Pregnant women: 46/1485 (3.2%) HIV-1 antibody positive (HIV+). If women from distant large towns are excluded there were 41/1422 (2.9%) HIV+. Age varied from 14 to 48 years, with mean 26 yrs for both HIV+ and HIV- women. HIV- women were more often monogamously married; HIV+ women, single (p<0.01). Mean parity (3) was the same for both groups. Educational level of both HIV+ women and their partners was higher (p<0.025, p<0.1 respectively). Women who were partners of chauffeurs or small business-owners were twice as likely to be seropositive. Blood donors: 55 positive by IA, 21/1000 (2.1%) confirmed HIV+ with ELSIA. The false positive rate for the latex test was 1.6% (n=61).
Conclusion: The prevalence of HIV-1 infection in two asymptomatic adult groups in this rural area of Fair is 2.9% of pregnant women and 2.1% of blood donors.

Th.G.P.1 HIV AND HTLV-I INFECTION AMONG HOMOSEXUAL AND BISEXUAL MEN IN KINGSTON, JAMAICA
 Murphy, Edward L.; Gibbs, W.H.M.; Figueroa, J.P.; Bain, R.; LaGrande, L.; Cranston, B.; and Blattner, W.A.P.
 *National Cancer Institute, Bethesda, MD; *Univ. of the W. Indies, Kingston, Jamaica; **Min. of Health, Kingston, Jamaica

Objective: To evaluate prevalence and risk factors for infection with HIV and HTLV-I in Jamaican homosexual men.
Methods: From 8/85 through 1/86, 125 homosexual or bisexual men had ELISA/Western blot for HIV/HTLV-I and questionnaire data.
Results: 15 men (12%) were seropositive for HIV and 6 (5%) for HTLV-I; one man had possible co-infection with HIV and HTLV-I. Sexual contact with men in the U.S.A. was common, and was weakly associated with HIV infection (p=0.11). The median number of homosexual partners was 12 per year (range 0-135) and a greater number of partners per year was associated with HIV seropositivity (p<0.01). Lymphadenopathy was identified in several HIV seropositives. For HTLV-I there were no obvious risk factors identified, and age-adjusted seroprevalence was not significantly higher than that of heterosexual men.
Conclusions: HIV appears to have entered this population via sexual contact with foreign men and spread efficiently among men with a greater number of sexual partners. The frequency of bisexuality (65/125 men) and the 11% HIV prevalence in bisexual men suggest that secondary infection of female sexual partners may occur.

Th.G.P.3 HIV INFECTION AMONG PROSTITUTES AND TRANSEXUITES IN BRAZIL
 80k., FRANCISCO, Hideo, Liza, J. N.; Abreu, U. B. S.; Monteiro, D. T.; Pavan, M. H. P.; Pedro, R. J. et al.
 UNICAMP, Campinas, Sao Paulo, Brazil.

During 1988 HIV testing was done among prostitutes and transvestites who spontaneously reported to a health clinic located in the prostitution area in Campinas, southeastern Brazil. Tests were performed using the ELISA (recombinant DNA) antibody assay and Western-Blot (WB) antibody assay. One hundred and two individuals were tested: 218 were male and 79% female. The age ranged from 14 to 56 years but 61% were 20 to 29 years old. Most (78%) were prostitutes, 19% male homosexuals and 3% male bisexuals. Among the prostitutes 15% reported IV drug use. The first 48 individuals were tested by ELISA (2 samples) and WB; 35.7% had antibodies by both methods and 64.3% did not have antibodies by both methods, showing a sensitivity and predictive value of 100% for the ELISA test when compared to the WB test in this high risk population. The 48 remaining patients were tested only through ELISA. The overall prevalence of HIV antibody positive individuals in the population studied was 21.5%.

Th.G.P.5 PREVENTIVE INTERVENTION FOR HIV IN STD CLINICS IN ZAMBIA.
 Nerva, Subhashi; Matsuda, J.*
 *University Teaching Hospital, Lusaka, Zambia.

Zambia is the only sub-Saharan African nation with a STD control programme. It was launched in 1980 and expanded to include a network of STD clinics providing standardized treatment, contact tracing, counselling and surveillance. The male:female attendance ratio has improved from 3:1 in 1980 to 2:1 in 1987. The programme in screening and treatment programme introduced in 1984 has reduced seroprevalence of syphilis in pregnant women in Lusaka from 11.8% in 1983 to 6.0% in 1987. With high seroprevalence of HIV among STD attendees, it is simple, easily accessible target population where health education, counselling and condom promotion can be highly successful in reducing HIV transmission.
Conclusion: Other nations based on this model programme to establish similar programmes and introduce preventive intervention for HIV.

Th.G.P.2 RISK FACTORS FOR HTLV-I INFECTION IN PREGNANT HAITIAN WOMEN
 Buff, Andria*; Hot, E.*; Wiktor, S**; Boulos, R***; Battner, W**;

Jesey, M, et al.
 *Johns Hopkins University, Baltimore, MD; **National Cancer Institute, Bethesda, MD; ***Centers for Health and Development, Port-au-Prince, Haiti

Objective: To identify factors associated with HTLV-I infections in pregnant Haitian women.
Methods: Pregnant Haitian women were screened for HTLV-I, (ELISA and WB) HIV-1, and syphilis.
Results: Of 2070 women, 894 (43%) were seropositive for HTLV-I. Seroprevalence rates increased with age from 2.3% in women 14-19 years old to 8.4% in women over 24 years old. Regression analysis revealed independent associations with alcohol consumption (OR = 5.2, 95%CI = 1.23, 22), HIV-1 seropositivity (OR = 3.7, 95% CI = 2.1, 6.8), smoking (OR = 2.1, 95%CI = 1.0, 4.2), and age > 34 years (OR = 2.0, 95% CI = 1.1, 3.9). HTLV-I seropositivity did not differ from seronegative women in marital, educational, or socioeconomic status, syphilis serology or prior use of family planning. Other potential risk factors, IV drug use and transfusions, are not prevalent in this population.
Conclusion: The increasing seroprevalence rates with age and the association with HIV-1 seropositivity suggest that HTLV-I is transmitted through sexual contact in this population. As our studies of HIV-1 risk factors also demonstrated, an association exists between seropositivity and smoking. We have undertaken additional studies in this population to determine the basis of this association.

Th.G.P.4 MERCHANT SEAMEN: A RISK POPULATION FOR HIV INFECTION?
 Corralo, Malcom; Jerez, R. and Gasanovic, D.
 University of Valparaiso, Valparaiso, Chile.

In Valparaiso (principal port of Chile) 3/90 HIV infected people had been heterosexual merchant seamen, 2 of them had transmitted the infection to their wives.

Objective: To determine if merchant seamen could be a risk group for HIV infection and a factor in the propagation to the female population in Chile.
Methods: After informed consent was obtained a questionnaire was administered to 452 healthy seamen with at least 1 year of international travels. Simultaneously blood was drawn for HIV Ab and HIV Ag determination (Organon).
Results: The mean age was 36.7 years, 70.9% had medium or high level social literacy. In the last five years, 64.6% had frequently travelled abroad. During this period 7.3% had undergone surgical procedures, 1.3% had received blood transfusion, 35.2% injections, and 31.0% tattoos. 100% of the subjects declared heterosexual, 70.3% were married, 65.6% admitted multiple sexual intercourse predominantly with prostitutes of South America (Ecuador, Peru, Brazil) and Europe (UK, FRG) and 22.3% other S.A. Only 3.5% used condoms. Marital status and education were not significantly associated with risk sexual behaviour and use of condoms. HIV antibody and HIV antigen were not detected in 442 and 249 serum samples tested.
Conclusion: HIV infection was not demonstrated in this study, however, the high frequency of sexual contact with different foreign prostitutes may be a risk factor for this group and their female partners in Chile.

Facteurs de risque liés aux MTS (partie 2) STD Risk Factors (Part 2)

Th.G.P.6 DETECTION OF HIV-1 FROM FILTER PAPER BY PCR
 PCR-VALENCE CHAIN REACTION (PCR-VALENCE)
 Stanton, Craig; Kotler, B.; Malher, R.; Kiani, P.; Essex, M.
 Harvard School of Public Health, Harvard University, Boston, USA.

Objective: To determine the suitability of collecting whole blood specimens on filter paper for HIV-1 DNA detection by PCR.
 Dried blood on HIV-1 seropositive mothers may carry and HIV-1 antibodies which may have been transferred across placenta.
 At present, one must either HIV by co-cultivation or demonstrate viral DNA to determine the actual infection of the newborn. PCR is a newly developed method which enables detection of a minute amount of DNA.
Methods: Blood from known HIV-1 seropositive patients and known controls was collected by heparin spotting Whatman #3 filter paper, approximately 1 cm in diameter. The papers were kept in plastic bags at room temperature for 4-6 weeks. DNA was extracted by digestion with SDS and proteinase K followed by phenol-chloroform extraction and ethanol precipitation. Papers were resuspended in 100 µl TE buffer. 2.5 µl of the DNA suspension was then used for DNA amplification by PCR. PCR was performed using HIV-1 specific primers for the gag, env, and LTR regions. The PCR product was dot-blotted and hybridized with pCR labelled probes of these three regions. Results were compared to HIV-1 DNA isolated from rectal tissue cultures.
Results: We performed PCR amplification of DNA extracted from whole blood collected on filter paper from HIV-1 seropositive patients. Using this technique we have been able to detect the presence of HIV-1 DNA in many quantities of blood.
Conclusion: Detection of HIV-1 by PCR, from whole blood collected on filter paper can be performed effectively. The method can facilitate diagnosis of HIV-1 in situations where (1) storage of blood may be logistically difficult, ie. in developing countries, and/or (2) when amount of blood available is very small, i.e. in newborns.

W.G.P.25

MALE SEROPREVALENCE AND AIDR. PRESENT STATUS AND PERSPECTIVES IN MEXICO

Dávalos M.C., Barasa J.M., Velázquez A.T., Magas C., Ornelas O.

Univ. de Guadalajara, Jalisco, Mexico; Univ. de México, Mexico

Objective: To define sexual practices and HIV infection prevalence in bisexual men who attend an HIV detection center in Mexico City. **Methods:** A survey which included HIV test was done in 1978 homosexual and bisexual men who attended an HIV detection center in Mexico City from January to December, 1988. **Results:** 740 men (44%) declared having had sexual relations exclusively with men (0, 945 (28%) with men and women (80) 84% of homosexual men had at least one sexual partner during the last 6 months (M4), 813 (96%) of bisexual men had at least one sexual partner during the last 6 months (M4), of these, 373 (46%) had only male sexual partners during the last six months (M4), 116 (14%) had only female sexual partners during the last 6 months (M4) and 355 (46%) had both male and female sexual partners during the last 6 months (M4). The HIV prevalence was as follows: 10, 20% (M4), 27%, 10% (M4), 20%, 10% (M4), 20%, 10% (M4). Seroprevalence was 21%, 9% of seropositive subjects were in clinical stage I, 12% were in II, none in III. HIV infection was serotyped in 49% of seropositive subjects. The percentage of stable heterosexual partner was 6% (M4) to 47% (M4), and 60% with women. Frequency of stable heterosexual partner was most frequent in Stage I (20%), Stage II (18%), Stage III (18%), and Stage IV (18%). Positive test results (M4) were associated with HIV infection in all groups. **Conclusions:** Heterosexual and bisexual men attending counseling sessions that in other cultures and has modified the epidemiological pattern of HIV infection. Results show that bisexual practices are frequent, risk practices associated to HIV seropositivity are similar to the ones described in heterosexual. While heterosexual practices constitute protective factors for bisexual men, they represent a risk of transmission to their heterosexual partners.

W.G.P.26

HTLV-1 SEROPREVALENCE INCREASED AMONG THOSE LIVING AT LOW ALTITUDE IN JAMAICA

Murphy, Edward J., Maloney, E., Figueroa, J.P., Gibbs, W.W.,

Univ. of Kingston, Jamaica; Univ. of Cranston, R.I.; Blair, W.A., National Cancer Institute, Bethesda, MD, Univ. of Health, Kingston, Jamaica, **Univ. of the W. Indies, Kingston, Jamaica.

Objective: To determine demographic and geographic determinants of Human T-lymphotropic virus Type I (HTLV-1) seroprevalence in Jamaica, an endemic island. **Methods:** During 1985 and 1986, we measured HTLV-1 antibodies using ELISA and Western blot in 13,000 Jamaican workers. **Results:** HTLV-1 seroprevalence was strongly age- and sex-dependent, rising from 1.8% (ages 10-13) to 5.0% (ages over 70) in men and from 2.0% (ages 10-13) to 10.4% (ages over 70) in women. Women were more likely to be seropositive than men (adjusted odds ratio = 2.23). Black men had marginally higher HTLV-1 seroprevalence (M-H chi square = 0.06), but black women had equivalent prevalence to women of other races. Current residence at altitudes of less than 1000 feet (p = .003) and birthplace outside of the Kingston metropolitan area (when only p = .001) were significant risk factors for HTLV-1 seropositivity, after stratification by age and gender. **CONCLUSION:** Older age, female gender, and black race are known risk factors for HTLV-1 infection in endemic areas. Higher HTLV-1 prevalence in those residing at low elevation suggests transmission by an environmental vector - e.g., by arthropods.

W.G.P.27

HIV SEROPREVALENCE SURVEY AMONG HIGH RISK FEMALES AT MOMBASA, KENYA

Muga, G. S. G., Adoo, S. T., Mwachiro, E. S., Njenga, E. S.

Kenya Medical Research Institute; Ministry of Health; Public Health Department of Mombasa Municipality

Objective: To assess the prevalence and distribution of HIV infection among female prostitutes at Mombasa. **Method:** 260 high risk female workers living in bars and soliciting for men in bars and in Mombasa streets plus women known to entertain men in their homes in certain parts of Mombasa town were sampled using cluster method and recruited into the study. The women were asked to report to Communicable Diseases Control department at Guyoni, Mombasa. While at the Guyoni clinic, verbal consent was taken. 5 ml of blood samples were collected from the women and blood sera was later separated at Coast General Hospital Laboratory, Mombasa and Enzyme Linked Immunosorbent Assay (ELISA) test using enzyme linked anti-HIV was done. A written questionnaire was administered by asking the study subjects questions and filling in forms. **Results:** 144/260 (55.4%) women were seropositive for HIV; 80/366 (21.8%) were positive for syphilis; 32/366 (8.7%) positive for both HIV and syphilis; 48/366 (13.1%) were positive for syphilis alone and 112/366 (30.6%) HIV alone. **Conclusion:** The HIV infection among high risk females in Mombasa is definitely high and there is urgent need to organize counselling sessions for the patients.

W.G.P.28

PREVALENCE OF HIV-1 ANTIBODY IN STD PATIENTS.

Hein, Kefauver, Babson, D., Davis, M., Zwi, D., and Kabeta, T.

Armed Forces Hospital, Adis Ababa, Ethiopia; National Research Institute of Health, Adis Ababa, Ethiopia.

Objective: To determine the prevalence of HIV-1 antibodies in patients with STDs attending one of the clinics in Adis Ababa, Ethiopia. **Methods:** Sera from 500 consecutive STD patients (496 male and 4 female) were examined for the presence of HIV-1 antibodies. The serological tests were carried out by ELISA (Walloco) and confirmed by Western Blot (Biorad). **Results:** Of the 500 tested 60 (12%) were HIV-1 antibody positive. The prevalence of HIV-1 antibodies varied with the type of STD:

STD	No. of patients	HIV-1-Ab %	
Gonorrhoea	194	17	8.8
Chancroid	85	16	18.8
Non-gonococcal urethritis	117	5	4.3
Lymphogranuloma venereum	21	3	14.3

Conclusion: The prevalence of HIV-1 infection among STD patients is 12%. This infection rate is higher than that of blood donors (1.6%) but lower than figures for prostitutes in Adis Ababa (18.8%).

W.G.P.29

HIV-1 PREVALENCE IN RAIBOBI SEROTYPED POPULATIONS.

Mwera-Achola, Jackson O. A., Datta, R. P., Wanyaki, P.,

O'Gara, L. J., Smith, A. K., Smith, P., Wanyaki, P.,

University of Nairobi, Nairobi, Kenya; Kenya Medical Research Institute, Nairobi, Kenya; Nairobi City Commission, Nairobi, Kenya; University of Manitoba, Winnipeg, Manitoba, Canada.

Objective: To monitor the rate of change in HIV-1 in at-risk populations since the onset of the epidemic at the beginning of the decade. **Methods:** Data arising from all the studies related to sexually transmitted diseases (STD) and HIV conducted among men and women attending an STD clinic, pregnant women and a cohort of prostitute living in one geographically defined area of Nairobi. **Results:** HIV seropositivity (HIV+) rates increased from 0 to 24% in STD clinic patients, with the largest increase occurring in men with abnormal. Among prostitutes, the HIV+ increased from 1% to 80%. HIV+ in pregnant women increased from 0 to 3.7%. **Conclusion:** HIV infection rate is spreading most rapidly in the Nairobi populations with the highest sexual activity. A slow but steady increase in prevalence of HIV+ in pregnant women suggests substantial spread to the general population.

W.G.P.30

HIV ANTIBODY TESTING AT AN ALTERNATIVE HEALTH CARE SITE IN KENYA

Wanyaki, P., O'Gara, L. J., Smith, A. K., Smith, P., Wanyaki, P.,

University of Nairobi, Nairobi, Kenya; Kenya Medical Research Institute, Nairobi, Kenya; Nairobi City Commission, Nairobi, Kenya; University of Manitoba, Winnipeg, Manitoba, Canada.

Objective: To determine the prevalence of HIV-1 antibodies in patients with STDs attending one of the clinics in Adis Ababa, Ethiopia. **Methods:** The AIDS Control and Prevention Center in Nairobi, Kenya provided anonymous and confidential HIV antibody test for patients with STDs attending the clinic. **Results:** To the end of November 1988, a total of 7,793 individuals agreed to have their HIV antibody and appropriate counseling was given. **Conclusion:** HIV seropositivity testing and counseling was found to be seropositive.

Risk Group	Total	Positive	No. (%)
Sex partner	100	10	10
Male heterosexual partner	244	11	4.5
Non-Chinese	244	11	4.5
Metropolitan	244	11	4.5
IV drug abuser	212	0	0
Non-Chinese	212	0	0
Metropolitan	212	0	0

Conclusion: A total of 128 individuals requested HIV antibody testing because of various forms of contact with known HIV-infected individuals and only one homosexual partner of an HIV case was found to be seropositive.

Form of contact	Sex partner	No. tested	No. (%)
Sex partner	100	10	10
Male heterosexual partner	244	11	4.5
Non-Chinese	244	11	4.5
Metropolitan	244	11	4.5
Health care worker	84	0	0
Sexual/household contact	24	0	0

Follow up: HIV antibody tests were performed for 82 seropositive homosexual and 263 heterosexual after a median period of 8.7 months (0.9-31.8) and 1.1 months (0.3-32) respectively and only one homosexual showed HIV seropositivity after 8 months. **Conclusion:** The prevalence of HIV-1 infection in a sample of homosexual in Hong Kong is higher than that in non-Chinese. The prevalence in the heterosexual population is below 0.05%.

Session d'affichage Poster Session

W.G.P.7

THE IMPACT OF HIV INFECTION ON CHILD SURVIVAL IN AFRICA
Yalowitz, Linda A.***, Morris, J.R. & May, P.O.***
*U.S. Agency for International Development, Washington, DC,
USA, ** U.S. Bureau of the Census, Washington, DC, USA.

Objective. To estimate infant HIV infection prevalence and infant mortality rates associated with transmission of HIV, and to compare these figures with estimates of overall infant mortality and child survival rates.
Methods. HIV seroprevalence data from pregnant women living in 16 countries in East, Central, and West Africa are used to estimate HIV infection prevalence and HIV-attributable mortality rates in infants, assuming 25-60% vertical HIV transmission; and infant mortality of 20-25% among infected offspring. Estimates are compared with U.S. overall infant mortality rates.
Results. The results for East African capital cities are:

City	HIV Prevalence in Infants	HIV-Attributable Infant Mortality Rate	Overall Infant Mortality Rate
Nairobi	0.1-0.6	7.2	75.000
Litenge	2.4-3.7	5-14	150
Mogoto	0.3-0.6	2-2	141
San Jo Salvan	0.2-0.2	2-2	106
Kampala	6.0-16.3	15-38	103

The estimated infection prevalence in Africa is Central and West Africa ranges from 0.1-11%; the HIV-attributable infant mortality rates from <1-27%.
Conclusion. These estimates show that infection-transmitted infection having a low impact of overall infant mortality in some areas but a major impact in others. However, the later mortality of HIV-infected children who survive infancy may have a substantial impact on child survival rates.

W.G.P.9

CORRELATION OF HYPERGAMMOGLOBULINEMIA WITH ASYMPTOMATIC AND SYMPTOMATIC HIV INFECTION IN A COHORT OF AFRICAN INFANTS
Munyaho, G., Kiser, K., Nya, T., Mwalili, S., Njau, J., Baheta, C., Brown, F., Reid, S., Kinshasa, Zaire; Centers for Disease Control, Atlanta, Georgia, USA

Objectives. To examine the relationship between hypergammaglobulinemia and HIV infection in a large prospective cohort of African children.
Methods. 473 children born to HIV-infected women and 597 children born to uninfected and postpartum uninfected women have been followed prospectively since birth. Quantitative immunoglobulin (IgM, IgG, IgA) assays at 9 months age are being compared with serologic and clinical markers of HIV.
Results. Being perinatally HIV antibody (second 12 months) as laboratory evidence of HIV infection, and of clinical signs by the WHO criteria as suggestive of symptomatic infection, mean immunoglobulin levels are shown.

	IgG	IgM	IgA
Asymptomatic, persistently HIV ab+	28	1939	163
Asymptomatic, HIV ab-, mother HIV+	4	1372	112
Symptomatic, HIV ab+, mother HIV+	12	2132	236
Asymptomatic, HIV ab-, mother HIV+	157	1056	128
Asymptomatic, HIV ab-, mother HIV-	224	1030	102

Of children born to HIV-mothers (many still with other infections or malnourished), 17% had total IgG1500; of children born to HIV-mothers, 20% of uninfected children and 90% of infected children had total Ig1500.
Conclusion. High IgG were a sensitive marker of HIV infection even before symptom onset, and were uncommon in children ill with other infections.

W.G.P.11

UPDATE ON THE TRANSITION FROM HOMOSEXUAL TO HETEROSEXUAL AIDS IN TRINIDAD AND TOBAGO
Farley Cleburns*, K. Batio***, C. Diaz**, M. Francis**, B. Hall**, C. Bartholomew.

The University of the West Indies, Port of Spain, Trinidad
**The Caribbean Epidemiology Centre, Port of Spain, Trinidad
***Trinidad and Tobago (pop. 1.2 million) reported 289 cases of AIDS up to December 31, 1989 (185,000). The first case was recognized in 1983 and all 27 cases in 1983-84 were in homosexual/bisexual men. In 1985 there were 5 cases of heterosexual AIDS and 33 cases in homosexual/bisexuals. However, while there was only a 2 fold increase in homosexual/bisexual cases over the following three years, to 61 cases in 1988, there was a 12 fold increase to 66 cases among heterosexual AIDS cases and in 1989 there were more heterosexual than homosexual/bisexual cases of AIDS (66 vs 61). Notably, there has been a rapid increase of AIDS among women so that while in 1985 there were only 4 cases there was a 10 fold increase to 42 cases in 1989 during which interval there was only a 2 fold increase among men (36 vs 106). In 1989/90 all the cases of AIDS in women were infected by bisexual men. Intravenous drug abuse is not practiced in Trinidad and Tobago and transfuse associated AIDS accounted for only 7 cases (1.8%). On the other hand, 36% of the homosexual/bisexual cases were in bisexual men.
Trinidad, therefore, serves as a model of the potential for transition from homosexual/bisexual to heterosexual AIDS, initially through bisexual activity and without the added risk factor of IV drug abuse.

Implications Internationales International Issues

W.G.P.8

THE NATURAL HISTORY OF HIV INFECTION IN TWIN PAIRS BORN TO HIV-POSITIVE IN UGANDA
Merrill, Bruce P.***, Nya, M.***, Mwalili, S.***, Kinshasa, Zaire; University of New Orleans, USA; **CDC, AIDS Program

Objectives. To describe the clinical and serologic progression in pairs of twins. Nine "case" twin pairs born to HIV women and 10 "control" pairs born to HIV-negative women have been followed for the 18 month post-partum period. Blood drawn at 18 and 36 months was tested for HIV. All episodes of illness through age 18 months were recorded.
Results. Five case and 9 control pairs survived the first year of life.

Case pairs	HIV Serology	Clinical
Pair 1	11/18 Mo/No	11/18 Mo/No
Pair 2	11/18 Mo/No	11/18 Mo/No
Pair 3	11/18 Mo/No	11/18 Mo/No
Pair 4	11/18 Mo/No	11/18 Mo/No
Pair 5	11/18 Mo/No	11/18 Mo/No
Pair 6	11/18 Mo/No	11/18 Mo/No
Pair 7	11/18 Mo/No	11/18 Mo/No
Pair 8	11/18 Mo/No	11/18 Mo/No
Pair 9	11/18 Mo/No	11/18 Mo/No
Pair 10	11/18 Mo/No	11/18 Mo/No

Chorioamnionitis was diagnosed in the placenta from the dizygotic pair 1. In addition, twins were breastfed while twin 2 refused to breastfeed.
Conclusions. The discordant serologic and clinical pictures seen in these twin pairs suggest that environmental and genetic factors, environment and genetics, variations in HIV natural history can be documented.

Asymptomatic, HIV ab-, mother HIV+	157	1056	128
Asymptomatic, HIV ab-, mother HIV-	224	1030	102

Of children born to HIV-mothers (many still with other infections or malnourished), 17% had total IgG1500; of children born to HIV-mothers, 20% of uninfected children and 90% of infected children had total Ig1500.
Conclusion. High IgG were a sensitive marker of HIV infection even before symptom onset, and were uncommon in children ill with other infections.

W.G.P.12

CLINICAL MANIFESTATIONS OF AIDS IN QUITO, ECUADOR
Singerberg, Roy*, Sempiternal, R.*** and Morera, M.***, Ministry of Public Health, Quito, Ecuador. **Catholic Univ., Guayaquil, Ecuador

Objective. To evaluate the clinical manifestations of AIDS in Quito, Ecuador, in order to plan appropriate management of further AIDS patients and add further information to the global picture of AIDS.

Methods. A review clinical data of all AIDS patients in Quito until June, 88, via chart review and personal contacts with patients and their physicians.
Results. As of June, 1988, only 10 patients had presented with clinical criteria for AIDS in Quito. (pop. approx. 1 million). (By Jan. 10, 1989 there were 20 AIDS cases in Quito, 40 in Guayaquil (pop. approx. 2 million) and a total of 41 in Ecuador (pop. approx. 10 million). The 10 AIDS patients were young (20-40 yrs. 98%), male (89%) Ecuadorian citizens (68%) infected via homosexual (42%) or heterosexual (20%) contact, IV drug abuse (20%), or blood transfusions (20%). They were infected in the US (90%) or Germany (10%). "SILM DISSEAS" (wasting caused by HIV) was present in 90%, with the wasting accompanied by chronic diarrhea in 78%, and by chronic fever and debility in 20%. Pulmonary disease was less frequent (42%), with no known cases of P. carinii pneumonia, but with one death due to untreated pneumonia. Other conditions included skin disease (60%), hepatobiliary disease (40%), Candida esophagitis (40%) and neurological manifestations (40%). Mean time from first symptoms to death in 7 patients was 8 months. All AIDS patients are alive 12 and 2 months after first symptoms of AIDS, with the 10th lost to follow-up.
Conclusions. "SILM DISSEAS" (wasting due to HIV) is an extreme condition rapidly fatal manifestation of AIDS in Quito, Ecuador. Other common diseases in AIDS are also present, but with very little P. carinii pneumonia.

Implications Internationales International Issues

Aspects cliniques (Part 1) Clinical Features (Part 1)

W.G.P.1 HIV, HVL1-Delta-HEAT AND T_HCELL DEFICIENCY IN TWO RURAL AFRICAN AREAS: de Lalla Fausto, Rizzardi G., Pallini P.L., Ahmed L., Santos D. and Verga G. Sava Hospital, Genoa, Italy.

Objective: To compare the seroprevalence of HIV, HIV-Delta agent and T_H cell infections in the rural populations living in North Uganda (NU) and in Central Burundi (CB).
Methods: Sera collected in March-October 1988 (Uganda) (RIBA method) and in June-October 1987 (Burundi) were stored at -20°C until tested for HIV₁/HIV₂ (RIBA method) and anti-HIV antibodies (ELISA and IFA) and screened for ophtalmic using the T_H cell haemagglutination (T_HHA) test (80%). Samples showing reactivity against HIV p 24 and p 41 (or p 100) in NU were considered as anti-HIV positive. HIV₂ positive sera were also tested for anti-delta antibodies (RIA method).
Results: The 309 sera collected in NU were obtained from 289 outpatients (174 patients and 115 soldiers) and 20 patients (DO 18 and 19) clinically suspected of being AIDS cases). In CB, sera were drawn from 20 healthy individuals and 27 hospitalised (all with clinical diagnosis of AIDS) patients (204 males and 104 females) were adult (age range: 14-60). In Uganda people 63.5% of anti-HIV positive and 25.5% of anti-HIV negative patients were found to be T_HHA-positive respectively (p < 0.01) for IgG; the corresponding figures were 21.4% and 1.8% respectively (p < 0.001). As for full blown AIDS, T_HHA positivity was 62.5% and 25.5% in NU and CB respectively. No association was seen, on the contrary, found in both areas between either anti-HIV or T_HHA positivity and seropositivity for delta hepatitis serological markers (p > 0.01).
Conclusion: This study confirms the association between seropositivity for HIV and T_H cell (T_HHA), suggesting common patterns of transmission. It also shows no correlation between either anti-HIV or T_HHA positivity and markers for delta hepatitis in two rural African areas.

W.G.P.3 A TWO-YEARS EXPERIENCE IN HIV-POSITIVE PATIENTS IN HOSPITAL DE CLINICAS DE PORTO ALÉGRIE (BRASIL).
Spritz, Eduardo; Krawfick, M. Lucia, M.A. Hospital de Clinicas de Porto Alegre, Rio Grande do Sul, Brasil. Universidade Federal do Rio Grande do Sul, Brasil.

Objective: Describe HIV-positive patients in Hospital de Clinicas de Porto Alegre (HCPA) experience in HIV-positive patients according to risk groups.
Methods: It was reviewed 185 registers of HIV-positive patients who were at HCPA during January 1988 till December 1989.
Results: There were 173 men and 13 women. Among risk groups: 74 (40%) were homosexual men; 75 (40.5%), bisexuals men; 10 (5.4%), with compulsive disorders; 8 (4.3%), drug addicts; 8 (4.3%), had multiple transfusions; 6 (3.3%), bisexuals and drug addicts; 16 (7%), heterosexuals (14 women and 2 men), all with genital lesions.
Conclusion: As in other countries, the greatest group are the homosexual and bisexual men with 85% of the sample. As a whole group, those who received transfusion (blood disorders and multiple transfusions) have 10% of the sample. Drug addicts, as a risk group are not so numerous as in other countries. Although our sample is not so large, it appears that heterosexual contamination occurs only in individuals with genital lesions.

W.G.P.5 ABOUT MONITORING OF HIV-SPREAD IN A DEVELOPING COUNTRY

BORRACCHINI R. *, RICHTER C. **, BACHOF F. *
* Institut für Sozialmedizin der Freien Universität Berlin, Hirtzfelder 18, D-10005 Berlin 33
** Diakonissenanstalt, D-2800 Bremen, FEDERAL REPUBLIC OF GERMANY

Objective: To determine the actual AIDS-risks and introduce prevention efforts with the means of a primary health care system.

Methods: Since 1986, HIV-spread was monitored in an African district hospital. HIV-testing was done in patients with possibly HIV-related disease, such as syphilis (serum treponem), intravenous STDs, or spumant-positive TB. In the present population of disease helped to give early evidence of prevalence-estimates. In the general population, "risk-groups" were contacted, infection-risks were traced.

Results: A rise of antibodies and spumant-positive TB was stated in the area. No rise of "serum treponem" was found. In young adults with syphilis, a high coincidence with HIV-infection was found.

Conclusion: Syphilis e.g. - easy to diagnose even by health workers - could become an "indicator disease" for HIV-spread without HIV-testing. This requires a broader monitoring of such diseases in areas not yet AIDS-afflicted. With such a "basic monitoring", regional HIV-spread could be determined and prevention-efforts could be focused.

W.G.P.2 MARQUEURS DES RETROVIRUS (HIV ET HTLV-I) ET DU VIRUS DE L'HEPATITE B CHEZ LES LEPREUX AU CONGO.
A. Houe-Vicqour*, E. Sandoz-Gosselin*, G. Lelondré*, M. Verdier**, M. Mounier**, Francis Dohin**, *Institut supérieur des sciences de la santé, Brazzaville, Congo ; **Département de Virologie CHU Dujovyer, Limoges, France.

Objectif: Déterminer la prévalence des marqueurs HIV, HTLV-I et HBV chez les lépreux et dans des populations témoins au Congo. Comparer les marqueurs HBV en fonction du statut sérologique HIV dans les deux groupes.

Méthode: En 1988 un total de 809 patients à 318 lépreux et 482 témoins ont été soumis à un prélèvement de sérum dans 2 zones du Congo.
Méthodes: Dépistage HIV par ELISA (Abbott recombinant HIV-EIA), HTLV-I par immunofluorescence indirecte ; confirmation par Western Blot (BiaPac Lab Blast I et II, Diagnostica Pasteur pour HIV ; avec souche HUT 102 pour HTLV-I). Les marqueurs HBV : Ag HBs, anti-HBc, AgHBe, AgHBe, anti-delta par Abbott EIA. Résultats: Globalement, les prévalences sont respectivement pour les témoins et les lépreux de 3,2% et 3,8% pour HIV, de 1,9% et 1,7% pour HTLV-I et de 5,6% et 7,2% pour l'Ag HBs.

En fonction des zones géographiques, de très fortes variations sont observées allant pour HIV de 0,7% à 8,3% chez les témoins et de 1,9% à 10,2% chez les lépreux. Chez ces malades, la prévalence HTLV-I va de 0,2% à 23,8%. Les paramètres HBV sont analysés en fonction de la séropositivité HIV et HTLV-I. Conclusion: Il y a pas de différence statistique entre les prévalences HIV chez les lépreux et les témoins, ni entre les formes polaires de lépre à l'existe pas de différence de "profil" sérologiques HIV entre séropositifs et séro-négatifs. En revanche, les lépreux sont significativement plus infectés par le HTLV-I que les témoins.

W.G.P.4 A SERUM FOR UNRECOGNIZED HIV INFECTION IN A SPECIAL STD CLINIC IN KENYA.
Alphaj, Rashid*, Bahadani, K. **
*Department of Public Health, Ministry of Public Health, Kenait.
**Department of Microbiology, Faculty of Medicine, Kenait University, Kenait.

A three month survey for the presence of unrecognized HIV was conducted August through October 1989, on a total population of 3123 STD exposed patients and voluntary presymptomatic counsees who presented themselves for standard STD testing. Of this total, 104 were selected (30%) for HIV testing by methods of ELISA, and when required, Western Blot. The sample group was classified according to sex, marital status, occupation, age group, nationality (Kenya or non-Kenyan), and sexual history.

The sample group represented travelling to total of 27 different countries within the previous six months and were queried on their sexual history, including heterosexual/homosexual encounters and homosexual/sexual/sexual history. Clinical diagnosis was also recorded.

No HIV infection could be identified in the sample, which otherwise would appear to be a group at higher risk. One explanation may be that the group is not characterized by repeated sexual exposure and hence were HIV drug addicts or users.

W.G.P.6 AIDS ASSOCIATED ENDING INFECTIOUS DISEASES IN MADRID
GARRA, L. Morales R*, Falcón M, Bezo E*, Mora J., Veldesque J., Saldana P.,
**Direccion de Epidemiologia, Ministry of Health, Mexico

Objective: To define the characteristics, epidemiological distribution and clinical evolution of AIDS associated endemic infections.

Methods: Information was taken from registries notified to the General Directorate of Epidemiology between January 1981 and October 1989.

Results: Clinical information was available from 881 patients (87% men and 89% between 25 and 45 years of age). Data on reported diseases at time of initial AIDS diagnosis are: P. carinii pneumonia (PCP) 7% (n=60); other infections 79% (n=452); Kaposi's sarcoma (KS) 5% (n=28) and infections (215, 24%) were: tuberculosis (71,8%), pneumococci (n=81), cryptococcosis (10,1%), histoplasmosis (9,1%), blastomycosis (8,2%). Pathogens identified once were T. gondii; 1. 2nd, C. trachomatis, A. lumbricoides, P. malariae. Enteroptorogones represented 7% of all observed infections. Chronological, regional, transmission categories, and prognostic differences were distinguished. Endemic infections are associated with an increasing number of AIDS patients as the epidemic evolves in rural areas, to heterosexuals and to lower socioeconomic levels. Prophylaxis and treatment probabilities should be explored.

T.G.P.19 SMALL PARTICLE PERMEABILITY OF USED VERSUS
UNUSED SURGICAL RUBBER GLOVES
Goldstein, Andrew; Stokes, K.; Yoshihara,
P.; Arya, S.C.,
Spitoco, Inc., Beaverton, Oregon, USA

Introduction. Surgical latex rubber gloves are repeatedly re-used in many third world countries after being washed and sterilized. A study was conducted to determine whether used and unused surgical rubber gloves are permeable to particles the size of HIV-1.

Methods. Surgical gloves were obtained from several medical facilities in New Delhi, India as well as the United States. Samples of the glove palm, back and fingers were used as barriers to 0.1 micron fluorescent, polystyrene beads. The rubber was subjected to a stretching protocol designed to mimic actual use conditions.

Results. The likelihood of transmission of particles through the latex rubber samples was dependent upon frequency of stretching, exposure time and condition of the rubber.

3 OF SAMPLES SHOWING PARTICLE TRANSMISSION

GLOVE SAMPLE	WITH STRETCHING	WITHOUT STRETCHING
Unused (India)	45	4
Used (India)	100	34
Unused (USA)	0	0

Discussion/Conclusions. Re-used surgical rubber gloves are more porous to virus sized particles compared with unused gloves. Anti-microbial contaminants in latex may affect the viability of virus particle transmission.

T.G.P.21 ADAPTING US/AFRICA EXPERIENTIAL EXERCISE INTO AIDS PREVENTION
COUNSELLING TRAINING IN DEVELOPING COUNTRIES
JO DOPPEL, A DEBATA*, & CHIRONGWA**

*HISCOM, Washington DC; **Lana Fee Research Project, Maposoa, Sierra Leone; ***AIDS Programme, Harare, Zimbabwe

Objective. To demonstrate that there are cultural sensitive and effective methods for adapting Western experiential exercises into AIDS prevention counselling training in developing countries.

Methods. This paper outlines some of the "Western stereotypes about people from developing countries and their relationship to others describe how such experiential exercises are role playing, leading and/or use death through guided visualization, and stimulating safer sex practices such as non-contraceptives with one another have been adapted into training in developing countries.

Results. Evaluation forms completed by AIDS prevention counselling trainees participating in developing country courses indicate that many of the adaptations have been highly effective. Improvements have been made as a result of the evaluation, though there is still much to be learned.

Conclusions. Many of the skills required for an effective AIDS prevention counselor can be enhanced through culturally sensitive adaptation of some of the experiential exercises developed in the West. Other skills, however, require development of culturally specific in-country methods.

T.G.P.23 AIDS AND ADOLESCENT: A PRELIMINARY STUDY OF YOUTHS'
PERCEPTION OF AIDS & DISEASE: NIGERIA EXPERIENCE
(SOLA YOUTH FORUMS, DR. DMS.),
UNIVERSITY OF IBB, IBB, NIGERIA

SUMMARY: Without doubt AIDS is a serious infection which has been associated with promiscuity and homosexuality. In Nigeria in spite of the mass campaign, the incidence of the disease is still reported to be on the increase. Hence, this study is designed to find out the perception of Nigerian urban youths of the disease, especially those related to health behaviour. In order to know what alternative strategies to employ with regard to prevention.

Objective: To identify the perception and attitude of Nigerian youths to AIDS disease.

Methods: A random sample of 100 Nigerian youths were selected from various parts of Ibb, representing 40 male and 60 female. Questions related to AIDS were asked by 2 interviewers.

Results: The result showed that inputs of the heavy campaign on AIDS, many Nigerian youths still did not regard AIDS as a serious disease. A large proportion considered it as a capitalist's ploy to down grade humanity and to ridicule the people of the 3rd world.

T.G.P.20 A STUDY ON HIV-1 INFECTION AMONG HEMOPHILIACS IN IRAN.
Bazari, Rezaei*, Nayfeh*, J., "Jabali",** and Kaydani, H.***
*Iranian Blood Transfusion Service, Tehran, Iran.
**Iranian Hemophilia Clinic, Tehran, Iran.
***Iranian Hemophilia Center, Tehran, Iran.

Objective. An HIV-1 seroprevalence study was conducted on 368 hemophiliacs found to be the only group exposed to HIV, among the high-risk groups studied in Iran so far.

Methods. HIV-1 antigen and antibodies were tested by ELISA (Recombinant HIV-1, Envirocon and HIV-Antigen, ITH, Abbott Diagnostic, U.S.A.

Immunoprecipitation Anti-HIV-1-antibody, Mahring Institute, W.Germany)

Results. 184(69/368) of the patients studied were found seropositive, i.e. 204(62/265) hemophilia A patients, 18(6/50) hemophilia B patients and only 24(3/23) of patients suffering from other bleeding disorders such as von Willebrand, platelet dysfunction and fibrinogenopathy. All the anti-HIV positive patients were positive for anti-PT4 and anti-CP4 and all but one with full-blown AIDS were negative for HIV antigen. The anti-HIV negative hemophiliacs were also tested for HIV antigens for possibility of recent infection, but none were found positive. The highest incidence of HIV infection was found in the sexually active group of 20-40 years.

However, no transmission was detected when all family members of 15 anti-HIV positive patients were examined.

Conclusion. Follow-up studies on hemophiliacs patients and screening of their families followed by provision of necessary information and counselling as well as control of imported clotting factor concentrates would be most important in the prevention and control of AIDS in Iran.

T.G.P.22 Prevention Counseling: Integrating Concepts and Techniques in
all AIDS Prevention Strategies
D. Stone*, N. Kalishba**, V. Orias***

*Jones Hopkins University/AIDSCOM, **The Support Organization (TASO) in Uganda, ***Department of Health/Division of Health Manpower Development and Training Service, Republic of the Philippines, U.S.A.

Objective: Since counseling is one of the only strategies to support behavior change in HIV prevention, it is imperative that health care providers, educators, and others are provided with training in counselling concepts and techniques. The authors describe various means of incorporating counselling training within cultural settings.

Methods: Using "Train-the-Trainer" Modules, health care providers, educators, and volunteers are being trained in basic prevention counselling concepts and techniques. Emphasis is placed on helping providers cope with client feelings raised by HIV infection (either real or imagined), as well as on helping providers focus on high risk behavior of their clients.

Results: Although counselling for behavior change is a new concept, techniques are being adapted in various cultures to provide support. By working with governments and non-governmental organizations within each country, people are being trained to provide their clients accurate information on HIV infection, to assess their own risk, and to cope with anxiety and fear.

Conclusion: Whether HIV prevalence is high or low, providing prevention counselling skills to educators, health care providers, or others is essential. Working within local and cultural parameters prevention counselling proves to be a successful method in helping people change high-risk behavior.

T.G.P.24 HIV/AIDS-RELATED TRAVEL AND MIGRATION RESTRICTIONS
DORIS M. MERRITT and Orlin A. Adler
McGill Centre for Medicine, Ethics and Law, Montreal, Quebec, Canada.

OBJECTIVE: To identify trends in national regulation and/or quarantine restricting travel and migration by those with HIV infection or AIDS.

METHOD: A comparative analysis of reports and data from multiple sources including national governments and non-governmental reports and a survey by questionnaire of all foreign representatives in Canada, and a review of applicable international law.

RESULTS: While some countries have adopted deliberate policies of non-restriction of visitors and temporary and permanent residents, over 20 others have policies that discriminate against travellers and migrants with HIV infection or AIDS through mandatory HIV screening, exclusion and/or deportation. Examples of extreme responses are the mass deportation of seropositive permanent resident workers, and exclusion of persons found during border searches to be carrying syringes/needles (AZT).

CONCLUSIONS: Mobility and travel are affirmed values in international law and practice, although states enjoy the unfettered right to admit and exclude foreign nationals. The World Health Organization has advised HIV/AIDS-related travel restrictions are "ineffective, impractical and wasteful". A disturbing trend is emerging, however, in which a significant number of countries have applied HIV/AIDS-related travel restrictions. The implications of such restrictions may impede global efforts to respond effectively to HIV/AIDS.

International Issues**

T.G.P.13 **Contraceptive Social Marketing Principles: Promoting Condom Use in Uganda and Tanzania for AIDS Prevention**
G. Stone*, D. Levy**, S. Saunders***
*Johns Hopkins University/AIDSCOM, **Academy for Educational Development/SOMDC, ***Academy for Educational Development/AIDSCOM, U.S.A.
Objective: To apply contraceptive social marketing techniques in promoting condom use for AIDS prevention.
Method: Social marketing techniques are being used in developing condom promotion programs for AIDS prevention in Uganda and Tanzania. They are used to enhance the perceived value and desirability of condoms through branding strategies, audience segmentation, and pricing strategies. Distribution and trade considerations are being addressed, and condoms are being distributed through "AIDS in the Workplace" projects in Uganda & Tanzania.
Results: Using GSM strategies for promotion of condoms for AIDS prevention and Tanzania appears to show an increase in condom acceptability and purchase.
Conclusion: AIDS prevention has stimulated the market for condoms in both Uganda and Tanzania. It appears that condom social marketing for protection from HIV infection may overcome substantial barriers usually found in condom use.

T.G.P.15 **EDUCATION AND LAW: THE CONTROL OF TRANSMISSIBLE DISEASES THROUGH THE CONTROL OF GOSSIP, IGNORANCE, AND DISCRIMINATION**
Traub, Kit, University of Georgia, Athens, Georgia, U.S.A.
Objective: To recall lessons from the history of the control of transmissible diseases and present effective, ethical, and scientific alternatives for the control of AIDS.
Methods: Review controls once applied to leprosy, plague, and syphilis, recognizes their recurrence in the AIDS disease, and present alternative ways of thinking about diseases, particularly AIDS.
Results: The current generation has an opportunity to confront AIDS, a fear-some "plague," without adopting dehumanizing rules as in the past with other transmissible diseases. Futile and ineffective gestures accumulate, producing great social damage without alleviating the causes or effects of AIDS. To keep our human perspective, we must first avoid referring to "AIDS Victims," speaking instead of "people with AIDS." Next, we must employ methods of disease control that are simultaneously effective, ethical, and scientific. Both the WHO and the Council of Europe have adopted enlightened, informed guidelines for avoiding discrimination in relation to HIV-infected people and people with AIDS. These efforts have been met by both support and resistance.
Conclusion: Ignorance, fear, and short-term political responses to the AIDS problem are counter-productive to the efforts to control the spread of AIDS. Alternative approaches are demonstrably more effective, while simultaneously preserving the human rights of infected persons and society generally.

T.G.P.17 **INTERNATIONAL AIDS PROGRAMS AT THE NATIONAL INSTITUTE OF HEALTH**
Bridgford, Kenneth*, Hamburg, M., Schambra, P., Whitescarver, J., Faulstich, A., National Institutes of Health, Bethesda, MD., U.S.A.
The presentation will include an overview of NIH International AIDS programs amounting to over \$18 million annually. Three programs will be emphasized. The first, the National Institute of Allergy and Infectious Diseases program of International Collaboration in AIDS Research, contributes to international health by strengthening scientific linkages between U.S. and foreign investigators in areas with major health problems due to HIV.
The second, the Fogarty International Center (FIC) program of International Postdoctoral Research Training Grants in AIDS, supports collaborative research and training involving American and foreign scientists in the epidemiology, diagnosis, prevention, and treatment of AIDS.
The third, FIC's International Training Grants in Epidemiology Related to AIDS, increases the capability of scientists in developing countries to conduct epidemiologic research related to AIDS and to carry out clinical trials and behavioral intervention prevention research. Establishment of an International Network for AIDS Research and Training will also be described.

T.G.P.14 **FOLLOW-UP OF GROUPS AT RISK FOR HIV INFECTION**
Lima, M.B., Jr., Lima, J.N., Abreu, M.B., Aoki, F.F., Goncalves, M. and Pedro, R.J.
UNICAMP, Campinas, Sao Paulo, Brazil.
An HIV counselling/testing service was created in June 1988 at UNICAMP with three main objectives: a) provide an alternative free HIV testing site coupled with pre and post test counselling; b) set up a longitudinal serologic surveillance to determine the rate of annual seroconversion rate among high risk groups; c) give the blood bank support on confirmatory testing of anti-HIV positive blood donors. Testing is done by an ELISA (recombinant DNA) assay; if positive, a second blood sample is tested by ELISA; if positive, a Western blot test is done for confirmation. If a high risk person tests negative, counselling is emphasized and a 6 month follow-up testing is planned. Up to now 167 persons have been tested; 122 positive by at least one ELISA assay.

RISK	NO. TESTED	NO. POSITIVE (%)
HIV & BISEXUAL MEN	49	6 (12%)
IV DRUG USERS	42	18 (43%)
SEX WITH HIGH RISK PERSON	17	1 (6%)
SEX WITH INFECTED PERSON	8	0 (0%)
NO HIV SEROPHILIC TRANSFUSIONS	8	0 (0%)
NONE OF THE ABOVE RISK GROUPS	44	6 (14%)

* no seropositives were seen at our service

T.G.P.16 **TRAINING HEALTH WORKERS IN ZAMBIA FOR HIV INFECTION**
A. Nyanhoro*, K. Kalumba*, M. Kelly**, A. Chingoma***, *University of Malawi, School of Medicine, Blantyre, Malawi
**Ministry of Health, Harare, Zimbabwe.
Health workers are increasingly having to inform patients that they are HIV infected or are suffering from an HIV-related illness, yet they rarely have experience or training in counselling; rather, their approach tends to be highly directive, allowing large gaps of only one-way communication. The use of a World Health Organization training manual is described, in a course consisting of one month intensive orientation and role-playing exercises, project work carried out after return-to-normal duties, over a period of four weeks, and a further intensive de-briefing and training session lasting three days. Although not all physicians and nurses are able to acquire the necessary skills in this kind of brief, concentrated training, a sufficiently large cadre has been created to form a series of nuclei in various institutions, for the further "snowballing" of the training programme in other areas of the country.

T.G.P.18 **DEVELOPMENT OF THE AIDS EPIDEMIC IN SOUTH AFRICA**
Simpson B, Martin SM, Dorn S, Spence S, Hays S*, Padoyevos DM*, Nelson SW**
*Medical Research Council AIDS Virus Research Unit, National Institute for Virology, Sewdoring, South Africa, **Johnannesburg City Health Department.
The seroprevalence of AIDS in South Africa represents an almost unique model of the interaction of type 1 (Western) and type 2 (African) patterns of AIDS and the dynamics of the epidemic are thus of considerable interest. Data on HIV seroprevalence obtained from a number of sentinel populations and AIDS cases reported voluntarily to the Advisory Group on AIDS have been used to construct a composite of the epidemiology of AIDS in South Africa. Analysis AIDS data to the end of 1988 still reveals a predominantly type 1 pattern with 73% of 166 reported South African cases occurring among white male homosexuals, compared to 14% heterosexuals and 2% paediatric cases. Seroprevalence data however, indicates a significant and rapidly developing epidemic of HIV infection in the black African heterosexual population, which may soon overtake the type 1 pattern contrasting the AIDS profile presently. Thus, while no South African black STD clinic attenders were HIV positive in 1986/87 (Trans Roy Soc Trop Med Hyg 1987; 81: 874-875), at the end of 1988, 1.3% of 1174 black female STD attenders 0.3% of 1395 family planning attenders and 0.1% of 1726 new blood donors (first half of 1988), were confirmed HIV seropositive. In the white population type 1 is still the predominant epidemiological pattern, with low seroprevalence in the general heterosexual population (2 of 738 male heterosexual STD clinic attenders being seropositive while no female STD attenders family planning clinic attenders were positive and also only 0.03% and 0.007% of male and female new white blood donors respectively).

T.G.P.7

DETAILED ESTIMATES OF THE CURRENT AND FUTURE EXTENT OF THE HIV/AIDS PANDEMIC IN SUB-SAHARAN AFRICA

SAHAR, P., J. Chin, J. J., Leung, S. M., Basseloni, L. G. 3rd

* World Health Organisation, Geneva, Switzerland
* WHO Regional Office for Africa, Brazzaville, Congo

Objective: To provide country-specific estimates and projections of HIV/AIDS in sub-Saharan countries for public health planning.

Methods: An AIDS projection model based on estimates of HIV seroprevalence and the annual progression rate from infection to AIDS was used.

Results: From the country-specific estimates, we estimate overall in 1987 that there were about 70,000 new AIDS cases in sub-Saharan Africa for a cumulative total since 1980 of about 100,000 cases in adults, and close to 40,000 in children. Approximately 2.1 million individuals are estimated cumulatively to have been infected with HIV in sub-Saharan Africa since 1980. By 1992, we estimate that there will have been a cumulative total of 600,000 AIDS cases in adults and 200,000 cases in children. In 1992 alone, we estimate that there will be about 250,000 new AIDS cases. This is more than the cumulative total number of AIDS cases in sub-Saharan countries to 1987.

Conclusion: Over the next 4-5 years, we estimate that there will be at least a 10-fold increase in AIDS burden in each of the countries in sub-Saharan Africa.

T.G.P.9

PLANNING A NATIONAL STRATEGY ON AIDS AND INJECTION DRUG USE: LESSONS FROM THE LITERATURE

McLellan, Betty; Kinsler, K. Federal Centre for AIDS, Health Protection Branch, Ottawa, Ontario, Canada.

Objective: To demonstrate how the literature can contribute to the development of a national strategy on AIDS and injection drug use.

Methods: The presentation will be based on an assessment of the literature (bibliographies will be made available) and specific illustrations from the Canadian experience.

Results: As of January 1989 in Canada, only 8% of a total of 2,337 identified AIDS cases were attributed solely to injection drug use. The prevalence of HIV infection among Canadian injection drug users is not yet known but early studies suggest that currently it is relatively low. The literature offers many lessons for a country that might be tempted to think it will escape the "second wave" epidemic. Needle-sharing emerges as a widespread cross-cultural phenomenon. Data describing rapidly increasing seroprevalence among injection drug users in Edinburgh, New York and Honolulu signal an urgent need to acquire baseline data and to recognize that any window of opportunity will soon close. Published material testifies to the complexity of the problem and the need for collaborative, multidisciplinary prevention programs. Risk reduction strategies can form the basis of a partnership between public health and addiction services. The effectiveness of interventions remains unproven, demonstrating the importance of conducting pilot studies with strong program evaluation protocols.

Conclusion: Canada is developing a national strategy to reduce HIV infection among injection drug users emphasizing collaboration, research and innovative program evaluation.

T.G.P.11

ELABORATION D'UNE STRATEGIE DE PREVENTION DU SIDA ADAPTEE AU MILIEU DE LA PROSTITUTION ORGANISEE A COTONOU, BENIN.

Verheide, Ronald* et Monseiro, Bruno **

*Université de Montréal, Belgique; **Université de Cotonou, Bénin.

Objectif: Elaborer un message et des modalités de prévention du SIDA adaptés aux caractéristiques socio-culturelles des prostituées de Cotonou, Bénin.

Méthode: Nous avons procédé à Cotonou à une enquête comprenant entre autres des entretiens individuels avec 61 prostituées. Le repérage de tous les immeubles où vivent et travaillent, au moins 4 prostituées, et des entretiens avec 5 vendeurs de condoms.

Résultats: La prostitution organisée, à Cotonou, est le fait de 600 à 800 femmes qui habitent et travaillent à plusieurs dans un même immeuble. Une stratégie de prévention adaptée à ce milieu doit tenir compte notamment des aspects suivants: (1) méconnaissance des risques réels d'infection, croyance en l'efficacité préventive de médicaments et des toilettes intimes, et ignorance de ce qu'est un préservatif et de la manière de l'utiliser; (2) une forte défiance lors du premier contact se transforme en grande réceptivité à l'entrevue à été menée avec tact et chaleur; et de préférence par une femme; (3) 2% des prostituées ont des clients; (4) la sollicité qui est sollicitée les prostituées habitent et travaillent sous un même toit peut être utilement exploitée; (5) la collaboration des vendeurs et d'ex-prostituées a été aisée et souhaitable; et (6) les préservatifs, dont le coût est prohibitif, doivent être accessibles aisément et à faible prix.

T.G.P.8

CONTROL OF TRANSFUSION RELATED TRANSMISSION OF HIV INJECTION STRATEGIES OF THE EC'S AIDS PRO

GRANDE FOR DEVELOPING COUNTRIES
VAN DER, C. J., MD, RBC; AMAT, T. MD; FRANGEN, L. MD, PhD
European Economic Community - AIDS Control Programme/Developing Countries, Belgium

Various strategies to reduce the incidence of transfusion related HIV transmission have been developed. These vary from exclusion of high risk behaviour donors and a reduction of the number of transfusions to screening of donated blood for anti-HIV antibodies. A number of these are being implemented with support from the AIDS Task Force of the EC in various countries in Africa, Latin America and the Caribbean. A choice for a particular strategy or combination of strategies must be made on the basis of an estimate of the costs and expected benefits of such an intervention. This is a function of the prevalence of HIV infection among the population, the existing infrastructure and capability of the health care system, including blood-transfusion services, and the cost of these interventions. Although screening of donated blood is a technical possibility, presently the cost of universal screening is prohibitive in many developing countries. The development of new tests however will influence strategy options. A preliminary analysis of various interventions in different countries is presented.

T.G.P.10

MEDIUM TERM PLAN FOR THE CONTROL OF AIDS IN CAMEROON-AFRICA: OCTOBER 1988-SEPTEMBER 1993.

Edje, Felix, L. Kapono**

*Chief of AIDS Control Service, **President of the National AIDS Committee, Ministry of Health, Yaounde, Cameroon.

Cameroon has a population of 10 millions and is located in Central Africa. It has borders with Togo, Central African Republic, Congo, Gabon and Equatorial Guinea.

Data from surveys of the general population of provincial towns in the age group 15-64 show HIV 1 seropositivity rates between 0.3 and 0.8 (less 0.1 in prostitutes up to 7% have been found positive). A total of 72 AIDS patients have been notified, including 5 pediatric cases.

The government has recognized that the AIDS epidemic poses a serious threat to the economic and social development of the country and has decided to give priority to combatting AIDS. A National Programme on AIDS has been approved, based on the global strategies as developed by WHO, with the participation of UNICEF, PHEC, EC, France, West-Germany and Canada.

A range of activities for the prevention and control of AIDS, integrated in the health care services of Cameroon, have already been initiated. The National Programme on AIDS has seven major components: (1) mass public information and education (1) blood screening establishment and rehabilitation of blood transfusion services (2) protection of the public health workers and children (4) establishment of an effective national surveillance system (5) drugs for treatment of STD and AIDS cases (6) operational research (7) training and orientation of health workers.

T.G.P.12

THE IMPORTANCE OF QUALITATIVE RESEARCH IN DEVELOPING OPERATIONS RESEARCH PROTOCOLS/STRATEGIES FOR GAY AND BI-SEXUAL MEN IN THE DOMINICAN REPUBLIC

Barra, Michael*, Paraja, Reynaldo**,

*Porter/Novell/ADCON, **ADCON, Dominican Republic

Objective: To determine to what extent research protocols and strategies must diversify to reach significant subgroups of gay and bisexual men in order to impact on sexual behavior.

Methods: Focus groups, individual in-depth interviews and USAID structured surveys at meeting places (bars, discos, bordellos, coffee shops) were conducted. Options with regard to language, sexual practices, social circumstances and others were explored.

Results: Initial findings indicate that there does not exist a homogeneous group of individuals or groups responsible for conducting RAQ surveys or other necessary research among these populations will need to carefully assess and understand the presence of heterosexuality is not necessary homogeneous.

Th.G.P.7

LIASON ENTRE LA DENSITE OPTIQUE EN ELISA ET LE RESULTAT DU WESTERN BLOT CHEZ LES DONNEURS DE SANG DE BRAZAVILLE (Congo)
M. NGA, H. NGANGA, P. N'PAPA, A. ITOU-NGAPOVO, N. COPIER, F. Yala, M. GAZILLIAT - CHU de Brazzaville, Hôpital Salyvérien, Paris, France, *CHU de Brazzaville, Congo.

Il existe au Congo un taux d'environ 40% de sérums positifs en ELISA et douze au western blot (WB) car contenant des anticorps anti-cœur, le plus souvent positif après une séro-gé.
Nous avons tenté de trouver une liaison entre la densité optique en ELISA et le résultat en WB.
Le réactif utilisé est ELAVIA Pasteur dans lequel le seul positif est de 0,300. Cette étude a été faite sur 130 sérums et a donné les résultats suivants :

	0,300 (C1)	0,100 (C2)
Western blot négatif	76	4
Western blot p24 positif	55	9
Western blot positif	3	81

Cette distribution diffère de façon très hautement significative de celle qui aurait été obtenue par un test (Chi carré = 162, p < 0,001).
Si nous considérons les sérums p24 positifs, l'odeur négative est de 163 (de 76 à 361). On peut donc définir la positivité en ELAVIA par un OD supérieure à 1, afin d'"écarter" les réactifs de western blot.

Th.G.P.9

MODIFIED WESTERN BLOT ASSAYS FOR HIV INFECTION
R. L. HARRIS and S. J. SHELTON, Department of Immunopathology, Postgraduate Institute of Medical Education and Research, Chandigarh 160 012 INDIA

Six thousand sera were screened for HIV infection as a sero-surveillance exercise at the P.C.T.M.E.R., Chandigarh, one of the national surveillance centers. The overall positivity rate was 3% by ELISA. Western blot assay is the acid test for confirming a diagnosis of HIV infection but the cost of WB kit is prohibitive. It was thus imperative to evolve a sero-economical system in developing countries. In the present study various reaction systems were tried: a) Protein A labelled to peroxidase, b) a three step procedure using anti-human rabbit and anti-rabbit labelled to peroxidase, c) an equivalent of a PAP system in tissues. It was found that results obtained with these reagents were comparable to those of avidin/biotin reagents supplied along with the kit. The strips stored at 4°C for 12-18 months gave satisfactory results. The background was minimum with protein A.
Thus with indigenously raised antisera and protein A conjugated peroxidase effective time and cost of WB can be reduced substantially. The system can be applied to cases with strong clinical suspicion. The Dupont kit may be reserved for borderline cases.

Th.G.P.11

BLINDED BY SCIENCE: DRUG AND THE CONFLICT BETWEEN "CLEAN DATA" AND HUMAN HEALTH CARE
Harrington, Mark; Wiley, K.; Eiso, J. AIDS Coalition to Unleash Power, New York NY, USA.

Objective: To use the trajectory of DRUG (Ganciclovir) through the regulatory maze to exemplify problems impeding drug approval and up-to-date health care. Methods: We contacted Syntex Corp., negotiated with FDA and NIAID, read the protocols for the controlled "delayed treatment" treatment IND and compassionate use protocols, and talked with ophthalmologists, community physicians and parents with DRUG infection. Discussion: DRUG is effective in over 80% of those treated for CMV infection, and is approved in 4 European countries. Because the data were derived from a compassionate, uncontrolled trial, FDA rejected Syntex' 1987 NDA application, instituting instead 3 interlocking trials, under which 40 persons would be untreated until progression of retinitis. Here, demands for data derived from "adequate and well-controlled trials" superseded concern for the 20% of PMA's endorped by CMV. Conclusion: Provision must be made for accepting evidence of efficacy when thousands have responded well to a therapy and when there is no approved alternative. "Clean data" modalities must be modified during the AIDS pandemic to speed effective drugs to those at risk.

Th.G.P.8

RAPID METHOD FOR DETECTION OF HIV1 AND HIV2 INFECTIONS
EVALUATION OF SENSITIVITY AND SPECIFICITY

C. CHU*, Daniel Zaldívar, E. Perez-Tellería*
* Hospital Niza de Aragon, San Sebastian, SPAIN

Objective: Evaluation of sensitivity and specificity of a rapid test (HIV CLONATEC) in the diagnosis of HIV1 and HIV2 infections by comparison with ELISA methods and western blots.

Methods: This rapid HIV test (CLONATEC/TECH) is an immunofluorescence device which involves synthetic peptides (SYNTRKO) as antigens to detect anti-HIV1 and anti-HIV2 antibodies.

Results: 484 sera from intravenous drug addicts were tested in the rapid test. 272 samples are positive for anti-HIV1 antibodies in ELISA (Vironostika anti-HIV ELI - ORGANON / ELAVIA Ac-Ab-AE 1 - PASTEUR) and 212 samples are negative (ORGANON). 271 are positive in the rapid test with the HIV1 peptide (sensitivity of 99,6 % for the HIV1) positive. 493 sera from the same source were tested for the presence of anti-HIV2 antibodies: 314 are negative, 19 are unreactive and 76 are positive in the ELAVIA Ac-Ab-AE 1 (PASTEUR) for HIV2. All these sera were tested by anti-HIV1, specific and anti-positive sera in the HIV2 ELISA are positive for anti-HIV1 antibodies in the two HIV1 ELISA. 34 sera among the 76 positive were tested by western blot (Diagnostics TM Immunoblot Assay (DBI) and Lab kit (PASTEUR) for HIV2). All these sera were tested by anti-HIV1, specific and no reaction was observed against reagent (pp 150) present in the HIV2 blot. All three sera are positive in the rapid test with the HIV2 peptide. These results show the great specificity of the HIV2 peptide in the rapid test.

Conclusion: 484 sera from a high risk population were compared in two ELISA tests, in the Target test and confirmed by western blot. The sensitivity of the rapid test is 99,6 % and specificity is 100 %.

Th.G.P.10

FDA REFORM: AN ACTIVIST PERSPECTIVE ON THE NEED FOR LEGAL AND REGULATORY CHANGE.

Harrington, Mark; Eiso, J.; McCarthy, M.; Long, J.; Kirshenbaum, D.E. AIDS Coalition to Unleash Power, New York NY, USA.

Objective: To propose methods of removing regulatory and legal obstacles to faster drug trials and wider access to experimental treatments. Methods: Analysis of protocols, budgets, subject demographics, oversight hearings and discussions with officials. Discussion: Drug approval in the USA takes 8-10 years, longer than many PMA's can expect to live. Current drug approval standards lag behind advances in biotechnology, statistics modeling, toxicology, immunology and virology, and patient advocacy. FDA oversight: Inadequate until the FDA stage, is often arbitrary and restrictive. Companies conduct poorly designed trials wasting of time and lives. Few people cannot participate in clinical trials due to lack of third party reimbursement. Conclusion: FDA must redefine toxicity standards and efficacy endpoints flexible enough to allow for growing knowledge of HIV disease. FDA staff must be expanded to cope with new responsibilities. Members of the AIDS community and ethicists must participate in IIR's and FDA advisory review committees. Health care, and not simply "pure data" must become an acknowledged part of the trials system.

NEIGHAND: WHO AIDS Research and Reference Reagent Program, Stacy, Stuart*, Moul, L. and Milman, G. ERCT* and Pathogenesis Branch, AIDS Program, NIAID, NIH, Bethesda, Maryland, USA.

The National Institutes of Health AIDS Research and Reference Reagent Program (Reagent) in Bethesda, Maryland is one of three collaborating centers established by the World Health Organization Global Programme on AIDS to facilitate the exchange of reagents needed for biochemical research on AIDS related retroviruses. The repository distributes samples of reagents, virus isolates, and antibodies to qualified investigators worldwide, whose research relates to AIDS. Currently available materials include:

- * Antibodies: Polyclonal and Monoclonal
- * Cloned Proteins
- * Expression Systems/Cloned cDNA
- * Isolated and Unisolated Cells
- * Virus Isolates
- * Biologicals, Chemicals and Drugs

The repository relies heavily on requests from individual laboratories. Scientists who wish to contribute to the program should contact the Principal Investigator regarding suitability and other requirements of substances. Contributions will be cited in the reagent catalog as the source and acknowledged in publications by the recipient. Contributions may also receive reports on the requests for their reagents. The repository encourages collaborative relationships between reagent users and laboratory techniques. Future plans include the distribution of standardized protocols. For further information contact Dr. Stacy by telephone at 301-964-0245 or FAX 301-762-4170.

Th.G.P.13 PHASE-I STUDY OF RECOMBINANT PEPTIDE CORRESPONDING TO THE GP17 TRANSMEMBRANE PROTEIN OF THE HIV-1 VIRUS COUPLED TO PFCCL.

Detlev Harberg; Schwander, B.; Hansen, D.M.; Lewin, B.M.; Schneider, J.M. **Helmholtz-Institut für Experimentelle Medizin, Clin. Dept., Hamburg, Germany**; **Wolfgang Knebel**, Cambridge, Mass., USA.

Objective: Animal experiments demonstrated that both polypeptides coupled to PFCCL can produce a T-independent immune response in route mice. The T-independent response engendered only antibodies. Antibodies directed at appropriate HIV epitopes could possibly block an ongoing infection of newly born T-cells with the virus as well as inhibit the formation of synchia between infected and healthy cells.

Methods: F-46 as a recombinant peptide equivalent to conserved regions of the gp17 of HIV-1 coupled to PFCCL in order to evaluate the toxicity and tolerance of this recombinant peptide. A phase-I study was performed in 18 patients with AIDS with different numbers of T-cells. Peptide was injected intramuscularly with either 0.1 mg of 0.3 mg. Four patients were boosted later on twice with a time interval of 4 weeks, one patient could be boosted only once. The patients were monitored carefully by laboratory and clinical examinations and antibodies were measured at days 0, 7, 14, 21, and 28. Patients 3, 4, and 12 after injection.

Results: All patients tolerated the injections well without any significant side effects. The serological as well as clinical examinations did not show any signs of toxicity. There was a significant increase in antibodies against the peptide after the first injection with significant fall during the first four weeks. Details of the antibody response of all patients including the boosted patients will be presented after the conference.

Th.G.P.14 AFRICAN HIV EDUCATION MOBILIZED THROUGH A PUBLIC-PRIVATE WORKSHOP

Wilson Lillard; Elder, H.M.; Hart, R. **Oregon Health Division, Portland, OR, USA**; **Merry Pettis** Memorial Veterans Hospital, Los Linda, CA, USA; **Loma Linda University, Loma Linda, CA, USA**

OBJECTIVE: To help health care professionals in Africa develop locally based HIV education programs (LBEPS).

Methods: A church with its US university and local mission hospital sponsored 2 workshops in Malawi in cooperation with the Government of Malawi, the Private Health Association of Malawi, and MKD. Presentations described goals necessary to control HIV spread. Working in small heterogeneous, interdisciplinary, groups, 200 participants from 15 African countries identified problems and developed solutions. These were combined into a document to be used in LBEPS.

Results: The broad sponsorship provided wide acceptability of the workshop to many different groups including various mission organizations and health workers. The diversity of participants resulted in stronger, more realistic plans for patient counseling, home care, public health measures, and HIV education. Evaluation showed participants considered this workshop "Africa" because the proceedings and conclusions were by and for Africans. Not expected to make changes in their practices based on the workshop. **Conclusion:** The model of private-public cooperative effort utilizing national health workers to describe and resolve problems can facilitate LBEPS and may be broadly applicable.

Th.G.P.15 THE ROLE OF FEMALE PROSTITUTION IN THE HETEROSEXUAL AIDS EPIDEMIC IN SOUTH AFRICA

Schabir Buzzi, PhD; Martin PJ, Smith AN; Lyons SF; **Friedrichsen DM**; Naidoo S. **Medical Research Council Research Unit, National Institute for Virology, Sandringham, South Africa**; **Johannesburg City Health Department, South Africa**

Many studies in Central and East Africa have confirmed the pivotal role of female prostitutes in the establishment, maintenance and expansion of pattern 2 (African) AIDS. In South Africa, until the latter part of 1987, no cases of AIDS were reported in the black population, while in the white population three cases observed in 1982 had risen to 48 (predominantly male homosexuals) at the end of 1987. Since the end of 1987 the number of cases in black South Africans (all heterosexuals of both sexes) has risen sharply to 24 by mid-January 1989 and the role of prostitution women in the development of this epidemic is confirmed by seroprevalence studies carried out in a number of sentinel colonies - e.g. among STD attenders, 1,788 of females were positive as at December 1988 in contrast to nil of the same population at the end of 1986/87 (Trans Roy Soc Trop Med Hyg 1987, 81: 874-875); male STD attenders had a somewhat lower prevalence of 0.4%. The female:male dominance was also seen in other cohorts and even in black blood donor populations - 0.15 versus 0.048 respectively. The reproductive rate (Ro) of the heterosexual epidemic is, to a major extent, influenced by the characteristics of this core of prostitution females and control measures need to be focussed on abating this core. Identification of prostitute populations in developing societies is far more difficult than in developed countries and licensing measures for control are virtually impossible because of the poor definition and transience of this population.

Epidemiology**

Th.G.P.16 ATTITUDES EXPLAINING DESERTION AND FAILURE OF CONDOMS IN GAY MEN

RAFAEL ANTONIO, BARBARA P. VALDESPINO A., SEPULVEDA S. **Division of Epidemiology, University of Health, Mexico**

OBJECTIVE: To describe the attitudes that may explain dropping condom use or refusing to use condoms.

Methods: In September 1988, a survey to determine knowledge, attitudes, and practices related to AIDS and condom use was carried out in gay men in the second largest city in Mexico. Data about attitudes were collected through agreement or disagreement of several statements about condom use. The comparison groups were the never users (non users), user but not correct users (misusers), and correct users of condoms (users).

RESULTS: Main results are shown in the next table.

STATEMENTS	NEVER USERS (%)	MISUSERS (%)	USERS (%)
Problems at sex are the main cause of condom.	30%	40%	<50%
Condoms take away the sensation.	30%	40%	<50%
You never will reject you if you use a condom.	30%	40%	<50%
Condoms are appropriate for gay men.	60%	74%	<80%
Condoms must be part of sexual routine.	60%	74%	<80%
Condoms frequently break or don't fit.	60%	74%	<80%
Condom use is not effective to prevent AIDS.	60%	74%	<80%
Condom use makes your partner feel you are AIDS.	60%	74%	<80%
If you suggest to use a condom partner feel depression.	70%	82%	<85%
There is AIDS in Mexico.	70%	82%	<85%

Conclusions: The reasons for desertion may be explained as follows: "breakers" are not convinced of the preventive effectiveness of condoms use, or that partners may think that if they propose the use of a condom it means they might have AIDS, either a condom breaks when they are used, or the other hand, the "non users" are more likely to use the risk than using always a condom, that he has taken away the sensation of the moment and that partners reject them when a condom is proposed. Continuity in condom use starts when the user feels that condoms are part of sexual life.

Th.G.P.17 HIV INFECTION IN PREGNANT WOMEN AND THEIR INFANTS IN ARGENTINA

Carla Amador; Orrego JM, Pignodovilla A, Rickard, H. **Hospital Fernández, Academia Nacional de Medicina, Hospital Militar, Buenos Aires, Argentina**

Objective: To present the first communication on HIV perinatal transmission in Argentina.

Methods: A total of 19 HIV-reactive mothers (HIV-Mo) was studied through HIA, HIV-1 and Immunofluorescence in 1988. Their children (Chi) were studied also thru EMWACRI and HIV-1 Antigen Abbott(Ac). Birth characteristics, Apgar index and weight were assessed, and clinical and serological follow-up of Chi was made thru periods of 5 to 18 months (m). Also, 2 Chi from heterophilic father and HIV-Mo, which births took place at another center, were studied.

Results: In 1988, 19 pregnant HIV-Mo were attended. HIV-Mo risk factors were: TWK17 HIV-VDR partner, 2; Age (3) 21 years old. Obstetric outcome: abortion; 1 premature birth and dead fetus(1); vaginal birth; 15; cesarean section; 4(21.5%). Birth weight (2,282 g, general population: 3,300 gr). Gestational age (32) 39 weeks. Apgar index (1) 8 (m); 5 (m); (mean): 1-2.9; 5-10 (0). Chi dropped out of 18 (Chi); HIV-1 Ac at birth; AG: 17(-) and 1(0); this one had a HIV outcome. Five (Chi) were HIV-DM; and 1, HIV-DM; Ten Chi were followed up from 5 to 18 m. The HIV-1 Ac showed seroconversion at 18 (m) (CRS-AG), and clinical signs at present. Three cases turned negative at 8, 9 and 16 m, respectively. HIV-1 Ac was positive at 2 out of 7 Chi with clinical signs, and 6 were DM-DM; and 3, DM-DM.

Conclusion: HIV perinatal transmission is a problem, even in countries with few AIDS cases. HIV infection did not alter the obstetric or neonatological features of this population. EMWACRI and AG did not help identify infected Chi.

Th.G.P.18 AIDS SURVEILLANCE AND PREVENTION IN UGANDA

Dr. Samuel Ouma; Berkley S. P., Fr. **Naamur W.***** **Sutherland D.*****

An review is made of the current status of the AIDS epidemic in Uganda following the establishment of a national AIDS Control Programme in 1987. A single surveillance reporting system was established to follow progression of the disease. By Dec. 1988, 17,000 cases had been reported. In 1988, 478 were reported, 536 females. The doubling time of cases was 3.5 months. The age distribution shows over 50% are between 40 yrs, about 10% < 20 yrs, only 11% cases have been reported between 5 - 14 yrs. The mean age for males was older than females (56.6 versus 24.4 yrs vs.).

A national survey yielded a similar pattern, but with a younger mean age. Sentinel surveys to monitor risk factors for seroconversion and future disease trends and progression.

The review shows heterosexual transmission is responsible for over 80% of cases, vertical, maternal, transmission about 10% and blood transfusion about 10%. Risk factors in transmission are discussed and increased. The role of sexual partners and sexually transmitted diseases are important amplifiers of transmission. The relative risk (odds ratio) increases proportionately to increased number of past sexual partners. The social cultural complications in disseminating health education are also reviewed.

Director Uganda National AIDS Control Programme.

G.501 CURRENT STATUS OF HIV INFECTION IN TAIWAN

Cheng-Hsin Chuang, Department of Health, Taiwan, ROC

Objective. To control the transmission of AIDS, this study has been conducted to investigate the status of human immunodeficiency virus (HIV) infection in Taiwan.

Methods. A total of 706,246 serum samples from 9 risk groups of acquired immunodeficiency syndrome (AIDS) were tested for HIV antibody, using mainly enzyme-linked immunosorbent assay (ELISA) and Western blot. Results: Among 1,188 homosexuals, 23 were positive (2.79%); 6 full-blown AIDS patients; 2 AIDS-related complex (ARC); 2 HIV seronegativity; 4 persistent generalized lymphadenopathy (PGL); 19 asymptomatic carriers. Among 526 hemophiliacs, 40 were positive (7.6%), of whom two developed full-blown AIDS. One asymptomatic homosexual HIV carrier donated four bags of blood which resulted in a seropositive patient. In general, antibody titers were higher in asymptomatic HIV-carriers. PGL and ARC than those detected in patients with full-blown AIDS. Conclusion. The conclusion is that AIDS has invaded Taiwan, but the prevalence of the HIV infection is presently low. In the interim, active community efforts are needed to achieve future success in AIDS control.

G.503

Dr. G.S. Geshki CDC EDG1¹
Dr. F.H. Maske MDH National AIDS Co-ordinator²
Dr. G.G. Mbugua CHR EDG1¹
Mr. H. Muthami NAC EDG1¹

1. Kenya Medical Research Institute, P. O. Box 54840, NAIROBI - Kenya
2. Ministry of Health, P. O. Box 30018, NAIROBI - Kenya

Since 1984 when the first case of AIDS was reported in Kenya more than 3000 cases of AIDS have been diagnosed in this country. The MIF rate is about 1% and the age distribution shows a bimodal characteristic with a small peak between ages 0 and 5 and a large peak between ages 15 and 30. The prominent clinical presentation is weight loss, prolonged diarrhoea, chest infections, candidiasis and kaposi's sarcoma. Recent surveys in selected large towns of Kenya have demonstrated high seroprevalence rates ranging from 12% to 24% among sexually promiscuous women. Samples taken from sexually active and promiscuous males in some of the towns have shown prevalence of about a third of the rates in corresponding females. Possible reasons for this distribution and implications for intervention measures will be discussed.

G.505

AIDS IN THE CONTEXT OF PRIMARY HEALTH STRATEGY.
BETS, C. (Lagos)*, Carrington, Carmen**
*Nigeria Against STD's (U.L.A.C.E.T.S.) U.S.A.

Objective. Demonstrate impact of the AIDS epidemic on primary health and community organization and participation.

Methods. Trends of the AIDS epidemic are compared with governmental and nongovernmental responses in Latin America. Their impact on primary health and community organization is discussed.

Results. The AIDS epidemic is being characterized by successive waves of transmission among certain risk groups. Health authorities have been under pressure by the scientific community and the general public to implement strategies targeted at specific risk groups involved. Major efforts have been in health education, with emphasis put on disseminating "knowledge" about AIDS and (2) behavior modification. The crisis of health education strategies becomes evident when transmission begins to occur among relatively stable heterosexual populations. In these groups it is situations of risk (i.e., sexual exposure to an infected individual) rather than behaviors of risk that are major determining factors of AIDS transmission. Here, effective responses depend on (1) primary health system and (2) level of community organization and participation.

Conclusion. Responses to the AIDS epidemic have usually weakened already insufficient primary health resources crucial not only for WHO's general health goals, but for the forthcoming waves of the AIDS epidemic.

G.502

DEVELOPMENT OF AN HIV/AIDS SURVEILLANCE SYSTEM
Sax, Ronald; Cann, J. Department of Health, Bermuda Government, Hamilton, Bermuda.

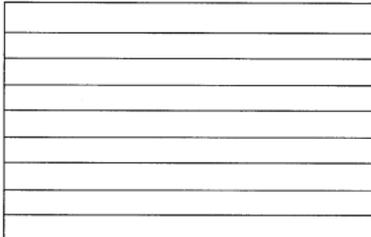

Objective. To develop an accurate and comprehensive system of surveillance and follow-up for AIDS cases and HIV sero-positive tests.

Methods. Although Bermuda (approx. 57,000 population) is a small jurisdiction with a single acute care hospital and HIV testing facility, reporting of HIV/AIDS from physicians has not been complete. To ensure accurate surveillance, a detailed reporting scheme was developed based on regular communication between public health, hospital and laboratory staff. A computerized data base utilizing a personal computer and commercial spreadsheet software was developed to track all HIV sero-positive individuals and AIDS cases.

Results. Organization of the surveillance scheme has ensured that all diagnosed HIV/AIDS cases are reported to the Health Department for recording and follow-up. A Nurse Epidemiologist provides counseling for all newly diagnosed AIDS patients and pre- and post-HIV test counseling provided by Health Department clinic staff. The accuracy of tracking and analysis has been improved through the development of the computerized HIV/AIDS data base.

Conclusions. A comprehensive surveillance system for HIV/AIDS can be developed utilizing currently available staff and resources by stressing effective communication between the public health department, acute care hospital and laboratory facility. A data base to provide accurate statistics for analysis and follow-up can be developed at low cost using proprietary software and a personal computer.

G.506

MOLECULAR ETIOLOGY OF AIDS: AN ANALYSIS OF EPIDEMIOLOGICAL AND GENETICAL ASPECTS

J. Sambamurti¹, P.T.A. Subramanian²

¹Dept. of Geography, Madurai Kamaraj University, Madurai-625002, India.

²Dept. of Medicine, Madurai Medical College, Madurai-625002, India.

AIDS emerged as a major general health problem globally refers to the last fatal stage of HIV infection. The ecological spectrum of AIDS may be understood in five stages and the ecological changes associated with AIDS makes it difficult to identify since it constantly changes or modifies its nature most along with genetic coding of the cells without making changes in its basic biology. The present study is an attempt to analyze epidemiological aspects with reference to spatial distribution and variation based on analyzing the ecological trends. The epidemiological situation revealed that AIDS has already claimed 1,24,114 cases and in which North America has registered 71,343 cases followed by Europe with 12,414 cases. Of the total number of 26225 AIDS cases reported from 125 countries, 89% of the cases were from United States in September, 1987. The analysis of AIDS cases reported by 6-month period from 1977 to 1987 revealed that 70% of the cases were from Americas followed by Europe (18.37%), Africa (14.4%), Oceania (1.05%) and Asia (0.27%). It can also be reported that between 500,000 and 3 million new AIDS cases will emerge from persons already infected with HIV. Statistical methods like ratio and percentage measure have been used to explain the ecological situations of AIDS in different countries and with this epidemiological analysis is presented.

G.513 The Constitution of the Organization of the African Union-OAU and AIDS

R.A.N.M. MAFAGO*

*Charge de Laboratoires, SCC-SIDA, St. Louis.

 The African struggle against AIDS means fundamentally:

- * Improve the living conditions of the Africans.

The improvement phase of the African standard of living may only be attained by the advent of a system of democratic parity, appropriate to the mentality of the People of this Continent.

 A democracy for Africa, a Continent which is essentially underdeveloped, is only possible in framework of the PanAfricanist Congress-PAN-C which is the social-judicial manifestation of the organization of the African Union-OAU,

- * and which contains four popular power branches:
 1. the PanAfrican Legislative Council;
 2. the Community Financial Audit;
 3. the Constitutional Community Court;
 4. the PanAfrican Executive Council.

G.515 EPIDEMIOLOGICAL FINDINGS OF HIV INFECTION AMONG WOMEN FROM SAO PAULO-BRAZIL.

FERRERIA A. Lopes*, J. Fernandes M. Acceturi C. Pinto W.†

 1. Paulista School of Medicine-Infectious Diseases Unit, São Paulo.
 2. Reference Center for AIDS. Out-patient care Unit, SP, Brazil.

Objective: To evaluate the extension of HIV infection of women in São Paulo state.

Methods: Among the women (10 years old) registered in two out-patient care Units from Jan 84 to Jan 89 a sample of 611 were studied. The test used was ELISA and confirmed by W.1.1. technique. The seroprevalence of HIV infection among the sexual partners, IV drug abusers and blood transfusion receipts was determined. Other epidemiological aspects will be analyzed.

Results: Seroprevalence of HIV antibody in those groups

Sexual Partners	HIV POS	HIV NEG	TOTAL
110000	78	422	500
110000	169	212	381
TOTAL	247	634	881

Conclusion: Many epidemiological aspects of HIV infection in women will be emphasized in this study. One of the most important is that among the IV drug abusers the seroprevalence was higher than in the sexual partners (33%)

G.517 VERTICAL TRANSMISSION OF HIV-2; LACK OF EVIDENCE

Bynalden, Birgit Bak*, Hejlskov, N., Mølbak, K.* and Aaby, M.*

*Statens Serum Institut, Copenhagen, Denmark. **University of Copenhagen, Copenhagen, Denmark.

Objective: To investigate the occurrence of vertical transmission of HIV-2.

Material and Methods: In a 3-year longitudinal cross-sectional community study from Guinea-Bissau based to investigate the epidemiology of cryptosporidiosis in children and their families, 113 mothers and their 143 children less than one year of age were tested for HIV-2 antibodies in order to elucidate the frequency of vertical transmission. Blood samples were tested for HIV-2 antibodies by indirect ELISA; positive results were confirmed by WB.

Results: Of the 113 mothers, 11 were found to be HIV-2 antibody positive. Two of the eleven children born of positive mothers were found to be HIV-2 positive. One was tested positive at 3 1/2 months of age and was lost to follow-up, the other was positive at 5 months but turned negative at 8 months of age. The remaining 9 children were repeatedly negative. No children born of HIV-2 negative mothers were found to be HIV-2 positive.

Conclusion: Vertical transmission of HIV-2 in Guinea-Bissau seems rare.

Maternal antibodies apparently disappear before 8 months of age.

G.514 IMPACT OF COMPUTER SCIENCE ON AIDS RESEARCH

General Objective: World Immunological Network Project Foundation, Los Angeles, CA, USA.

OBJECTIVE: To demonstrate the effort of learn and computer transmitted data on the dissemination of AIDS information among researchers and practitioners on the international level.

METHODS: Using Laser Disk and AIDS-Stack technology, and international data base, utilizing Diversified Network Applications (DNA) an AIDS research and treatment has been created for use by researchers and clinicians worldwide.

RESULTS: The Laser Disk and AIDS Stack methods of data collection increase the speed, timeliness and availability of the latest information on AIDS, avoiding duplication of efforts, fragmentation of locale and unnecessary expenditure of scarce resources.

CONCLUSION: There is a demonstrable need for centralizing information on AIDS to develop a cohesive, widely accessible body of data that is readily updated and revised. The computerized network of information enables researchers and clinicians to track epidemiological trends, exchange ideas on treatment protocol and document research results. The database also has applications in the educational arena where universities, clinics and nonprofit groups are involved in teaching the community about AIDS.

G.516 PREVALENCE OF POSTNATAL ANTI HIV ANTIBODIES IN THE STATE OF JALISCO, MEXICO.

*Instituto de Patología Infecciosa y Experimental "Dr. Fco. Ruiz Sánchez" de la Universidad de Guadalajara, Jalisco, México. **Departamento de Medicina Forense, Procuraduría Federal de Justicia del Estado de Jalisco, México.

Objective: To know the prevalence of postnatal anti HIV antibodies in corpse of unknown origin in the state of Jalisco, Mexico, and to determine the risk factor for health workers that are in contact with them.

Methods: Randomized samples of 87 corpses of unknown origin were taken from 2556 necropsies, during the year of 1988. At the beginning of each necropsy a sample of 5 cc of blood was taken from the thoracic cavity, to which ELISA assay was practiced, and confirmed by Indirect Immunofluorescence assay (IFA) and/or Western Blot (WB).

Results: The seropositivity obtained and corroborated by IFA and/or WB assay in HIV study, was 1.03% (one case), that belonged to a 30 years old male corpse, apparently from the USA, his death cause was medical intoxication, and in the necropsy there was also data of homosexuality. The health workers risk factor in Guadalajara, from being in contact with corpses of unknown origin HIV positive, is 1.03% and it increases to 25% with foreigners.

Conclusion: In our country the prevention rules should be increased in health workers in contact with corpses of unknown origin specially with foreigners, and probably with homosexuals.

G.518 HIV-1 ANTIBODIES IN BRAZILIAN PRISONERS

Costine, Antonio*, Peixoto, Z.*; Hernandez, R.; Lacouture, C.†; Lopez, L. and Mendes, M.*

Nicola Paviستا de Medicina, São Paulo, Brasil.

Objective: to measure the HIV-1 infection prevalence among male Brazilian prisoners.

Methods: The presence of HIV-1 antibodies was investigated in serum samples from 923 volunteers from a prison located at the inner-city area of São Paulo, obtained during April and May, 1988. They were clinically well at the time of blood collection. The serum samples were analyzed by indirect ELISA using a whole-virus preparation (VIR200® HIV-1 ELISA; Biotecro-Sulcilac), recombinant viral proteins (89 M405, Indurabio) and the synthetic peptide IgGMYKICR200 corresponding to a segment of gp120 from each test kit. Escola Paulista de Medicina.

Results: By using the three distinct serological methods, the prevalence of HIV-1 antibodies was 12.56% (115/923). This result may reflect the actual HIV-1 infection prevalence among the individuals within that prison, since some prisoners with risk factors denied to enroll in the study. False positive reactions due to antibodies to B cell line proteins were not observed.

Conclusion: The high prevalence of HIV-1 infection among Brazilian prison

HIV-1, as occurs in other countries, is mostly due to homosexual and drug-sharing exposures.

Publications

G.519 ASSENCE OF HIV-1 AND HIV-2 INFECTION IN AFRICAN TRIBES, 1960-72
 Schindler, J.; Jones, S.; Balala, R.; Reed, J. and Mufson, M.
 Marshall University, Huntington, WV, U.S.A.

Objective. To examine sera for HIV-1 and HIV-2 antibodies collected in Africa in the Pre-AIDS era.
Methods. 155 sera from Africa were collected as part of a respiratory epidemiological study from 2 tribes: 60 Mano (Liberia); 84 Korokore (Sierra Leone); and 15 Turkana (Kenya). These sera were tested for HIV-1 (Abbott HIV-1 EIA, Biotech/Diagnost), HIV-1 Western Blot (WB) and HIV-2 (Subout HIV-2 WB) antibodies.

Tribe	Number Positive or Indeterminate (%) / Number Tested (N)			
	HIV-1		HIV-2	
	ELISA	WB	ELISA	WB
Turkana	9/15 (60)	11/15 (73)	0/15	0/15
Mano	41/60 (68)	46/60 (77)	0/60	32/53 (62)
Korokore	56/96 (57)	33/93 (36)	0/83	15/45 (33)
Total	106/159 (66)	90/158 (57)	0/108	52/108 (48)

The frequency of positive EIA increased with age but indeterminate Western blot (WB) to HIV-1 or 2 did not increase with age. The most common bands detected by HIV-1 WB were p24, (70%) and p17(20%). HIV-2 WB detected bands to p66 (43%) and gp41(14%) but indigmantly to p24 (3%).

Conclusion: No HIV-1 or HIV-2 infected persons were found in this retrospective study. Significant differences in patterns of HIV-1 and HIV-2 WB occurred.

G.521 TRANSMISSION OF HIV INFECTION THROUGH BREAST MILK

Objective. Can breast feeding transmit HIV infection from HIV seroreactive mothers to their children?

Methods. With a view to assess the possibility of perinatal transmission of HIV infection from seroreactive mothers to children besides vertical transmission, 19 HIV seroreactive prostitutes (both by ELISA and Western Blot) and their children were analysed. Group A mothers (2) were asked not to breast feed their children and the latter remained seronegative till 10 months of follow-up. Group B mothers (3) who could not be stopped from breast feeding their children transmitted HIV infection as evidenced by appearance of HIV antibodies in them by 6th, 7th and 8th month after birth. Group C mothers (14) who had breast fed all their children could be analysed only retrospectively. They revealed interesting patterns. The details would be presented.

Conclusion. The high rate of HIV transmission through breast feeding is highlighted.

G.520 HIV INFECTION AMONG DUTCH EXPATRIATES WORKING IN AFRICA
 Houweling, H.M.A.; Van den Akker, E. P.; De Groot, A. J.; Smits, S. P.; Kijlstra, R. J.; Leentvaar, A. J. et al.
 * National Institute of Public Health (RIVM), Bilthoven, The Netherlands.

Objective. To study the prevalence of HIV infection and related risk factors among Dutch expatriates working in sub-Saharan Africa.
Methods. In the course of a routine medical check expatriates who have been posted in sub-Saharan Africa for at least 6 months since 1978 are asked to give a vial of blood and to complete a self-administered questionnaire on sexual, occupational and other risk factors for HIV infection.
Results. Among 1230 participants posted in 39 African countries (Sept. 1987-Dec. 1988) Western risk factors were relatively rare: 18 men (2.8%) were homo/bisexual, 2 men and 1 woman had used i.v. drugs. However, 71 men (10.2%) and 20 women (3.2%) had been treated for S.T.D. Risk factors in Africa included sex with African partners (37% of men, 15% of women; mean 3, range 1-150). Condom use was infrequent and inconsistent. The majority of medical doctors (81%) and nurses (69%) and 32% of nurses had suffered needle stick accidents (mean 1, range 1-150). Four participants were found to be infected (seroprevalence: 0.3%, 95%CI: 0.01-0.7%). 2 men and 2 women: 1 woman had sex with a bisexual man, all 4 had sex with African partners and had been treated for S.T.D., 1 had an African partner and 1 was born in Africa, no one had occupational exposure to HIV.
Conclusion. Despite high prevalence of risk factors HIV infection is rare among a non-selected group of expatriates working in sub-Saharan Africa.

COST OF MEDIAN-TERM AIDS PREVENTION AND CONTROL PROGRAMMES IN SUB-SAHARAN AFRICA

Dreyer, Neil; Collins, L.*; Tarranto, D.*; Lamborg, J.L.**; Gemen, U.**; Phillips, M.***, et al.
*World Health Organization, Geneva, Switzerland, **The World Health Organization, DC, USA, ***University of Geneva, Geneva, Switzerland, ****London School of Hygiene and Tropical Medicine, London, UK.

The globally agreed strategy for AIDS prevention and control calls for the formulation of comprehensive median-term plans which describe the policies, strategies and activities around which government, non-governmental and international agencies will focus their collaboration. Governments and the international community need to know the level of resources required to implement these plans. As very little published data exists on the real costs of implementing AIDS programmes, a study was made by the World Health Organization and the World Bank of budgeted costs of 12 median-term programmes formulated in Sub-Saharan Africa.

The study initially described the main features of the first year budgets and then explored the relationship between cost and several country characteristics with the intention of using this both to predict likely future costs and to extrapolate costs to other countries in the region. This paper provides a discussion of the rationale, the methodology and the results of the study. It points to the need to develop uniform costing guidelines, to collect retrospective expenditure data and to undertake preliminary cost-effectiveness analyses of elements of the plan.

HIV SCREENING AMONG POTENTIAL IMMIGRANTS: A COST/BENEFIT ANALYSIS

Brown, Ronald; M Gilmore, JD Ph.D.; M. Gaudin, A. Dutschak, SA Grover; *McGill University, Montreal, Quebec, Canada, **Queen's University, Kingston, Ontario, Canada.

Objective: To assess the economic impact of HIV screening among potential immigrants to Canada on the national health care system and Canadian community.

Method: We developed an economic model based on current international HIV seroprevalence data, Canadian immigration statistics, disease progression estimates and the projected costs of HIV screening and treating AIDS patients.

Results: Estimating that 139,034 immigrants enter Canada in 1988, between 269 and 471 are likely to be HIV carriers. Screening would lead to the exclusion of between 264 and 566 persons including false positive results. The estimated total cost of screening every immigrant ranges between \$1.7 million and \$4.0 million. The present value (discounted at 7.5 percent) of the medical costs for 48 percent of the HIV carriers who will develop AIDS between 1988 and 1997, ranges between \$6.5 million and \$21.0 million. However, the limited net benefit associated with screening may be significantly offset by additional administrative costs to immigration, loss of desirable applicants, and Foreign Income.

Conclusion: The cost/benefit of HIV screening for potential immigrants remains uncertain given the associated costs which have not yet been determined.

M.H.O.5

COST-EFFECTIVENESS OF HIV SCREENING AMONG PREGNANT WOMEN IN PARIS HOSPITALS

La Caille, Catherine; Oti, Moust J. (1), Colucci, Paris-Tours d'Etude de la transmission HIV périnatale (Paris-Tours Study Group on Perinatal Transmission HIV) (2) INSERM U246, Paris, France

An epidemiologic multicentre study (coordinated by "Centre d'Histopathologie Périnatale", Paris and Service de Virologie, Hôpital Necker, Tours) about perinatal transmission of HIV is currently carried out in Paris region. In this context, between August 1987 and February 1988, HIV screening was systematically proposed to all pregnant women attending in 6 obstetrical clinics in the region (97,820; 2,140 have already been tested for HIV out of 475 known HIV+). Among the 1,660 tests of pregnant women who have never been screened, 18 were discovered HIV+ (total prevalence = 6.95 10⁻³). Under the assumptions of ELISA sensibility (98.5 - 99.2%) and specificity (98.1 - 99.1%) the average cost per additional pregnant woman HIV+ discovered in clinic varies from 2 640 to 6 650.

As women, before being screened, had to answer a questionnaire about risk factors, non-systematic screening based on such factors can be avoided. In this case, only 12.9% of pregnant women would have been tested, the total prevalence would have been 3.6% and the average cost per HIV+ discovered 1 120. With regard to the 3 additional HIV+ pregnant women discovered by systematic screening (compared to non-systematic one), the cost per supplementary HIV+ woman found (average cost) is 2 810.

For the next 6 months of the screening program (February - August 1988, n = 7,750), similar calculations lead to an average cost of \$ 7,360 - 28,800 for systematic screening (6 pregnant women discovered HIV+); and of \$ 1,620 for non-systematic screening (15% of at-risk population, total prevalence 7%).

Results suggest that cost-effectiveness of HIV screening among pregnant women in hospitals is, in fact, highly dependent of efficiency of screening practices in other sectors of prenatal care especially obstetrical medicine (between August 1987 and 1988, the % of women already tested before attending obstetrical clinics varied from 22 to 32%).

M.H.O.6

THE ROLE OF COMMUNITY-BASED ORGANIZATIONS IN CONTAINING THE COSTS OF THE AIDS EPIDEMIC

Smith, Mack D., University of Pennsylvania, Philadelphia, PA, USA

National AIDS efforts have 3 general components: prevention, health and social services, and creation of a supportive social environment. All three are expensive and rapidly-growing financial outlays.

Community-based AIDS service organizations (CSOs), including organizations of Persons With AIDS, have been in the forefront of education and service delivery in the U. S.

One study estimated the value of volunteer services by one CSO in New York to cost over 2 million dollars for 187 slots. A number of areas of work can benefit economically from CSO efforts:

AREA	MECHANISM OF COST REDUCTION
Medical services	Early discharge, home support
Education	Training of volunteers
Client's trials	Publicity, recruitment, retention
Public disputes	Community education, dispute mediation
Prevention	Community education to reduce HIV transmission

CSOs depend on relative fringe government and private support, and their volunteers face fatigue and burnout. In addition, the changing face of the epidemic in the U.S. - particularly the rise in the numbers of minorities and drug-users with AIDS - may make it more difficult to rely on unpaid volunteers. Support for the CSOs themselves is arguably a cost-effective investment for hard-pressed public agencies.

T.H.O.1

WORK DISABILITY AMONG AIDS CLINIC PATIENTS
Creswell, Ruth M.; Tolleter, H.; McIndler, J.; Kuhl, S.; and Pison, M. University of California, San Francisco, California, USA.

Objective: To describe the incidence, prevalence and predictors of work disability among 61 randomly selected AIDS clinic patients.

Methods: A cross-sectional study of medical and work histories which utilized a structured interview survey instrument.

Results: Fifty-nine (97%) of the respondents reported symptoms which are associated with HIV-related illness. Fifty-three (88%) worked prior to onset of symptoms. The mean time between onset of symptoms and interview was 2.3 years. Twenty-seven of the 53 (51%) stopped working during the period of time between onset of symptoms and interview. (51%) during year 1, (20%) during year 2, 30% during year 3, and 31% during year 4. Among the 26 who remained working, the mean work week declined only slightly to 35 hrs. Among the 53 who worked prior to onset of symptoms, hours worked per week declined 52% to a mean of 19. Given the youth of the study population (mean age = 35 years), and assuming that no additional work disability cases occur before retirement at age 65, 62% of the 40 year productive life span (DLS) of this population would be lost. However, assuming that a 10% disability incidence rate continues, the loss would be 48%.

Conclusion: This group of AIDS clinic patients experienced a 51% work disability rate within 3 years of the onset of symptoms. Since hours per week declined only slightly among those continuing to work, most of the lost productivity was due to a complete cessation of work. The incidence of work disability is estimated to result in the loss of 48-62% in the working life of this population.

T.H.O.2

FIVE YEAR AIDS PLANNING PROCESS AT A HEALTH MAINTENANCE ORGANIZATION
Anderson, Elizabeth S.; Thompson, R.L., M.D.; and Berry, W.J. Group Health Cooperative of Puget Sound, Seattle, Washington, U.S.A.

Objective: To provide a basis for resource allocation and planning decisions. Group Health Cooperative (GHC), a large HMO, completed a five-year (1981-1985) service planning process. **Methods:** GHC identified multiple areas where it had AIDS-related responsibilities and issues; and as a provider and coordinating health care services; preventive education; developing and administering insurance packages; as an employer; utilizing clinical and management information systems; and as a partner in community-wide projects. A multidisciplinary planning team gathered data; identified policy issues and resource needs, and forecast future impact. The team used the HMO's data systems and CDC's AIDS case-reporting methodologies to predict future AIDS cases and outcomes.

Results: By year 5 (1985), GHC predicted a 50% increase in AIDS cases. The PWAs, unevenly distributed over the HMO's service area. The direct medical costs of treating PWAs are estimated at \$12.0 million annually. To meet legal mandates and clinical needs over 1989-1991, the PWAs will cause a major impact on future planning for hospital beds, staff, inpatient and outpatient beds, and ancillary services. To meet legal mandates and clinical needs over 1989-1991, the PWAs will increase 3 to 10 times to over 25,000 employees each year, requiring significant additional staff resources. Staff training needs in infection control, clinical management, and case management were identified. A system to coordinate the case and support services for PWAs across settings is needed. Strong ties to community-based AIDS efforts (e.g. prevention and care) and low case rates are factors shown to be useful to health care and the community. The planning team set directions for design and administration of the de IDMO's "benefits package" to support care and treatment of PWAs and other patients with chronic and reduce adverse selection problems. **Conclusions:** Long term service planning provides HMO's with information to allocate resources needed for adequate AIDS treatment, case management, and prevention services, future bed and staffing levels; training; and benefits administration.

T.H.O.3

UTILIZATION OF COMMUNITY-BASED AND HOSPITAL CARE FOR PERSONS WITH AIDS IN SAN FRANCISCO, 1980-85
Stern, Adam L.; Chen, R.; Udell, J.; Frazier, V.; Lifson, A.; Hernandez, M.; Williams, M.; Riddle, R.; Gorman, G. Department of Public Health, San Francisco, CA, USA.

Objective: To assess utilization of community-based and hospital care for persons with AIDS in San Francisco.

Methods: We defined 8 distinct care settings for PWAs and surveyed care providers to determine average daily census of PWAs in each setting during January 1980 and January 1989. Utilization was calculated as a percentage of living persons with AIDS in San Francisco, adjusted for reporting delays.

Results: Of the 2,859 living PWAs in San Francisco in January 1989, 82.2% were living at home without healthcare, 7.8% were receiving healthcare, 4.4% were in residential settings with social service support, 3.8% were in acute care hospitals, 0.5% were in skilled nursing facilities, 0.5% were in mental hospitals, 0.5% were in substance abuse treatment, and 0.2% were in mental health treatment. The distribution of living PWAs in these settings did not significantly change from January 1988 (2,042 living PWAs) to January 1989.

Conclusions: On an average day, most PWAs in San Francisco (82.2%) are currently living at home without healthcare. Only 3.8% of living PWAs are in acute care hospitals. The remaining group of PWAs receive home care or are served in a variety of community-based care settings. As the number of living PWAs in San Francisco is expected to rise to 6,200 by 1992, utilization patterns at all care settings will be critical for health care planning purposes.

T.H.O.4

ASSESSING THE COST OF AIDS TO BOTH PATIENTS AND THE HEALTH CARE INSTITUTION
Pittman-Indiana, M.J.; Miller, D.; Sowa, P.F. San Francisco General Hospital, San Francisco, California and *San Francisco Office of Public Health, San Francisco, California

Objective: To describe and document the cost of AIDS to San Francisco General Hospital.

Methods: The authors review patient medical records to assess a base line of services provided. These services are compared to individual workload monitors (i.e., nurse activity tool; medical record tasks; medical social worker/client hours). The cost is further evaluated by looking at internal service department workload related to HIV patient care. The cost to the hospital in staff hours, materials, supplies and equipment is compared with other overall hospital costs. The cost of AIDS is also considered as an opportunity cost and the authors attempt to quantify the programs which have least support or resources while the hospital staff have directed their efforts to AIDS.

Results: The review of medical records and departmental monitors clearly show that key hospital services are disproportionately involved in HIV care and that those services are typically not part of the billing documents. The paper describes a model that each health care institution can use in evaluating the cost of AIDS care.

Conclusions: The cost of AIDS care must be evaluated from the impact on the individual patient as well as the cost to a health care institution. This paper attempts to quantify these departmental expenses. It also raises the question of the eventual cost to our health care workers. Although this issue is not quantified, it is a crucial factor in assessing the real cost of AIDS.

T.H.O.5

PUBLICALLY-FUNDED COSTS OF COMMUNITY-BASED EDUCATIONAL PROGRAMS BY RISK CATEGORY IN SAN FRANCISCO
Evans, Patricia L.; Herrington, M.; Rutherford, D.W.; Amery, J.W.; Conne, D.; Nguyen, B.; Amery, A.; Wieringer, D.; Department of Public Health, San Francisco, CA USA

Objective: To evaluate publicly-funded costs of community-based AIDS prevention/education program by risk category.

Methods: We reviewed 5 community-based state and city) for the 12-month period July 1987 through June 1988 and categorized funding for 11 community-based organizations (CBOs) according to target populations. We determined per capita expenditures using estimated sizes of specific risk groups. **Results:** Total public funding for the 12-month period was US\$5,751,579. Of this amount, \$1,111,127 (20%) was subcontracted to 11 CBOs according to the following target populations:

Home/bisexual men (including IVUDs)	Total Funding(\$1000)	Per Capita
IVUD	\$1,009 (30%)	\$17.35
Heterosexual*	897 (27%)	74.76
General Public	474 (14%)	4.82
Provider Education	520 (16%)	1.31
GENERAL	125 (4%)	16.60
TOTAL	\$3,311	5.72

*Defined as heterosexual partner of an intravenous drug user or bisexual man or heterosexual with 2 or more partners in last year or no sexual contact with any partner. **Conclusions:** San Francisco's comprehensive educational program includes \$2,360,217(72%) of community-based funding targeted towards high-risk groups and \$30,911(28%) towards the general public and provider education.

T.H.O.6

COMMUNITY-BASED FINANCING IN AIDS: CBO AS MODEL
Stern, Adam L.; Department of Public Health, San Francisco, CA USA

Objective: To demonstrate how community-based costs can represent a successful alternative model for the design and conduct of clinical research in AIDS, expanding the number of study participants and increasing compliance (including minorities and group members) and incorporating the perspective of patients in the research.

Methods: The CBO is organized and approved by the New York State Department of Health to sponsor the longitudinal, multi-center study of seropositive AIDS/HIV seroconverters conducted in a community setting by qualified physicians in cooperation with informed volunteers. Subjects recruited from their neighborhoods throughout the field of AIDS.

Results: Although the CBO has been in existence for little more than one year, it already has 200 approved clinical trials fully approved and underway, as well as 4 other important research studies under way. In addition, the CBO has an informal monitoring project of substance, the results of which will be reported at the 1989 International Conference on AIDS in Seattle. The CBO has also prepared a report submitted for publication on the underactive surveillance in AIDS of low risk levels. Both reports represent evidence of the CBO's ability to collect data to evaluate the effectiveness of its programs. We are prepared to present the procedures for development of research networks from independent support, financial success, and general conduct of based research conducted in an AIDS center.

W.H.O.7

**EMPIRE BLUE CROSS AND BLUE SHIELD:
THE FIRST 7500 AIDS CASES**

Responsible: Jan, Padgug, Robert,
Empire Blue Cross and Blue Shield, New York City, USA

Objectives: To describe the experience of Empire Blue Cross and Blue Shield with its first 7500 AIDS cases, and to draw conclusions regarding health insurance coverage, costs per case and trends in types and sites of treatment.

Methods: Presentation of Empire's policies regarding insurance coverage for AIDS followed by statistical analyses of hospital and medical claims data for persons with AIDS insured by Empire.

Results: Lifetime health care costs for persons with AIDS covered by Empire are approximately \$60,000 per case, significantly below many early cost estimates. Costs have been stable through the course of the epidemic because of a decline in inpatient utilization.

Conclusion: Costs for the treatment of persons with AIDS are manageable, even when the number of cases is large and there is easy access to health care providers. Results should be useful for private insurers, governmental bodies, and other institutions concerned with trends in costs and with insurance coverage issues.

W.H.O.9

**THE COST OF HIV-RELATED HEALTH INSURANCE CLAIMS
IN THE UNITED STATES**

Responsible: Charles, Health Insurance Association of America, U.S.A.

Objectives: To present data on the cost of health and disability insurance claims related to the HIV epidemic for 1978 and 1987. (Data for 1988 may be available by the time of the conference.)
Methods: Each year since 1986, the Health Insurance Association of America and the American Council of Life Insurance have surveyed their members to collect data on claims related to HIV illness. Although not all HIV-related claims are identified, this survey provides the best estimate currently available of the HIV-related costs paid by insurance companies.

Results: The percentage of claims related to HIV illness is small, but increasing rapidly. There is wide variation in impact among companies, with a substantial number of companies experiencing no HIV-related claims, while others report more than 4 percent of claims related to HIV illness.

W.H.O.8

**HEALTH INSURANCE INDUSTRY MODELING OF THE
EPIDEMIC IN THE UNITED STATES**
Responsible: Dinius, J.**, Health Insurance Association of America, *Atlanta Life and Casualty, U.S.A.

Objectives: To present the results of a model developed jointly by the Health Insurance Association of America and the American Council of Life Insurance.

Methods: A joint committee of the two trade associations developed a model for forecasting AIDS cases and claims costs through the year 2000, using a range of scenarios. This presentation discusses the assumptions, methodology and results of this modeling effort.

W.H.O.10

ANALYSIS OF AID ASSISTANCE PROVIDED BY A PRIVATE HOSPITAL

Responsible: Claxton, M.; Houtis, J.; Nelson, J.; St. Clare's Hospital and Health Center, New York, NY, U.S.A.

Objective: To identify gaps in third party coverage of AID

Methods: Analyzed free distribution of AID during six months at St. Clare's Hospital, NY, to various financial classifications in relation to: 1) date Retrovir available for purchase; 2) dates of various stages of progression of governmental AID Drug Assistance Program (ADAP); 3) date assistance effective to individuals; 4) date patient first aware of assistance.

Results: Seventy-three patients were given 45,868 AID capsules, cost approx. \$74,765. Breakdown of capsule distribution as follows: Medicaid eligible, patient not notified by govt.; 241. ADAP eligible, no action taken by Fed. Govt.; 51. ADAP eligible, application not available; 161. ADAP eligible, program not implemented; 51. Covered by private insurance, unable to afford out-of-pocket outlay; 131.

Conclusions: Non-governmental agencies must be aware of bureaucratic delays in providing governmental assistance for new drugs and that patients are often unable to meet out-of-pocket expenses necessary with private third party coverage. These agencies must implement mechanisms to ensure interim assistance is available.

W.H.O.11

**NATIONAL SURVEY OF STATE SPENDING FOR AIDS PROGRAM
ACTIVITIES**

Responsible: Ryan, C.C.; Krutz, R.M.*; and Merritt, D.M*,
Richard, J., Madson, S.* and Parvill, K.W.*
*Intergovernmental Health Policy Project/The George Washington University,
Public Health Foundation, *National Association of State Budget Officers,
Washington, D.C. U.S.A.

Objective: To report on findings from a 50-state survey of 1989 state appropriations for AIDS (funding (non-Medicaid) across all state departments and by program area. Methods: A pre-conference questionnaire was distributed to a Governor's designated sample of state budget officers and health officials, with assistance from related organizations. Results: Preliminary survey results show that states are appropriating funds to a variety of state agencies besides health, including those in corrections and education. Total state-only funding (non-federal) for AIDS has increased by at least a third from the previous fiscal year. Almost four-fifths of the states have appropriated funds from their own general revenues. Those with no state funding continue to rely on federal grants primarily for public health activities. AIDS has changed the source of support for public health activities, with the private sector directly funding service programs sponsored by state and local governments. The findings document the shift in AIDS funding for specific program activities and demonstrate the amount of state and federal funds passed through to local governments and community based organizations. Conclusions: Federal funding will continue to influence how states fund their own health. States are using state funds to develop model programs for service delivery, planning and outreach to special populations.

W.H.O.12

**FINANCING THE MEDICAL COST OF THE HIV EPIDEMIC
IN THE UNITED STATES: A POLICY REVIEW**

Responsible: Barry, J.; Saaga GPN*; Thorpe KEE; Pinsherg WPN*,
* Center for Policy and Education, Harvard AIDS Institute, Harvard School of Public Health,
** Department of Health and Hospitals, Boston, MA, U.S.A.

Objective: To review strategies to provide access to care to people with HIV infection in a country without universal health insurance.

Methods: We use explicit criteria to evaluate use of policy options to provide increased access to care for those with HIV infection in the United States. The options include: Use of state risk pools and provider malpractice, employer mandates, and expansion of public financing programs, Medicaid and Medicare.

Results: The complex health care needs of persons with HIV infection highlight inadequacies in our fragmented health care financing systems and raise serious questions concerning how best to pay for care. While the total cost of caring for an individual with AIDS is similar to the cost of caring for those with other catastrophic illnesses, these costs do have a significant impact on both affected individuals and regions of the country that have been hard hit by the epidemic.

Conclusions: We recommend approaches to broaden the available continuum of care through improved financing mechanisms. In order to provide more universal access to care, we recommend changes that will extend eligibility for private insurance among the previously unemployed, extend Medicaid and Medicaid coverage, and establish state funds for the uninsured.

M.H.P.7

THE CONTRIBUTION OF PCP TO TRENDS IN AIDS HOSPITAL DISCHARGES AND AVERAGE LENGTHS OF STAY.

Stevens, Sandra R.; Struchiner, F.; Rutherford, G.;

Basket, L.*; Hays, R.*; Department of Public Health, San Francisco, CA; *West Bay Hospital Conference, San Mateo, CA, USA.

Objective: To evaluate the contribution of *Pneumocystis carinii* pneumonia (PCP) to declining average lengths of stay (ALOS) and decreasing average daily census (ADC) of hospitalized AIDS patients in the San Francisco Metropolitan Statistical Service Area (MSA).

Methods: We compared acute hospital discharges and average lengths of stay (ALOS) for AIDS patients discharged with a primary diagnosis of PCP and those discharged with other AIDS-related diagnoses from 1984-1987. Discharge data included are non-Federal acute-care hospitals in San Francisco, San Mateo, and Marin Counties.

Results: The contribution of PCP to all AIDS discharges did not change from 1984 and 1987 but the ALOS of patients with PCP decreased more rapidly than ALOS patients without PCP.

	1984	1985	1986	1987
Discharges, % PCP	30.3	35.8	32.3	34.1
ALOS, PCP	16.2	12.9	13.7	12.3
ALOS, non-PCP	10.6	11.6	11.5	9.8

Conclusions: The decreasing ALOS and ADC for hospitalized AIDS patients in San Francisco MSA can be primarily accounted for by shorter ALOS for PCP patients.

M.H.P.8

COSTS OF HOSPITAL CARE FOR PATIENTS WITH HIV INFECTIONS

Boroff, Jan C.C.; Jager, J.C.; Geels, R.M.A.;

Long, J.L.C.; Misch, C.F.; University Hospital Utrecht, The Netherlands and *National Institute of Public Health and Environmental Protection, The Netherlands.

The implications of AIDS for health care are unknown. Precise data on the utilization of health care facilities and the related costs, and efficiency and effectiveness of hospital care are not available, mainly due to the absence of suitable methods for registration of demographic, medical and financial data of individual patients in hospitals. For this reason we developed a system which enables a detailed collection and analysis of data. The application of this system to six patients with HIV infections treated in our hospital between January 1, 1987 and July 1, 1988 showed that the mean yearly costs of in- and out-patient treatment of a patient with AIDS (CDC IV) were \$ 20,000; those of treatment of patients with other HIV infections (CDC I-III) ranged from \$ 1,700 to 2,500. Comparison of the mean costs for patients who died in that period with those of patients who did not, revealed that patients deceased because of AIDS would have costed \$ 40,000 yearly and those with AIDS who were alive at July 1, 1988 \$ 15,000. These figures only concern costs of hospital care for these patients. Other costs, such as those of procedures for prevention of HIV transmission, are not included. In the time of the conference the data will be updated. In addition, underlying diagnostic activities and treatment patterns will be described.

M.H.P.9

HOSPITAL USE BY A POPULATION-BASED COHORT OF AIDS PATIENTS

Hudson, James J.; Mosenifar, K.; Klockner, R.; Bennett, D.; Fleming, D.

Oregon Health Division, Portland, Oregon, U.S.A.

Objective: To accurately determine statewide hospital use among AIDS patients by following all cases in a statewide, population-based cohort.

Methods: We follow all AIDS cases identified by active AIDS surveillance in Oregon who remain in the state for follow-up medical care. At six month intervals, we review each patient's medical record and abstract information about every hospitalization requiring at least an overnight stay.

Results: Records were available for 381 (94%) of the 407 Oregon AIDS cases diagnosed between 1/181 and 6/30/87. During the cumulative 3,965 case-months of follow-up, there were 103 hospitalizations. 83% of all ICU days occurred within the first 6 months of diagnosis. Among all patients, the median number of days spent in the hospital during the year following diagnosis has remained constant at between 7 and 8 from pre-1983 through 1986. By 12/88, 240 (63%) of the 381 patients had died. The total hospital days among cases that had died averaged 80. This total was unaltered to length of survival after diagnosis by linear regression (total hospital days for those surviving 1-3 months, 26 days; 4-6 months, 23 days; 7-9 months, 19 days; 10-12 months, 20 days; 13-18 months, 22 days; 19-24 months, 25 days; more than 24 months, 34 days). The percent of time spent in the hospital was inversely associated with length of survival (1-6 months, 53%; 7-12 months, 42%; > 12 months, 5% ; p<0.001 by linear regression).

Conclusions: In this cohort of AIDS patients, hospital use has been constant over time. Admissions have been short and relatively infrequent. Contrary to expectations, increased length of survival has been associated with more hospital-free days rather than more hospitalizations.

M.H.P.10

OUTPATIENT TREATMENT OF AIDS: A VIABLE ALTERNATIVE TO DECREASED HOSPITAL CARE COSTS

Lichten, Richard; Malmgren, P.; Mizolzi, A.; Bertoni, J.A.; Dale

University Medical Center, Durham, North Carolina, U.S.A.

OBJECTIVE: To compare the per diem charge of inpatient vs. outpatient treatment of AIDS patients with an opportunistic infection.

METHOD: Twelve patients were grouped according to opportunistic infection with a classification of inpatient/outpatient, PCP (1 inpatient/7 outpatient), P22 (1 inpatient/2 outpatient), wasting (1 inpatient/7 outpatient), lymphoma (1 inpatient/1 outpatient), toxoplasmosis (1 inpatient/1 outpatient). Hospital days and inpatient charges per admission, and outpatient charges and charges per visit were collected over eight months. Average inpatient and outpatient per diem were calculated. The additional patients will be added as charges are posted and billed.

RESULTS: Average inpatient per diem for PCP was \$1023 ± 18 hospital days. Average out-patient per diem was \$117 ± 33 clinic for home health visits. CPK averaged a \$615 inpatient per diem ± 113 hospital days. Outpatient averaged 30 clinic for home health visits per diem of \$242. Average inpatient per diem for wasting was \$699 ± 31 hospital days. Out-patient cases averaged 17.5 clinic for home health visits at \$147 average per diem. Lymphoma was \$911 inpatient per diem ± 37 hospital days. Outpatient was \$214 per diem ± 34 clinic for home health visits. Toxoplasmosis averaged a \$584 per diem ± 8 hospital days. Outpatient averaged \$83 per diem ± 6 clinic for home health visits.

CONCLUSION: Our data show that individuals with complications of AIDS have very different clinic costs and per diem charges at home and in the hospital. Preliminary data strongly suggest that outpatient therapy for these complications can be administered, per diem charges can be substantially reduced. These preliminary findings warrant further study, and have profound implications for health care policy development.

M.H.P.11

LA FRAUDAZIONE OSPEDALIERA: LE VIE AL VINCO DE

NEOLOGICHE ANCHE IN UN

OSPEDALE DI UN PAESE SVILUPPATO

Chenot, D.; Chelvar, P.;

Ministère de la Santé, de la Famille et de la Protection Sociale, Paris, France *Direction du Plan - Assistance Publique de Paris, Paris, France

OBJECTIVE: Mesurer un jour double l'activité hospitalière liée aux patients infectés par le VIH et au suivi l'évolution des cas.

Methodes: Une enquête nationale transversale semestrielle recense "un jour double" les patients déjà connus comme infectés par le VIH) en fonction de leur statut de la semaine 22 en fonction du type de recours aux soins.

RESULTS: 11 patients recensés asymptomatiques forme sérologique SIDA précoce

9 décembre 1987 1 280 335 378 405

6 Juin 1988 1 280 335 378 405

De décembre 1987 à Juin 1988 l'augmentation totale des cas présents est de 56. Elle porte sur les SIDA sévères (2 202), les formes sévères restées stables et les formes asymptomatiques diagnostiquées de 135. La diffusion des malades sur le plan géographique est très faible (70% des malades concentrés aux deux régions de la Champagne-Normandie, reste stable). Deux malades sur trois sont hospitalisés (80% des SIDA) les autres sont en soins ambulatoires.

L'évolution observée porte sur l'hospitalisation de jour (45% des formes sévères), 84% des patients ont recours aux services de médecine générale et de spécialités médicales.

Conclusion: La répétition structurelle de cette enquête fournit d'importantes informations pour apprécier l'impact de la typologie de soins par le statut de l'infection à VIH et adapter les structures de soins en fonction de son évolution.

M.H.P.12

MEDICAL CHARGES AND HEALTH CARE UTILIZATION FOR PRIVATELY INSURED PATIENTS WITH HIV DISEASE IN CALIFORNIA

Ortiz, Mag.; Brown, RB; Meach, S.J. and Hanks, J.

University of California, San Francisco, USA; Kaiser Foundation Health Plan, Eureka with Blue Cross of California, Oakland, California, USA; Blue Cross of California, Oakland, California, U.S.A.

OBJECTIVE: To develop methods for identifying patients with HIV disease through insurance billing codes and to describe their need and estimated lifetime charges and distribution of health services utilization.

Methods: A major claims file of Blue Cross of California was reviewed for HIV diagnosis from 1984 to 1988. Charges and utilization were analyzed for those with specific HIV diagnostic codes and for those with presumed HIV manifestations including specific signs, symptoms, and laboratory criteria. Kaplan-Meier lifetime cost estimates were also generated for all diagnostic groups except AIDS.

RESULTS: Of the 274 subjects identified, most were men (93%); 57% were male. Mean follow-up was 31 months, with 68% alive at study completion. Forty-three had PCP. Mean charges were \$19,000 for services to \$52,000 for those who died. The deceased were in hospital 3 times longer than survivors (29 days v. 10 days); their estimated lifetime charges were \$79,000. Among all patients, hospital charges represented 67% of the total bill. Among those hospitalized, the highest charges were room and board. Among those not hospitalized, the highest charges were inpatient PCP, pharmacy charges increased from 9% for those diagnosed in 1984 to 20% for those diagnosed in 1987. Among the deceased, 11% of total charges occurred in the last 6 months of life, 66% within the last 3 months. Inpatient variables associated with higher medical charges for all patients included: death, PCP diagnosis, length of follow-up, and hospital days. Last year of follow-up was associated with higher charges.

Conclusions: Identifying persons with HIV disease through insurance billing systems and estimating potentially needed in hospital based reports or those relying on patient recall. We report charges comprehensively low for survivors. Due to the long survival period of HIV disease, the impact of the importance of reporting completed or true lifetime charges (true diagnosis used death rather than observed charges which include patients still alive). Unlike prior results from California, significant differences in charges are not explained exclusively by different hospitalizations patterns or care.

**Repercussions économiques de SIDA
The Economic Impact of AIDS**

T.H.P.7

**SCATTER AND VERSUS CLUSTER HIV TREATMENT OF AIDS
IMPACTS.** *Clair D. Strain J., Faba R., Sacks S.*
The Mount Saint School of Medicine, NYC, USA.

Objective: The Presidential AIDS Commission commented on the need to compile data from dedicated AIDS units and those using scattered placement with regard to quality of care and outcome. Many hospitals are converting beds to an AIDS unit to meet the needs of cost and benefit analysis. This preliminary study describes the outcome and charges of AIDS Unit (Cluster) and Scatter HIV Impact.

Methods/Results: Cluster (n=23) versus Scatter (n=27) patients were studied over the Mount Saint Hospital in NYC using the Utilization Information Service database over a 3 month period. Cluster patients were more likely than Scatter inpatients to be female (74.6%), have more comorbidities (p<.01), stay 225 (range 100-300) hospital (p<.01), and have higher charges (p<.05) (mean: \$9,422 vs \$6,493), and services - \$9,976 vs \$7,720). No differences in age, race, insurance, number of previous hospitalizations, completed infections, death rate, and discharge how were observed.

Conclusion: This preliminary study observed a significantly prolonged hospital stay and increased charges for Cluster patients compared to Scatter patients. Without significant differences in mortality and disability, home, Postoperative, and non-effectiveness studies of Scatter vs. Cluster units are required.

T.H.P.8

The Economic Impact of Early Intervention in HIV Disease
Patric Amos, Sharon D.F., Siegel N.M., Franks P., Lee P., Montefiore Med Ctr, Bronx, NY, USA, *Muhlbach, Chapel Hill, USA, Montefiore, CA, San Francisco, USA*

Objective: To assess the economic impact of providing early intervention services in HIV disease.

Methods: The prerequisites of an early intervention strategy were assessed. The number of individuals requiring early intervention was determined for New York, San Francisco, and the United States. The economic costs for requisite services, including HIV-antibody testing; serologic monitoring; counseling; drug treatment; and primary medical care were estimated. Results: Median estimated costs of early intervention beginning each year 1980-1991 (expenditures in millions of dollars)

	1988	1989	1990	1991
United States	4,078	3,070	3,602	3,200
New York City	627	595	567	531
San Francisco	66	82	75	67

Conclusion: There is a "window of opportunity" for effective early intervention in HIV disease because the majority of infected individuals are approaching the asymptomatic phase of illness. Planning for its implementation should begin immediately.

T.H.P.9

PATIENT PREFERENCE AND SATISFACTION WITH AIDS SERVICES

*Fitzsimons-Indiano, Margi; Miller, D.; Hernandez, S.; Resse, A.**

Department of Public Health, San Francisco, CA USA - *University of California, San Francisco, U.S.A.

Objective: To evaluate the accessibility and quality of services available to persons with HIV infection in San Francisco in order to plan for future needs.

Methods: The authors will utilize a questionnaire and follow-up phone interviews with a sample of persons receiving one or more HIV-related services in San Francisco. Recruitment of persons to respond to the questionnaire will be 1) persons utilizing services at SFHC or other Department of Public Health service sites including substance abuse programs serving PWAs, will be asked to volunteer and 2) an ad will be placed in local newspapers. The initial questionnaire will be closed-ended questions pertaining to prior utilization of services, housing and support, perceived gaps of problems with services, preferred type of service provider, source of insurance/payments, socio-economic data, and level of disability. The survey will be pretested with both providers and persons with HIV infections.

Results: Discussions about the long term needs of PWAs for planning purposes has indicated that the patient's opinion may vary from that of the patient. In some cases we believe that this may be due to a lack of information about the service and its availability. Some services have not been successful due to a lack of support from the person with AIDS.

Conclusion: In order to meet the needs of PWAs in the future in San Francisco, it is necessary to gather the direct input from persons utilizing the services. This information will ensure a responsive system of care.

T.H.P.10

HOSPITAL COSTS AND DRG REIMBURSEMENT FOR HIV ADISSIONS.

Ellis, Zilber, Heide, D., Perez, G. Johnson, E.S., Perez, E. Saint Michael's Medical Center, Newark, New Jersey, U.S.A.*

Objective: To determine impact of DRG system and admitting charges on hospital reimbursement for HIV admissions.

Methods: Retrospective review of 1987 admissions coded as HIV disease. Total admissions listed as self-payers studied in detail as well as admitting service.

Results: Total of 326 patients comprised 403 admissions. Of these, 310 were listed as self-payers. 70% of admissions were to the Infectious Disease Service. Of the 110 self-payers, 643 not able to reimburse the hospital. This resulted in a \$331,423 loss to the hospital. Only 13% of the Infectious Disease Service admissions with a Case Management System failed to reimburse as opposed to a 33% rate in the Medical Service group. Most of these latter admissions were emergency in nature.

Conclusion: Although losses occurred in the self-payer category, these can be minimized by prior infectious diseases and Case Manager involvement with a decrease in emergency type admissions.

T.H.P.11

SHIFTING TOWARDS AMBULATORY CARE OF AIDS PATIENTS - LESSONS FROM THE PCP EPIDEMIC.

Lange, J., Hershberg, R., Mahesh, L. and Ruedi, A. AIDS Research Program, St. Paul's Hospital, University of British Columbia, Vancouver, BC, Canada.

OBJECTIVE: To describe the successful shift towards ambulatory care of patients with AIDS-related PCP. **METHODS:** Data was obtained from the Health Department and the Metropolitan Laboratory Services records at St. Paul's Hospital (SPH). The following variables were collected on a quarterly basis for 2 year period ending March 31, 1987.

1. Number of AIDS-related PCP cases diagnosed
2. Number of AIDS-related PCP cases admitted to hospital
3. Length of hospital stay of AIDS-related PCP cases.

RESULTS: The number of PCP cases diagnosed at SPH increased steadily from the from the 2nd quarter of 1986 (56/2) to the 3rd quarter of 1987 (17/3). Over 17.3% cases. Hospital utilization for PCP cases followed the same pattern (from 273 to 276 hospital days). At this time, a major effort was undertaken to encourage a shift towards ambulatory care of AIDS patients. This was generally facilitated by the opening of an HIV dedicated ambulatory care facility in mid May 1987 and specifically in the use of PCP, by the introduction of a new antipneumococcal, the wider use of PCP prophylaxis and the availability of hospitalization. Although SPH continued to care for over 70% of all AIDS cases in the province, the number of PCP cases admitted at 22 per quarter. Approximately 20% of them were successfully treated on an outpatient basis while the rest required hospitalization for varying periods of time. As a consequence, the hospital bed occupancy for the last 3 quarters of the study, dropped from 220 to 200 per quarter. Average length of stay per diagnosed case of PCP also decreased from 16.6 days (86/7) to 17/7 (for the period to 11:20 days for the last 3 quarters of the study).

CONCLUSIONS: The present study demonstrates the feasibility for implementation of ambulatory care programs for specific groups of AIDS patients. This lesson from the PCP epidemic should be expanded to aid in the shift towards ambulatory care of AIDS patients.

T.H.P.12

HEALTH CARE COSTS OF CLASS 4 REVA CRT IN HOME SETTING

Anderson, Kathleen G.; Shelds, A.; Reva, T.; Mehler, M. Ch. Y.; Thompson, L.L.
Group Health Cooperative of Puget Sound, Seattle, Washington, U.S.A.

Objective: To identify the health care costs and service utilization patterns with CDC Class 4 HIV conditions from January 1987 to June 1988 at Group Health Cooperative (GHC), an HMO with comprehensive medical coverage.

Methods: A database tracking utilization and revenue costs was used to identify all patients in a sample of 13 homosexual/bisexual males (age 38 mean) with CDC Class 4 HIV disease from January 1987 to June 1988. 86% (71) had an AIDS diagnosis; 14% (12) had other Class 4 HIV conditions. All 83 had a total of 1177 contacts with the health care system. 89% (77) received AZT all or part of the time. Results were compared to age and sex matched control sample randomly selected from all GHC enrollees.

Results: GHC's estimated annual costs for all services are \$211,139/person. In the AIDS sample, \$640 for the control sample and \$1,032/person for all GHC enrollees. In the HIV sample, costs were 55% inpatient, 7% primary care, 16% specialty care, 15% outpatient pharmacy, 4% laboratory, and 5% other. Assuming a survival range of 18 to 24 months, a range of diagnosis-to-death costs for PWAs is estimated at \$31,700 to \$42,200. Average length of hospital stay was 10.5 days (with a mean of 140 days) comparable to the Washington State average of 11 days. GHC's primary care MD's manage HIV cases with specialty consultation when needed. Primary care visits are 11 times greater than in controls. Eight specialties (infectious disease, pulmonary, oncology, radiology, therapy, dermatology, ophthalmology, E.R. medicine, and surgery) were utilized to a greater extent than primary care.

Conclusions: Accurate information about the costs of AIDS care and utilization profiles are powerful tools for HMOs and hospitals to use in budgeting manpower and bed projections and long range planning, particularly when coupled with estimates of future caseloads.

* Reported by post to the National AIDS Director, Department of Health, Ottawa, Canada.

The Economic Impact of AIDS**

T.H.P.19 **MEETING THE NEEDS?**
Cooper, Jonathan, Director of Programmes, United Kingdom, Haemophilia Society, WINDLE KINGDOM

Objectives: To assess the needs of people living with HIV and examine financial provision made by the State for individuals and their carers.

Method: The weekly living costs of people with symptomatic HIV infection were assessed. An investigation of need compared to existing state benefits was made. Benefits examined were income related, non-contributory and non-contributory based.

Results: Personal needs per week for single person living with AIDS under 25 years old, on top of regular living costs = 65.22 Pounds.

Income Related Benefits Available:
Income Support - 13.05 Pounds
Non-Income Related Benefits Available:

Mobility Allowance: 23.05 Pounds
Attendance Allowance: (Lower rate) 22.00 Pounds
Invalid Carer Allowance: 24.75 Pounds
Invalidity Benefit: 41.15 Pounds

Severe Disablement Allowance 24.73 Pounds
Conclusion: The only benefits in the U.K. applicable to meeting the needs of people with symptomatic HIV infection is the 13.05 Pounds Disability Premium. This premium is only available to those with no or virtually no income. As well as being inadequate the premium also has a qualification period

T.H.P.20 **ACCESS TO INSURANCE AND PERCEIVED DISCRIMINATION BY HOMOSEXUAL MEN**
Kane, Nancy, Johns Hopkins University, Baltimore, Maryland, U.S.A.

Objective: 1) To compare access to health life and disability insurance among homosexual men who are seropositive, seropositive or have AIDS; 2) to compare perceived discrimination in employment and in medical/dental treatment.

Methods: Self-administered questionnaires were distributed to Baltimore and Los Angeles MACS participants between October 1987 and December 1988. Questionnaires also were distributed to supplemental samples of AIDS and subacute patients (the latter as a comparison group) at the Johns Hopkins Hospital.

Results: Analysis of the first 288 of 1900 subjects revealed the following results:
Baltimore N=1,448 Los Angeles N=100 % HIV+ AIDS

Has any health insurance
or Medicaid

90%	80%	100%	90%	90%	70%
-----	-----	------	-----	-----	-----

Was asked about previous HIV testing or required to be tested by insurance company

4%	6%	-	2%	5%	10%
----	----	---	----	----	-----

Asked about health insurance
type for being gay

3%	12%	-	8%	10%	11%
----	-----	---	----	-----	-----

Discriminated by a doctor or dentist

4%	9%	-	0%	10%	30%
----	----	---	----	-----	-----

Conclusions: Persons with AIDS are more likely than seropositive or seronegative persons to be uninsured, to have been turned down for health insurance and to have been refused medical or dental treatment. Seropositive perceive more discrimination by doctors and dentists than do seronegatives.

T.H.P.21 **COSTS OF HOSPITALIZATION FOR AIDS PATIENTS AT A COMMUNITY HOSPITAL IN CONNECTICUT**
Lynn, Robert W., Medford, G and Costanzo, R. St. Francis Hospital and Medical Center, Hartford, Connecticut, U.S.A.

Object: To determine the cost of in-patient care for patients with AIDS (PWA) at community teaching hospital in the northeastern United States in fiscal year (FY) 1988.

Methods: All PWA admitted are known to the Infectious Disease department. Detailed billing records of all PWA admitted from 10/1/87 to 9/30/88 were obtained from accounting department.

Results: 51 PWA had 108 admissions. The average length of stay (ALOS) per admission was 13.7 days. (The ALOS for all 23122 admissions in FY 1988 was 7.5 days).

The cost for PWA was \$379,462 - \$8,143/admission or \$17,744/PWA/year. The largest cost was for room, \$473,199, and includes \$11,480 for 10 admissions totaling 210 days as in ICU. Laboratory costs were \$126,782.

The total reimbursement received was \$434,140 for a loss of \$44,331 - a loss of \$412/admission or \$8727/PWA/year. Reimbursement sources are shown:

Source	No.	Payments	Per/diem	Loss
State Welfare	64	124,208.66	2097.79	36,173.28
City Welfare	17	62,086.66	3653.36	61,404.33
Insurance	20	31,968.25	8090.09	24,031.56
Self Pay	3	21,094.63	7068.21	(8,957.79) gain
FMGO	4	54,307.00	13,626.75	1,246.26

Conclusions: As the number of indigent PWA increases the financial burden on community hospitals will become unbearable unless more money is allocated for patient care and more out-patient facilities are developed.

T.H.P.22 **HOW DO PERSONS WITH SYMPTOMATIC HIV DISEASE FINANCE THEIR CARE IN TEXAS**
Crane, Martha, "Infectious D", Miles A*, Jarolim L*, 30365SD 75474

*University of Texas Health Science Center at Houston, Texas, U.S.A.
**Southwest Texas University, San Marcos, Texas, U.S.A.

Objective: To determine utilization of medical and social services and payment by persons with HIV infection in the State of Texas.

Methods: An anonymous self-administered survey of HIV-infected persons in selected urban areas of Texas was undertaken in fall 1988 at the request of the State Legislative Task Force on AIDS. Participants identified through physicians, AIDS service organizations and other care providers were given surveys that were mailed back either to the investigators or the Task Force office. Forty percent (40%) of those distributed were returned.

Results: Respondents included 71 asymptomatic (65), 81 symptomatic (53) and 287 AIDS patients. All AIDS patients had seen a physician at least once in the three months prior to the survey (avg 7.0 visits) and 41% had been hospitalized. There was heavy utilization of dentists and various counseling services. Between the time of first HIV-related diagnosis and the survey, the proportion of employed AIDS patients decreased (from 83% to 23%); as did the proportion with private insurance (from 60 to 41%); the proportion relying on public and indigent care exclusively increased (from 8 to 21% and from 5 to 21% respectively). Of AIDS respondents, 33% had spent all their savings on their illness and 44% were unable to pay for prescription drugs. A similar pattern was present for 53 respondents.

Conclusions: As illness progresses, an increasing proportion of once prosperous persons are forced on the indigent care system in Texas.

T.H.P.23 **HEALTH INSURANCE STATUS AND THE UTILIZATION OF HEALTH SERVICES BY A COHORT OF IV DRUG USERS**
Bolton, Lisa, Frank R, Coleman D, Vishaw B, Cobb S, The ALIVE Study, The Johns Hopkins School of Hygiene and Public Health, Baltimore MD, USA

Objective: To identify the patterns of health service utilization and the financing of outpatient health care services in a population of HIV positive and negative IV drug users (IVDU).

Methods: A cohort of IVDU, recruited into a natural history study of HIV infection were interviewed to determine the type of health services used, and the means of financing these services. Persons with AIDS were excluded from recruitment. Correlations between HIV serostatus and type of insurance were examined.

Results: Among the first group of 805 respondents, 84 (21%) were HIV positive (HIV+ and 80 confirmation). Forty-three percent of the study population had at least 1 outpatient visit within the past six months.

Sixty-three percent of these visits were hospital based. Nine percent had a hospital admission. Presently 88% of the population is covered by Medicaid. Medicaid coverage did not vary by serostatus.

Conclusions: The numbers of HIV positive IVDU who do not have insurance suggests additional planning for an increasing Medicaid population if indicators. Further, this population's preference for using hospital based facilities, frequently emergency rooms, will continue to burden these facilities and be costly to the system.

T.H.P.24 **THE SHARE OF AIDS MEDICAL CARE COSTS PAID BY PRIVATE INSURANCE IN THE UNITED STATES**
Katz, Charles, Health Insurance Association of America, U.S.A.

Objective: To assess the merit of alternative sources of data on the distribution of AIDS medical costs among various payers in the United States.

Methods: The most widely cited estimates of payer shares were those developed by Andrus, et al, based on surveys of public and teaching hospitals, and estimates of the Medicaid share developed by the Health Care Financing Administration. However, data from the National Hospital Discharge Survey, and data from local hospital associations appear to conflict with these widely cited estimates. This presentation reviews the strengths and weaknesses of all of these data, in an effort to identify the best estimate of payer share and the degree of uncertainty attached to it.

Session d'affichage Poster Session

Répercussions économiques du SIDA The Economic Impact of AIDS

Pays en voie de développement Developing Countries

W.H.P.1 COSTS OF TREATING AIDS PATIENTS IN AFRICA
Makins, Mary; Wong, H. Abt Associates Inc.,
Washington, DC, United States.

Objective. To assess the direct costs of treating AIDS patients in Africa and to determine patterns of treatment of the disease.

Methods. A methodology has been developed to estimate the direct costs of treating AIDS patients at selected health care facilities in African countries and to obtain information about the indirect costs of the disease to the patient population. Such retrospective studies have the advantage of being fast and inexpensive compared to prospective studies, and will provide important baseline data as a foundation upon which future studies can be built. Data will be collected on initial and subsequent diagnosis, number of visits and admissions to health facilities, length of stay for admissions, and costs of providing health services in the facilities. This information will be obtained from patient records, salary histories, and investigation at health care delivery sites. A questionnaire will be administered to the sample population to estimate the costs to the patients of treating the disease outside of the health care facilities, including charge per visit, charge per hospital stay, and charges for drugs.

Results. Information will document the magnitude and incidence of the costs required to treat the disease.

Conclusion. Such a methodology will help decision makers to weigh the costs of treating the disease against the costs of treating other patients; to develop cost effective treatment protocols; and to prepare for the anticipated growth of the epidemic.

W.H.P.3 DIRECT MEDICAL COSTS OF AIDS IN LATIN AMERICA AND THE CARIBBEAN: MORE COST-EFFECTIVE MODELS
George Gagliardi, Y. Koum*, F. Zaccaria**, D. Shepard***,
S. Zetomayor*, San Juan AIDS Institute, San Juan, Puerto Rico **Harvard Institute for International Development, Cambridge, MA ***Pan American Health Organization, Washington, DC ****Harvard School of Public Health, Boston, MA, U.S.A.

Objective. To describe, compare and analyze the estimates of the direct medical costs of AIDS patients available to present in Puerto Rico, Dominican Republic, Mexico, Costa Rica, Brazil and Argentina, and to analyze the policy issues related to the respective health care delivery systems.

Methods. A compilation and comparison of all costs related to out-patient and in-patient care for AIDS patients available from official sources of the six countries, was followed by an analysis of how these costs related to the respective systems for financing and delivery of medical care.

Results. The availability of different types of services varied among countries. Length of hospital stay, costs per patient per year and share of hospital cost in the total cost of services, when comparable, were significantly higher in those places where treatment was mainly hospital-based and a comprehensive approach was not available.

Conclusion. A comprehensive system of health care including ambulatory, extended, home and hospice care provides a more cost-effective approach to the management of AIDS patients and may be applied in other LDC nations. Cooperation among nations to share their experiences in developing cost-effective models to contain the costs of AIDS and to maximize the utilization of available resources should be promoted.

W.H.P.5 Economic Analysis of AIDS in Puerto Rico
José J. Alameda-Lezand*, Alfredo González-Nortea**
Assistant Professor of University of Puerto Rico at Mayaguez,
*Professor of University of Puerto Rico at Mayaguez

The authors attempted to assess AIDS epidemic from the economic point of view. Specifically, they determined whether the economic burden of the disease is heavy. It should be pointed out that Puerto Rico depicts high levels of AIDS prevalence rate as compared with other Latin American island Republics during the fifty states. The ratio between the Latin American countries only Brazil) surpassed the number of cases per million inhabitants in Puerto Rico.

The estimated economic costs consist in two main categories: Direct costs and indirect (implicit costs). The direct costs include medical care and research & education expenditures. Indirect costs include the income losses due to illness and disability (morbidity) as well as present values of future earnings lost by premature death (mortality).

A striking result from the study is that the main economic impact of AIDS between 1981 to 1988 is due to indirect costs rather than direct costs. The former accounted for over 80 percent of total estimated economic costs. The reason for this high indirect costs is attributed to the fact that most of the victims of AIDS are young persons. In 1988, 72 percent of AIDS victims are in 20 to 39 year age bracket, and thereby, in their most potentially productive years. The average age for AIDS victims is 24 years. Finally, the authors forecasted economic costs for the fiscal years 1989 to 1992 using a discount rate of 5 percent.

W.H.P.2 HEALTH-CARE COST OF AIDS AT A HOSPITAL IN CANTON TAIWAN
ANAN, HANJIN-Hsiangse, P. Hsuife, J. H. Odean, R. Antolin, J. J. Aorta, et al.
Hospital Rostrer Belcora del Pao-Lao Palmas-Spain.

Objective. To evaluate health-care burden of AIDS and AIDS-related conditions on our Hospital.

Methods. Review of clinical records of HIV-infected patients admitted to Hospital or attended at the outdoor clinic from Jan-1987 until Nov, 1988.

Results. Number of HIV-infected: 144. Number of AIDS cases: 20.
Duplication time of AIDS cases: 8 months. AIDS cases dead: 17 (35%)
Main risk-factor for AIDS: Male homo-bisexuality (50%), and parenteral drug abuse (20%). Main opportunistic infections: PCP (30%), PJP (30%) and candidal oesophagitis (36%).

Number of AIDS-related admissions: 182. Mean delay from admission to definite diagnosis of suspected infections: 13 days. Mean length of hospitalization: 13 days. Number of invasive procedures per admission: 1.4 (surgery: 0.40, or endoscopy) cost per admission: \$13,000 pesos (720 US\$).

Conclusion. AIDS cases are rapidly increasing in our Hospital area. Our AIDS cases are mainly homo-bisexual males and parenteral drug abuse. Tuberculosis is a leading opportunistic infection in our AIDS patients. It is necessary a plan for reducing pre-diagnostic time, length of hospitalization and health-care cost.

W.H.P.4 COMPARATIVE COSTS OF AIDS CARE IN PUBLIC AND PRIVATE SETTINGS
Kopari, L. J.; Shepard, D.; Rieak, K. J.; Rieak, J. L.***; Smith, S.; Varney, J. A.
**Harvard Institute for International Development, Cambridge, MA, USA,
***University of Puerto Rico Medical School, San Juan, PR.

Objective. To identify the cost advantages of public and private settings for AIDS patient care more cost-effective.

Methods. We assessed retrospectively the cost of AIDS care in 34 consecutive episodes of hospitalization in a private hospital and 245 in a public hospital in San Juan, P.R. in 1987-88. This area has many characteristics of a middle-income developing area. Types, amounts, and unit costs of services were abstracted from medical records and cost reports using identical protocols.

Results. The average length of stay was 16.4 days in the private hospital and 17.5 days in the public hospital. The cost per day averaged \$200 in the private hospital and \$140 in the public hospital. Patterns of care appeared similar. In 1988, however, after private management and incentives had been introduced in the public hospital, the average cost per day was reduced to \$190.

Conclusions. The private hospital appeared to provide care more efficiently through a lower daily rate, earlier discharge, and more efficient use of skilled services. Good management can improve the efficiency of care of patients with AIDS.

W.H.P.6 THE ECONOMIC AND SOCIAL IMPLICATIONS OF AIDS IN AN AFRICAN SETTING
Mwambi, Patrick, Mwenya, N., Kabonjo, L., M'kololo, K. and M'wambi, Jaine

**Department of Pathology, New York Hospital, and *Ministry of Health, Kenya.

Objective. To evaluate the economic and social impact on families of children with AIDS.

Methods. We reviewed the economic status of 84 families of children with symptomatic AIDS admitted to a state subsidized teaching hospital and the social interaction of the community toward the afflicted family.

Results. 39 percent were low education employees, 42 were unemployed and 3 had already died. The average hospitalization was 24 days with 23% mortality. A single hospitalization was 4 times and funeral expenses 11 times the average monthly income. Those who were employed received assistance from their employers for medical expenses and burial, however, when expenses were supported by the family. African tradition requires a dignified and respectful funeral which entails considerable expense. The unemployed depended on family and friends for financial assistance. The most remarkable observation was the community's response to the afflicted and their families. A world process was observed: the community was tolerant and accepting of AIDS patients; extended families, friends and neighbors gave an abundance of moral support and contributed toward the medical care costs and funeral expenses.

Conclusion. The AIDS epidemic has placed a financial burden on the society. In the face of economic crisis, Africans continue to show a strong social solidarity, acceptance and goodwill towards AIDS patients and their families. In the case of Kenya, the community contributes toward the funeral expenses.

HOW COST-ANALYSIS UTILIZES INFORMATION
Murray, Sheila, MD, BSc, J. Johnston, J. Gosselin, BV, G. Davis, BSc(Ed)***, *Harvard Medical School, Boston, U.S., **McGill, St. L. Health Sciences Center, Boston, U.S., ***Health Costs Model Development, Boston, U.S., USA

OBJECTIVE: To provide a means (anatomically) (Viral) case management system utilizing personal computer(PC) in the healthcare setting.
METHOD: Perinatal Research Hospital(PRH) is the largest medical provider for all isolated patients in Dallas County, TX, with an active caseload of 500 patients out of 1500 total. There are three major components to the data collection system: clinical, accounting and AIDS Registry. The AIDS clinic utilizes 4 clinics (A in a local area network to maternal clinic) and research data. The Maternal Services Department maintains data on a single AIDS PC on all HIV related hospitalizations. The Hospital Inpatient Service Department utilizes its admission computer to report HIV related data to the incident of service (investigations, charges and collection).
RESULTS: An clinic database secure and sensitive patient data to enhance treatment, medical insurance and research. It also serves as a real-time report of practice immediate access to data for telephone consults and interviews with community healthcare providers. Retrieving the maintainers' facilities/organizations to track total service utilization by age section.
CONCLUSIONS: Attainment of quality case assessment through an enhanced information system. Total cost reduction through data analysis/forecasting of costs, clinical treatment and collection of epidemiological information. This system is utilized by Administration, Nursing Management, Clinicians, Quality Assurance, Infection Control, Business Services and Public Relations.

W.H.P.9

SOCIO-ECONOMIC MODELS TO ASSESS THE ECONOMIC IMPACT OF HIV INFECTION
Kahn, John
McGill Centre for Medicine, Ethics and Law, Montreal, Quebec, Canada.

Objective: To propose two comprehensive models that could be applied in the assessment on an international scale of the economic impact of HIV infection.
Method: A review and comparative analysis was carried out of existing literature on the economic impact of HIV infection, drawn from four countries (Canada, U.S., Australia and U.K.).
Results: The literature varied considerably with respect to its acknowledgment of the ways in which costs might be affected by:
1) **Geographic Differences:** local, regional and international, e.g. with respect to incidence and prevention, modes of transmission and manifestation of pathology.
2) **The Effects of Change:** e.g. in disease definition, in treatment and diagnosis, in health care system, funding and utilization, and in the availability of human and natural resources.
3) **Other factors:** e.g. absence of an explicit conceptual framework, models and methodologies. This lack of explicitness limited meaningful comparability.
Conclusions: Two comprehensive models are defined:
Model 1: The Order of Costs: This model delineates three 'orders' of costs: First Order (Medical Costs, Care and Containment); Second Order Costs: foregone earnings, household services, labour and expertise, research, construction and property; Third Order Costs: 'psycho-social-cultural'.
Model 2: The Cascade Effect: This model delineates seven 'levels' of cost: individual, immediate support system, community, institutional, government, society, and international. The possible advantages or disadvantages relating to the development and use of a standardized, international approach in determining economic impact of HIV infection will be discussed.

W.H.P.11

FINANCIAL BURDEN OF FINANCING OF HIV TREATMENT
Mullaly, Julia* MD Department of Health and Mental Hygiene, Baltimore, MD U.S.A.

Objective: The financial burden of HIV treatment is shared among Federal, State, and private payers. It has been difficult to assess, however, the distribution of this burden among payers during the course of the AIDS epidemic. This paper applies a novel HIV information system to measure temporary, long-term, and community-based HIV-related treatment across payers. **Methods:** Institution and community-based services used by 1,300 Maryland residents with AIDS diagnosed between 1985-1989 were retrospectively tracked to information system made up of longitudinal, person-based files served as the basis of this study. The system links HIV registry, vital statistics, hospital and community-based services, and insurance claims records to measure the nature, value, and costs of AIDS treatment during the period between diagnosis and death. **Results:** Volume of AIDS treatment, associated costs, and payer mix are examined during the course of illness. Inflation-adjusted costs, charges, bills, and payments made by Federal and State payers are measured. Unreimbursed services generated by the difference between charges, bills, and payments are estimated. The proportional distribution of the financial burden of HIV-related treatment and level of reimbursement provided by public and private payers is reported for the 5-year period studied. **Probability of shifting from private to public financing is estimated, and shifts from State to Federal assistance categorized during the course of illness. Factors associated with shifts in payer, insurance characteristics and risk group, are also discussed. Conclusions:** Findings of this study are useful to policy makers and health insurers in projecting the financial impact of the AIDS epidemic.

W.H.P.8

DIRECT COSTS AND FINANCING OF HIV TREATMENT AND COMMUNITY-BASED TREATMENT
Mullaly, Julia*

MD Department of Health and Mental Hygiene, Baltimore, MD, U.S.A.
Objective: The economic impact of HIV on the U.S.A. health care system has been difficult to measure. This paper applies a novel, automated HIV information system to measure and direct costs of HIV-related treatment across providers and payers. **Methods:** Institution and community-based services used by 1,300 Maryland residents with HIV infection during the period between 1985-1989 were retrospectively studied. An automated information system made up of longitudinal, person-based files served as the basis of this study. The system links HIV registry, vital statistics, hospital, long term and chronic care, and community-based services, and public and private health insurance claims records to measure the nature, value, and costs of service use associated with HIV treatment during the period between diagnosis and death. **Results:** HIV-related costs are estimated for treatment of AIDS and AIDS. Inflation-adjusted average lifetime, annual, and per visit costs, as well as components of costs, are reported. Trends and the difference between costs, charges, and payments are described, as well as shifts in payment source during the course of illness. Factors including socio-demographic characteristics, transmission group, survival time, and case and service-use are also discussed. **Conclusions:** Findings of this study are useful to policy makers at the local, State, and Federal levels in planning services and financing required to meet the needs of persons with HIV disease.

W.H.P.10

HIV INFECTED HOSPITAL PATIENTS IN NEW YORK STATE (NYS): THE CREATION OF LONGITUDINAL INFORMATION FROM A HOSPITAL DISCHARGE DATA SET
Kaufman, GI, Orabau, JC, Norick, L, Yan, Y, Schmidt, E
New York State Department of Health, Albany, NY, USA

Objective: To obtain longitudinal information regarding HIV infected patients in NYS acute care hospitals, useful for describing HIV related acute care needs.
Methods: Identified medical records of patients discharged from NYS acute care hospitals between January 1, 1983 and October 1, 1987, which contained a diagnosis of HIV infection (86,864) were linked into a longitudinal file (HLVLF) of patient specific cases (25,000). The records do not contain explicit personal identifiers, so linkage was accomplished using hospital code, medical record number, sex, date of birth, address, and payer identification codes.
Results: A validation study utilizing 1985 Medicaid discharge information indicated: the HLVLF cases contained 85% (SE±2.2%) of the expected discharge; the number of HIVLF cases was too large by 10% (SE±2.2%) due to a failure to link all the discharges to the appropriate cases.
The number of new HIV patients (HIV infection identified for the first time), entering the acute care system increased monotonically on a quarterly basis from 1984 through 1986. In the first quarter of 1984, 421 new HIV patients utilized the acute care system, as compared to 1899 in the last quarter of 1986. During the first year of acute care, new HIV patients in 1984 or 1985 exhibited an average of 1.6 admissions, and a mean total of 30 inpatient days. During this first year, patients with multiple stays had longer first and last stays as compared to intervening stays. As the number of stays increased the period between stays decreased and the length of stays of each admission decreased. **Conclusions:** The HLVLF is of sufficient quality to be useful for estimating acute care resources required to respond to the HIV epidemic.

W.H.P.12

A PROJECTION FUNCTION APPROACH TO ESTIMATING THE ASSUMED ASSOCIATED IMPACT OF AIDS
Mullaly, Julia*

MD, BSc, PhD, Department of Health and Mental Hygiene, Baltimore, MD, U.S.A.
Dell, David, PhD, Center for Health Services Research, University of California, Los Angeles**Harvard University, California.

OBJECTIVE: To combine demographic projections of the HIV epidemic's impact on population size and structure with economic projections of impact on gross domestic product (GDP) in order to estimate the epidemic's impact on per capita GDP.
Methods: Based on previous modeling of the population dynamics of the disease by one of the author's and on appropriate projection functions for sub-Saharan Africa which incorporates measures of human capital, the paper estimates the future course of both the GDP and the population under a variety of alternative assumptions. Sensitivity analysis is performed with respect to the size of the epidemic and with respect to the amount of human capital assumed to be affected individuals.
Results: Results are presented for the epidemic's impact on GDP growth rates and GDP per capita and compared with those of a naive model using a constant growth rate per HIV-infected person. The discounted present value of losses due to the infection of a single individual with HIV are estimated under several disease rates.
Conclusions: The AIDS epidemic is affecting most negatively certain sub-Saharan African countries that are already experiencing slow or negative rates of per capita GDP growth. This paper estimates the degree to which the AIDS epidemic can exacerbate the growth problems of the most severely affected economies.

Résumés économiques du SIDA The Economic Impact of AIDS

W.H.P.13

A REGIONAL-AREA MODEL FOR THE ANALYSIS OF THE ECONOMIC IMPACT OF AIDS IN SUB-SAHARA AFRICA

Author: P. Gervais, L.M. Dyer, M.***
*Northwestern University, Boston, Massachusetts; **Harvard University,
North and South, Washington, D.C.

Objective: This study presents an internally consistent view of the sectoral-macroeconomic repercussions of the epidemic on the labor market, on the production sectors and hence on the entire economy of a "typical" sub-Saharan African country.
Method: The study characterizes the AIDS endemic as a shock to the supply of labor of several (12) categories in several different productive sectors of a "typical" sub-Saharan African country. The study uses a complete regional multiplier model order to represent this shock, and the effects will be reported to the various sectors and the flexibility of this system along in adjusting to such shocks, and it will be possible to predict the internally consistent effects.
Results: The study estimates the effect on sectoral-macroeconomic performance of 12 different situations regarding the distribution of the epidemic across skill categories of labor. The paper identifies the critical role of AIDS epidemic in each general equilibrium method. This study uses in this paper five substantially different estimates of the macroeconomic impact, then would the sectoral-multiplier equilibrium method. Results are presented for the epidemic's impact on such macroeconomic aggregates as current account balances as well as for total GDP.
Conclusion: Because the study shows that aggregate macroeconomic impact of the epidemic can be considered to be severely affected African country, expenditures on domestically effective preventive measures are justified. Furthermore, the study shows to what degree such policies of source prevention strategies of AIDS may have a more beneficial effect on macroeconomic performance than others.

W.H.P.15

DECLINE OF AIDS INCIDENCE IN KENYA

L.N. MUTHARI* DR. N.K. AGATA, **DR. G.S. GACHIEI, **DR. G.O. MBOGUA
*KENYA MEDICAL RESEARCH INSTITUTE NAIROBI, KENYA
**KENYATA NATIONAL HOSPITAL NAIROBI, KENYA.

Objective: To reduce and control the spread of HIV infection in Kenya.
AIDS: By August 1988, 2378 cases of AIDS had been reported cumulatively by all the Health Facilities in Kenya. Data from three provinces that have been reporting consistently over a period of 18 months were compared with national figures - Graphical plots, linear trends and predictive models were fitted to the data.
Results: The rate of change for the national figures over the 18-month period show an increasing trend. But comparing 1987 and 1988 there is a definite drop in the number of the new cases reported. At the province, a significant improvement observed in 1987, but the curves had asymptotic tendencies in 1988.

If the 1987-8 rate of change was sustained over 1988-9 the predictive models show a slight increase in the number of cases in Nairobi (425 in 1988 to 509.22 in 1989); a drop in Kwana (208 in 1988 to 142 + 24 in 1989); and a drop also at Coast (208 in 1988 to 85.2 + 24 in 1989).

Conclusion: The National figures are likely to stabilize or drop after the provision of testing kits, for HIV in all the district Health facilities (currently 30/41) and the current campaign against AIDS.

W.H.P.17

A MODEL FOR EVALUATION OF UNKNOWN FRESH HIV-INFECTED PERSONS
M. HALLIN, Anders Brattler, M.
National Bacteriological Laboratory, Stockholm, Sweden

Objective: Evaluation of the extent of unknown HIV-infected persons in Sweden and a method used for this purpose.

Methods: Use of information collected by two report systems in Sweden concerning HIV: 1) Reports of HIV-infected persons (coded) initiated in 1985; 2) Reports of cases fulfilling criteria for AIDS since 1983.

Results: Of 228 AIDS cases diagnosed in 1985 to 1988 (22, 51, 68 and 87 cases in respective year), 59, 37, 25 and 311 were diagnosed during the four respective years in connection with the first HIV test, i.e., within 3 months of the test. However, there were considerable variations in different groups. In 1988, all hemophiliacs and IV drug users and the majority of the blood transfusion recipients had been known as seropositive for more than a year before the AIDS diagnosis while those infected heterosexually or homosexually 12 respectively 20% were diagnosed as seropositive in connection with the AIDS diagnosis. Several of these persons were people coming directly from abroad.

Conclusion: The findings indicate that among hemophiliacs, blood transfusion recipients and IV drug users few of those infected in the early 80ies are not yet detected. However, heterosexually or heterosexually infected in the early 80ies, a number of individuals have not yet been tested for HIV antibody status. A further extension of this kind may contribute to the estimation of unknown HIV-infected persons.

Modélisation mathématique et prévisions Mathematical Modelling and Predictions

W.H.P.14

THE SOCIOCULTURAL AND ECONOMIC IMPACT OF AIDS ON SOCIETY

BOOK, Frans M. van den Dijk, Jager, JCM*, Reining, BP*
*Netherlands Institute of Public Health, **National Institute of Public Health and Environmental Protection, The Netherlands.

Objective: Investigation and analysis of the present and (possible and predicted) future situation(s) of the three mutually dependent AIDS-epidemics: the infection with HIV, the AIDS epidemic and the epidemic of reactions and answers -social, cultural, economic and political- to the AIDS and HIV epidemics.

Methods: A scenario-project can be separated into three components: -definition of the existing situation (basis analysis) by means of description and interpretation of the three AIDS epidemics as they exist at present -the development of a number of future perspectives, as an alternative of the present situation

-scientific research into a series of events that could lead to the future perspective with an indication of connecting pathways

Scientific research makes use of data already collected
Results: A differentiation is made into three aspects: epidemiological aspects; economic aspects; sociocultural aspects. A model for the description of the course and the scope of the HIV epidemic is conceived. This model, has the epidemiological aspects as reference point. The epidemiological aspects will serve as basis and background for the determination and assessment of the influence of the AIDS and HIV epidemic on society.

W.H.P.16

THE USE OF RANDOM GRAPHS IN MODELLING THE TRANSMISSION DYNAMICS OF HIV-INFECTION

Philippe Beaudouin P. Bob, T. Kijger
Rahabji Ri Yvicki, Stockholm, S-14030 Stockholm 1, FRO

Objective: To develop a mathematical model for the spreading of sexually transmitted diseases being able to account for the characteristic features of HIV-infection. This model mathematically resembles standard models studied so far to compare simulations based on this approach to data with seroprevalence results in the case of AIDS.

Methods: Based on two concepts: a random graph, representing the mesh of sexual contacts inside a society, and a discrete time stochastic process, describing the spread of infection on the graph, the model incorporates specific assumptions through specifications on the structure of graphs and on the dynamical process. Probabilistic and combinatorial methods lead to algebraic tractable model structures, while direct computer simulations deal with realistic scenarios.

Results: Even, the general basis of the modelling approach is described, it is shown how a variety of important details can be incorporated, and how it relates to standard epidemiological models; it is discussed how it may be used in public health planning to predict the effects of certain prevention strategies, a problem which can only be solved by a model capable of handling internal balances.

Conclusion: This new approach to the epidemiology of sexually transmitted diseases leads to predictions different from standard epidemiological models; it is versatile enough to account for the particularities of HIV and it allows for a detailed description of the dynamics of the transmission process; it will be extensively adapted, in its specific application, to reflect the actual state of knowledge about the epidemiology of AIDS.

W.H.P.18

HIV Carriers: Non-Infectious Initial Interval Shows up Spread of Virus
GONZALES, Jose J.,* Davidson, P.,** Mos, C.E.,***
and Koch, M.C.,****

*A&A, N-4185, Arundel, N.M.V., Bergen, N-5000 Bergen, **AAH, N-4601 Kristiansund, Norway, ***VAC, S-546 00 Karlsborg, Sweden.

Where the HIV is sexually transmitted, an increasing number of cases have been observed with a seroconversion latency period lasting 1 to 3 years and longer. In young HIV carriers, these appear to be initially non-infectious or very slightly infectious. Transmission of the HIV through transfusions of seronegative blood have shown, however, that seronegative HIV carriers become viraemic before seroconversion. Recent evidence suggests that the degree of infectiousness increases with the duration and progress of the infection.

Mathematical models show that a non-infectious initial interval causes a surprisingly long delay in the spread of the HIV, and thus a slowing down of the epidemic. During a temporary phase which can last for many years, depending on the length of this interval, the incidence of HIV carriers remains low; it appears as if the disease is spreading in a less infectious form. Our models take into account heterogeneous sexual behavior, import and export of persons and infections, and variable patterns of infectiousness. Sensitivity analyses show that the non-infectious initial interval has a considerable influence on the dynamics of the spread of the HIV.

Répercussions économiques du SIDA The Economic Impact of AIDS

Affectation des ressources Resource Allocation

Th.H.1.P.1 AFFECTATION DES RESSOURCES MONÉTAIRES (C-3AM)
Lise Lefebvre, Directrice générale, Comité SIDA Aïe Montréal,
Montréal, QC, Canada.

Objectif: Faire part aux congressistes de la distribution des ressources financières attribuées par les différents paliers gouvernementaux aux organismes sans but lucratif au Québec en matière de SIDA.

Méthode:

- Exposition/conférence
a) distribution gouvernement fédéral
b) gouvernement provincial
c) autres ressources
d) répartition interne

Résumé: Les services offerts selon les arguments obtenus tout en étant respectueux de la mission et des objectifs de l'organisme.

Conclusion: Évaluation du rendement selon les ressources financières pour 1983-1989.

Th.H.1.P.2 THE ECONOMIC IMPACT OF AIDS: A PATIENT PERSPECTIVE
Jackson, Leslie and Parfitt, M.A.
Victoria General Hospital, Victoria, Canada

Objective: To examine the economic impact of AIDS on the patient population. **Methods:** Semi-structured interviews were carried out with 25 AIDS patients in three different centers in Ontario - Toronto, London and Ottawa.

Results: Approximately one-half of the patients interviewed have been negatively impacted upon economically because of their health status. These patients tend to be in their twenties or early thirties and have not had well established careers or jobs. In most cases, those who have experienced a negative economic impact have been fired from their fulltime jobs because of their health status, or have been forced to quit because of poor health. In order to survive economically, they rely on social assistance (welfare, U.S.C. or family benefits), financial assistance from their family and/or spouse. Some have worked when their health permits and when such work is available. Few have worked since they have experienced a drastic reduction in income tend to be in their late thirties or older who have, or have had, well established careers or jobs. For these AIDS patients, withdrawing from the work force either temporarily or permanently has meant relying on social leave or disability plans (the latter typically purchased through employers), and their income has only been reduced slightly, if at all.

Conclusions: The economic impact of AIDS varies across the patient population. Not all AIDS patients experience a negative economic impact because of their health status, but those who have tend to be younger patients who have not had well established careers or jobs.

Th.H.1.P.3 DISTRIBUTION AND CHARACTERISTICS OF AIDS HOSPITALIZATIONS IN THE U.S., 1980-87

Wald, K., Ball, Ph.D.,* and Barbara J. Turner, M.D.,**
* National Center for Health Statistics Research, CDC/MS, Rockville, MD, USA;
** Thomas Jefferson Medical College, Philadelphia, PA, USA

Objective: To investigate the characteristics of AIDS hospitalizations in 1980-87 in a large, nationally representative sample of U.S. hospitals.

Methods: The Hospital Cost and Utilization Project collects over 2 million discharge abstracts per year from a sample of 4000 short-term community hospitals across the U.S. AIDS discharges have been selected based on the presence of an AIDS diagnosis or PCP. Both patient and hospital characteristics are analyzed to provide a national view of AIDS.

Results: In 1980, adult AIDS discharges (26320 from 156 hospitals) were concentrated in the west (39%) and the northeast (36%), in urban areas (88%), and in larger than average (over 400 beds), private not-for-profit (68%), and teaching (88%) facilities. On average, length of stay and total charges were highest in the northeast (17 days, \$1204), but charge per day, a measure of service intensity, was highest in the west (1992). AIDS discharges were most often covered by private insurance (54% versus 43% for all discharges) but were twice as likely to be covered by Medicaid (23% versus 11%). 63% of AIDS discharges reported Medicare coverage.

Conclusions: For policymaking at a national level, the view of AIDS must be expanded beyond New York and California. Substantial variations in patient characteristics and resource use are found when a large number of AIDS discharges from across the U.S. are considered.

Th.H.1.P.4 THE ECONOMIC IMPACT OF AIDS ON THE HEALTH CARE SYSTEM IN SWITZERLAND

Murphy, M., Pedergnani, lic.oec., University of St. Gall.

Objective: To estimate the impact of all direct costs due to HIV infection and AIDS on the Swiss health care system according to the data collected by applying current epidemiologic projections (com. 12,000 in 1991).

Methods: Analysis of medical and financial records of AIDS patients (79 of all Swiss cases), of governmental subsidies and of other direct costs.

Results: Personal costs were far lower than overall governmental costs. This will change radically until 1995. Estimated lifetime costs were 74,000 Sfrs. per AIDS patient (including outpatient treatment). Health care insurances will have generated such excesses among policyholders, paid typically only 50 percent of all medical costs, the remaining costs consisted almost entirely of increased hospital deficits that were covered by taxes.

Direct Costs (in million Sfrs.)

	1986	1987	1988	1989
Personal Costs	6.0	8.0	12.0	80.0
Governmental Costs	18.0	26.0	48.0	50.0
Total Direct Costs	24.0	46.6	60.0	275.0

Among nonpatients costs, there had been expenditures for prevention & information (186512) and care (198210), screening (70,070), HIV testing (4,0 12.5), research (2,0 10.0) and other expenditures (1,5; 8.1). By comparison, the impact of alcoholism (3.14) and rheumatism (5.38) on the health care system today is still far higher than the estimated impact of AIDS (1.01) in 1995. The number of hospital beds required is low and will remain low (1000 beds in 1995 or 1.0% of all acute care hospital beds).

Conclusion: With cumulative 3,500 (12,000) AIDS cases expected until 1991 (1995), AIDS will have only minor resource implications on the health care system and will create the health care insurers only negligibly.

Th.H.1.P.5 HOSPITAL UTILIZATION AND HOSPITAL EXPENDITURES FOR PATIENTS WITH HIV DIAGNOSES, UNITED STATES, 1984-1987

Mary Weing and Olivia Gene Kozak, National Center for Health Statistics, Hyattsville, Maryland, USA

Objective: To present a national overview of hospital utilization and expenditures and the changes found over the period 1984-1987.

Methods: The data are from the National Hospital Discharge Survey (NHDS) and are collected from the medical records of a sample of patients in a national sample of over 400 short-stay general and specialty hospitals. For the 4-year period, 1984-1987, there were over 700 records with an HIV diagnosis. Estimates of annual hospital expenditures were computed using data on hospital expense per day from the American Hospital Association.

Results: Approximately 24 million dollars were expended by short-stay hospitals in the care of HIV patients in the years 1986-87. HIV patients spent almost 1.4 million days in hospitals in 1986-87, compared to half a million days in 1984-85. The increased number of days was due to growth in the number of hospitalizations: 10,000 in 1984, 23,000 in 1985, 37,000 in 1986 and 49,000 in 1987. The average length of stay for HIV patients remained at about 2-2½ times the average for all patients (15.9 days vs. 6.4 days for all patients in 1987). In 1986-87, public sources, primarily Medicaid, were expected to provide payment for 40 percent of hospital days for HIV patients, compared to 25 percent in 1984-85.

Conclusion: Hospital use and costs for HIV patients with HIV diagnoses are growing rapidly in the United States. Public funds are supporting an increasing proportion of hospital costs.

Th.H.1.P.6 Impact of Hospitalized, I.V. disease in a low incidence area

G.H. Taylor, L.V. Medianski
University of Alberta, Edmonton, CANADA

Object: With 6% of the Canadian total of HIV diagnosed AIDS cases Alberta is a low incidence area. To determine the impact on and distribution of I.V. disease within the 6 active treatment hospitals within the city of Edmonton, a medical records search was undertaken.

Method: Medical records analysis using ICD diagnosis indexes and ICD-9-CM codes 795.8, 279.19, 279.3 and 042.0 - 042.9 extracted hospital admissions and days of stay for all Edmonton hospitals 1980 through 1988. Data for 1988 was extrapolated to year end from available information.

Results:

	1985	1986	1987	1988*	Total	Full Edmonton days	Bed days
1 (UW)	31	334	767	1512	2640	80X	29
2	40	32	182	120	466	12X	29
3	0	0	7	27	34	1X	12
4	0	60	6	4	70	2X	14
5	0	37	14	0	51	1.25X	14
6	0	0	0	70	70	2X	29
Total	71	463	1006	1663	3303	99.25X	100X

Whereas provincially between 1985-88 there was a 180% growth in annual AIDS incidence, in Edmonton gross incidence grew 138%; 75% of bed use by identified HIV patients was for AIDS.

Conclusion: Even in a low incidence area such as ours, impact of HIV disease has grown considerably. Growth in diagnosed AIDS cases has greatly underrepresented growth in in-patient days. Reasons for and consequences of the maldistribution of impact needs to be explored.

Session d'affichage Poster Session

Répercussions économiques du SIDA The Economic Impact of AIDS

Th.H.P.7 A SYSTEMIC APPROACH TO AIDS (ECONOMIC AND SOCIAL) IMPACT ANALYSIS

Dr. BOUNYA-EPEE, Samuel Ph.D. The University of Yaounde, Cameroon

Our aim in this study was to construct indicators leading to a coherent planning (indirect) system by which to reveal obstacles to world distribution of AIDS funds can be worked by reading off these relative marginal efficiency rates in allocating mean to ends at all levels of hierarchical and functional autonomy (individual-nation-society-world), then the direct method of experimenting with and intended behavior or logical action constraints can be used as best method at solving the crucial problem of modern man or modern society ought for survival from a less and less complex or cooperative environment.

Th.H.P.9 LABOR PRODUCTIVITY LOSSES TO NEVADA'S AND THE AMERICAN ECONOMY RESULTING FROM PNEUMONIA DEATHS DUE TO AIDS

Chandra A. Vaidya, M.D., University of Nevada, Las Vegas, Las Vegas, Nevada, U.S.A.

Objective. To determine the labor productivity losses to Nevada's and the American economy resulting from pneumo and death of persons with AIDS reported in Nevada during the years 1987 and 1988. **Methods.** The past and future income losses were individually calculated for each individual in the population (N=709) based upon date of birth, sex, race, age at AIDS diagnosis, month and year of AIDS diagnosis, occupation and annual income. Past income loss was defined as the period between the date of diagnosis and December 31, 1988 and was determined by calculating the partial salary for the year of diagnosis if diagnosed in 1986. For those diagnosed in 1987 the partial salary for 1987 was added to the projected 1988 salary. Upon determination of each individual's work life expectancy future income losses were calculated by multiplying the 1988 annual income by a growth factor of 1.4% for each year of the remaining work life. **Results.** The labor productivity loss to Nevada's and the American economy in past and future income adjusted for inflation for all (N=709) AIDS cases reported in Nevada during 1987 and 1988 was \$301,929,724. Past income loss was \$4,654,398 and future income loss was \$301,275,326. In constant 1988 dollars the total lost income is \$117,567,218. **Conclusion.** AIDS is having a serious impact upon the productivity of the labor force in Nevada and the United States. Billions of dollars will be lost to the American economy over the next few years as a result of the premature disability and death of persons with AIDS.

Th.H.P.11 Medical Consumption of HIV positive outpatients in London: an analysis in terms of gravity level

Y. THOMAS, J. LA. BUCKLER & C. COTTEAU P.

Laboratoire d'Economie sociale 90 Rue de Tolbiac 75013 Paris cedex 13 France
The aim of the study was to estimate the structure of the medical consumption of patients with HIV infection according to their seriousness level, irrespective or AIDS status or the prognosis.
This study was conducted in Paris and Lyon. During 1985-110 patients (50% men) were recruited and filled up a questionnaire that was given in ambulatory consultations or at the general practitioners. After acceptance by the patient, the specialist or general practitioner noted the seriousness level on the back of the questionnaire according to a check list (four cases). The questionnaire included: the number of ambulatory consultations (general practitioner and specialist), the cost of drugs and biological examinations, the number of stays at hospital and some items about the professional life.

The main results are: there is a significant difference between the structure of the consumption of the retrospective AIDS patients. This effect is an accumulation effect, non substitution one (e.g. from 1.3 to 4.5 G.P. consultations for 3 months, and from 230 to 670 FF for the drugs). In the beginning of the disease, the G.P. are autonomous or their prescriptions while they are primarily with hospital specialists when their patients fall in AIDS disease.

There is no effect of the participation to a therapeutic trial in terms of consumption outside of hospital because expensive drugs are given only by hospital.
Most of the patients included in the sample are working (80% of retrospective and 25% of AIDS patients). There is a low economic loss consumption (2.7).
The direct cost of care outside hospital (according to the Social Security prices) is: 1.790 FF (average) \$ 100 for a retrospective patient (1 G.P. and 2 stays at hospital); for AIDS patients, the direct cost is 8.734 (\$ 1400, 516 FF paid, by the patient)

Th.H.P.8

THE CANADIAN AIDS RESEARCH CONTRIBUTION: A CRITIQUE
Ronald Allan R. Department of Internal Medicine, University of Medicine, Winnipeg, Manitoba, Canada

Canadians are becoming involved in the international effort to control the spread of HIV, and to understand the biology of the agent and the host response to it. This is evident by a number of parameters including the number of abstracts at the International Symposia from 1983(1) through 1989 (over 40), and the major contributions to the world literature. In 1989-90, almost 2% of the total Canadian research effort or 10-15 million dollars will be allocated to AIDS research. What is this purchasing? What are the priorities for the future?

All AIDS researchers in Canada have been circulated with a questionnaire to identify Canadian contributions and determine future directions. The questionnaires are being collated. It is intended that this exercise will determine how AIDS researchers in Canada evaluate the contributions made to the direction and quality of leadership of the Canadian AIDS research effort, and priorities required for the future. This is a constructive critique with some guidelines intended to determine where we wish to be and how we plan to get there.

Th.H.P.10 STUDY ON CONSUMPTION OF CARE OF HIV-POSITIVE PATIENTS

Bo R Nilsson*, Knut Liljén**, Harry Malmgren*** et al.

* Department of Cancer Epidemiology, Karolinska Hospital, Stockholm, Sweden
** National Bacteriological Laboratory, *** National Swedish Board of Health and Welfare, Stockholm, SWEDEN

Objective. A follow-up study to estimate the consumption of institutional and non-institutional care of patients with HIV/AIDS and to study the changes in consumption over time.

Method. Two random samples of HIV/AIDS patients reported to the REGION wide register of National Bact. Lab. before 1986-07-01 (1st sample) and after 1986-07-01 (2nd sample) were drawn.

Conclusion. The consumption of institutional and non-institutional care for HIV/AIDS patients can be estimated. When forecasting the need of care, the results from the studies can be served as a basis of facts.

Results. The follow-up study (the 2nd sample) is going to be reported preliminary in June, 1989 and compared with the first one. Parts of results from that study show that the estimated yearly number of days of institutional care for AIDS patients was 178 per patient. For patients without developed AIDS, the corresponding number was 5.9 per patient. The estimated, yearly number of non-institutional care for AIDS patients was 17.1 per patient; 6.0 for HIV patients.

Th.H.P.12 COMPARATIVE AND COST-EFFECTIVE APPROACH TO THE MANAGEMENT OF AIDS PATIENTS IN AN OUTPATIENT CARE FACILITY: THE RESULTS OF A PATIENT SURVEY.

SMITH, Bill, Seaworth, Jeannette. San Juan AIDS Institute, May, PR

A general survey was conducted in May, 1988, to determine the status in the world with the present number of AIDS cases reported by population density and the status of the management of the population. The survey began on May 2, 1988; the cumulative number of AIDS cases in San Juan will be between 50,000 and 60,000. The survey included the management of 1,911 patients. Also, it was estimated that 55% of the cases reported to Puerto Rico belong to the first 500 cases. The San Juan Department of Health developed a policy statement entitled "AIDS care in San Juan" which explicitly encouraged the cooperation of public and private sectors in the provision of health care. Following this policy, a cost-effective approach to the management of AIDS patients in private corporations formed in December 1988. Resources from the municipality under a contract to provide services, and its main purpose is to offer alternatives to locating and substituting care in ambulatory care or preventive measures and reduce the costs of inpatient care.

As part of its main functions, the Institute provides ambulatory care at its main facilities, located in a three floor of a municipal local health center, which provides care to ambulatory and inpatient patients, other than AIDS patients. Last year, 1,719 patients were evaluated and treated as ambulatory care. 40 patients were picked up in the street, and 400 were picked up in the street. Ambulatory services included: medical assistance and patient's education of services being offered. Final results include a 81% (14,562) of satisfaction regarding the quality of service and a 75% (14,562) of satisfaction regarding the quality of service. The San Juan AIDS Institute (SAII) realized personnel as qualified or slightly qualified in the AIDS field. The SAII has been visited the Institute and more than half of retrospective drug addicts in groups were picked up in the street. The SAII has been visited by the staff of this study are indicative, that in spite of social stigma of high risk groups, the San Juan AIDS Institute has succeeded in providing cost effective, high level care to AIDS patients in San Juan.

Répercussions économiques du SIDA The Economic Impact of AIDS

Th.H.P.19 PEAK PREVALENCE OF HIV IN NAMBIAN TEENAGERS

Legassie, G. J.; Joghret, J.J. J.; Schutte, C.N.J. J.; Taylor, H.B. & Schneider, C. J.

1. Department of Microbiology, Medunsa, Pretoria, South Africa
2. Department of Microbiology, University of Stellenbosch, South Africa
3. RIDIT, MEC, Durban, South Africa
4. Department of Medical Virology, University of Pretoria, South Africa

Objective. To determine the prevalence of HIV-1 and HIV-2 antibodies in a series of 700 serum specimens collected in the east Caprivai area of Namibia. **Methods.** Elisa (Elavia and Du Pont) and Western blot techniques were used to investigate and confirm respectively the prevalence of antibodies to HIV-1 and HIV-2.

Results. Half of the HIV-1 positive specimens were from teenagers and younger. A significant difference in HIV-1 positivity between the two Elisa tests was found (4.25 by Elavia, 5.65 by Pastour). On confirmation by Western blot, a false positivity rate of approximately 50% for both Elisa tests was demonstrated. No HIV-2 positives were confirmed although 15 of 704 (2.1%) HIV-2 Elavia positives were detected. Four false negative results were obtained (4/704) (0.6%). **Conclusion.** In contrast to other countries, Namibian teenagers form the target group of HIV-1 positive individuals. The high degree of false positivity suggests the presence of cross reacting antigens in this area. The detection of false negatives indicates the need for more careful evaluation of test results.

Th.H.P.21 HIV-1 INFECTION IN SEXUALLY ACTIVE AND HIV-1 INFECTED SUBJECTS IN THE PHILIPPINES

Delia Ramos, E.M. Palencia, S.V. Mwanani, C. Lam, J.M., Cepellin Department of Health Research Institute for Tropical Medicine, Philippines

Objective. To determine the prevalence of HIV-1 infection among subjects at risk for or with HIV infection.

Methods. Sera were collected from subjects in Metro Manila being surveyed for HIV-1 antibodies and HIV infected subjects under follow-up. Testing for HIV-1 was performed with particle agglutination (PA) and Western Blot (WB) methods. HIV-1 antibodies were detected with PA and immunofluorescence tests.

Results. A total of 196 samples were tested for antibodies to HIV-1 and HIV-2. The age range was 18-57 years; sex were female; originally from different islands; and with many sex partners from other countries. 60/196 samples showed no antibodies to both HIV-1 and HIV-2 on screening tests. 11 HIV negative samples had HIV-1 antibodies on the screening test. 18 tests were negative in 5 sera retested in 5. Repeat WB studies in another laboratory showed no antibodies in the latter samples. Among the 23 HIV-1 seroreactive samples, no antibodies to HIV-2 were seen on PA screening. There were no positive WB tests.

Conclusion. HIV-1 antibodies do not appear to be prevalent among the subjects studied. Further studies are needed to determine the significance of indeterminate WB results. However, additional serological surveys are necessary to establish the prevalence of HIV-1 among other population groups.

Th.H.P.23 HIV-1 INFECTION IN HETEROSEXUAL POPULATION: PARADOX OR CONCLUSION OF INFORMATION?

Cahn, Doreen P. H.; Drinberg, M.; Boumas, M. P.

Machini, O. P. Hospital Fernández, #1189A, Academia Nacional de Medicina, Buenos Aires, Argentina.

Objective. To perform a comparative analysis of the prevalence of HIV-reactive subjects on 2 populations (one with HIV-reactive individuals reported contact (PI) and the other with multiple sexual partners (P2) unknown HIV serology. **Methods.** A total of 269 patients (P1) without a history of homosexuality, IVDA, transfusion or transfusion was studied (P1-18 men/90, 56 women/0/14; P2: 106 M, 49 W-151 Pt.). Sera were assayed through ELISA HIV-1 Abbott and confirmed through immunofluorescence and/or Western Blot.

Results. Table 1 shows seroprevalence data.

	N = n		W = n		P1 W's partners were as follows:	
	No HIV-1	% HIV-1	No HIV-1	% HIV-1	No HIV-1	% HIV-1
P1	18	-	96	12	5	1
P2	151	11	49	7	14	6
TOTAL	124	11	9	145	13	5
					16	16
					31	5
					14	16

Conclusion. Heterosexual transmission is also confirmed in this population, where it shows a slight preponderance of M over W. When comparison of HIV-1+ risk group, no significant differences were found among their female partners. It is not clear whether P1 has seroprevalence levels higher than those of P2, a paradox that could be due to possible concealment of past epidemiological risk. This fact must be explained through subsequent studies.

Th.H.P.20 AIDS AND MIGRATION IN JALISCO, MEXICO: THEIR RELATION WITH RISK FACTORS.

Diaz-Santana, David & Colla, M. A.

- Consejo Estatal para la prevención del SIDA en Jalisco.
- Instituto Estatal de Salud Pública, U.de G., Guadalajara, Jalisco, México.

OBJECTIVE: To describe migration background in the 250 AIDS patients reported in Jalisco, Mexico, up to December 31, 1988, and its relation to risk factors.

METHODS: Information supplied by the reports of AIDS cases in Jalisco. Analyses focused on travel to foreign countries and high risk practices.

RESULTS: Of the 250 case reported, approximately 50% traveled to foreign countries. Analyzing by sex and sexual habits the percentage modifies significantly.

CONCLUSION: A strong association was found with males and travel to foreign countries, this is stronger in homosexual, at the beginning of the epidemic this relation was more frequent.

Th.H.P.22 NIVEAU DE CONTAMINATION DES ENFANTS A PROTEINE URINE CHIMIQUE

AGUIAR-SANTANA, J. M., MONTE, L., RODRIGUEZ, P., BARRERA, J.

- * Servicio de pediatria y unidades infectadas Hospital A. SIDA, Puerto RICO, CHIMO
- ** Davis & Associates, Inc. Puerto RICO, CHIMO
- *** Hospital Serrano, P.R. CHIMO

OBJECTIF: Déterminer le mode de contamination des enfants hospitalisés pour SIDA dans le service de pédiatrie de Puerto Rico après un épisode de contamination de leur mère.

METHODS: Tous les enfants atteints de SIDA hospitalisés au CHIMO au 30/06/1988 ont fait l'objet d'une enquête, d'un examen clinique et d'une sérologie VIH, de la mère et de l'enfant. L'immunogramme a défini :

- 1) les caractéristiques de la naissance, à domicile et en maternité, les conditions néonatales, le nombre d'hospitalisations et de transfusions aux 18 premiers mois de vie, l'absence d'infection bactérienne, virale ou fongique, les antécédents de transfusion sanguine, de consommation de produits de sang, de médication, le mode d'allaitement et l'existence d'un contact avec des sujets de VIH dans la famille.

RESULTS: Les modes de contamination ont été analysés chez 15 enfants. 4/15 ont contracté le VIH après 19/8/88 par une contamination ; 1/15 ont contracté le VIH après, soit 11/88, non transfusé, dont la mère est séropositive, un examen des facteurs de risque des épisodes d'infection ont permis d'un meilleur contrôle d'hygiène, préventive, vaccinale, curative, etc.

CONCLUSION: L'importance de la contamination par infection cutanée a conduit à une révision des attitudes pré-conception vis-à-vis du plasma et des sérum, à une formation du personnel de santé et à l'organisation d'un programme d'éducation sanitaire.

Th.H.P.24 TYPOLOGY, BEHAVIOR, BISEXUALITY AND HIV INFECTION OF HOMOSEXUAL MEN OF COSTA RICA, 1985-1988

RASA, LAMONGGOL, KANTHA, G. J. Madala, J.; Mata, S. A. *IRISA, University of Costa Rica, San Pedro, Costa Rica.

Objective. A cohort was established to study risk factors and incidence of HIV-infection.

Methods. Healthy homosexual volunteers participated. Confidentiality, informed consent, and freedom to withdraw from the study at any time was assured. Each man was interviewed and tested by an ELISA and confirmed with Western blot. Three of five "types" of homosexual men in the country were represented: openly "gay" and "cryptic" (not publicly gay) (80-87); "male prostitutes" (80-93); and "homosexuals in prison" (80-81).

Results. 1) HIV infection remains confined to the gay and cryptic men (11% HIV-positive). Very few infections have been recorded in male prostitutes or in men in prison. 2) Bisexuality: 13 per cent of gays and cryptic men, and 30 per cent of male prostitutes said they were bisexual. 3) HIV infection by sexual preference: 12 per cent of initially homosexual and 9 per cent of bisexuals were infected. 4) Behavior was similar in all "types", but differences in intensity and occurrence of sexual practice varied.

Conclusion. Our epidemic follows 1985 (Costa Rica); 120 women had heterosexually acquired AIDS appeared in 1988 (4% total). The presence of HIV in many bisexual men forecasts an increase of AIDS in women in the near future.

W.B.O.45A PEPTIDE T PHASE I STUDY: NEUROPSYCHIATRIC RESULTS
Goodwin, F.K.*; Bridges, P.L.*; Hoeseltine, P.N.R.*; Baton, E.*; and Parker, E.L.*
*National Institute of Mental Health, Bethesda, MD.,
*University of Southern California, Los Angeles, CA., U.S.A.

Objective: To evaluate the toxicity and possible response measures to Peptide T (D-ala¹-peptide-T-²⁸-amide), a homologue of VIP and gp-120, and gp-120 receptor blocker.
Methods: In this ongoing study, 4 AIDS and 5 ARC patients received escalating fixed IV doses of Peptide T (1.08-18mg/kg/day) or intranasal (25 mg/day) without other antivirals. Baseline/repeat neurotoxicity measures were taken.
Results: Pruritis in 1 patient led to early drug withdrawal. No neurotoxicity was observed. Individual responses to neuropsychologic testing varied from -0.3 to +1.5 S.D. increments across the 12 week testing period with variable decrements after drug withdrawal. Immuno/virologic drug responses were seen in as many as 8/9 patients. Cognitive neuromotor benefit and reduction of HIV constitutional symptoms on drug were greatest in those patients with immuno/virologic improvement.
Conclusion: Peptide T was well tolerated for 12 weeks, with increases in body weight and well-being noted. Preliminary results indicate that these measures and immuno/virologic tests may be useful efficacy parameters for Phase II testing of Peptide T.

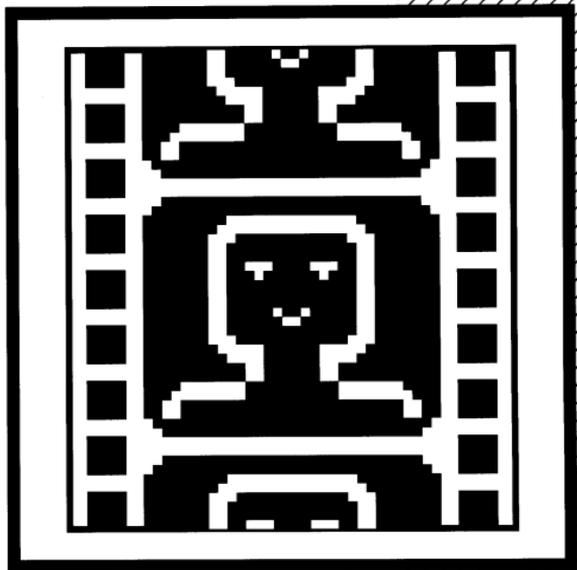

W.F.O.24 ETHICAL AND POLICY ISSUES POSED BY THE USE OF COERCION TO COMBAT THE SPREAD OF HIV INFECTION
Beyer, Ronald; Columbia University, School of Public Health, New York, NY, USA.

From the beginning of the AIDS epidemic there have been calls for the use of the State's power to quarantine to halt the spread of the lethal infection. But because it was quickly established that HIV infection was not casually transmitted the wholesaler's stance on isolation was deemed unnecessary from a public health point of view, contrary to the principles of ethics that require respect for freedom, and undesirable from a public policy perspective. Troubling, however, was the question of how to respond to infected individuals who continued to act in ways that posed a threat to unsuspecting sexual or needle sharing partners. This has been the dilemma of those committed to a 'voluntaristic' approach to controlling AIDS. There is, however, one national model of AIDS control that rejects the premises of voluntarism and that has determined that all HIV infected individuals must be isolated to prevent the possibility of behavioral transmission. The Cuban model stands as a bold and disturbing example of the exercise of public health powers to the exclusion of all other social values. This presentation will discuss the Cuban challenge and drawing on the experience of the United States, Sweden, Bavaria and South Africa analyze its relevance to other nations.

The.O.6A BLEACHMAN: A SUPER-HERO TEACHES AIDS PREVENTION
Pappas, Liz*¹; Durazzo, R.*; Repella, A. J.*²
¹San Francisco AIDS Foundation, San Francisco, CA., USA;
²Mid-City Consortium to Combat AIDS, San Francisco, CA., USA

Objective: To educate IVUDs about the risk of HIV transmission and the effectiveness of using bleach to clean hypodermic syringes. To motivate IVUDs to adopt safe needle using and sexual behaviors to limit the spread of HIV.
Methods: A super-hero character was developed with extensive use of focus groups and field testing. BLEACHMAN appears in posters, brochures, billboards, hot cards, newspaper ads, television commercials, and on t-shirts. He also appears live (in an 8 foot super-hero costume with a bleach bottle for a head) and leads regular street outreach efforts. On the streets, accompanied by t-shirt wearing volunteers, BLEACHMAN talks to IVUDs and distributes bleach and condoms. BLEACHMAN has attracted the attention of IVUDs and their partners as well as extensive coverage in the media.
Results: 8% of 165 randomly selected IVUDs have been reached by this AIDS prevention campaign. Of the IVUDs who acknowledged sharing needles (80% of the total group) 87.7% reported they were more likely to use bleach to clean their needles as a result of their exposure to BLEACHMAN.
Conclusion: The ability to reach IVUDs indicates the effectiveness of this combined grass-roots and media strategy. BLEACHMAN represents a unique interactive approach to AIDS prevention. This is the first time IVUDs have had a hero who cares about their well being and they have responded with appropriate knowledge and behavior changes. AIDS prevention campaigns aimed at IVUDs can be effective if they are non-threatening and respectful of the target population.

Année/Year: 1989

Le counseling est devenu un élément capital dans les traitements médicaux ou le dépistage d'anticorps reliés au SIDA. L'intervenant doit aider les personnes atteintes à comprendre l'infection par le VIH, ses modes de transmission et ses possibilités de traitement; il doit aussi les aider à faire face à leur situation tout en abordant les problèmes de la confidentialité, des droits, des responsabilités et du consentement éclairé. Ces deux films vidéo destinés à la formation de consultants (le premier en anglais, le deuxième en français) ont été choisis parmi plusieurs autres propositions sur le sujet.

Counselling has become a vital element in AIDS-related medical treatment or antibody testing. As well as helping people understand HIV infection, transmission routes and treatment possibilities, the care provider must help people to cope with their situation while addressing issues such as confidentiality, rights, responsibilities and informed consent. These two videos for counsellor training (the first in English, the second in French) were chosen from many submissions on the subject.

La vidéo offre toute une panoplie de méthodes pour poser un regard historique et analytique sur le sujet. Ce groupe éclectique d'artistes et de militants du monde des arts aborde les problèmes de la sexualité, de l'orientation sexuelle, du racisme, du sexisme, de la politique de la santé, de diverses phobies reliées au SIDA, des stéréotypes et de la considération du SIDA comme une catastrophe idéologique. Ces films vont de l'analyse visuelle à l'analyse textuelle en essayant de comprendre comment s'articule le discours sur le SIDA.

Video offers the use of a myriad of historical and analytical methods. This diverse grouping of artists and aesthetic activists touches on issues of sexuality, sexual orientation, racism, sexism, politics of health, various AIDS-related phobias, stereotyping and confronting AIDS as an ideological catastrophe. It ranges from visual to textual analysis attempting to understand the construction of AIDS discourse.

La prise en charge de soi-même est devenue essentielle pour vivre avec le SIDA. Ces films scrutent la vie d'hommes et de femmes porteurs du VIH et examinent d'autres moyens de faire face aux dangers de l'affaiblissement du système immunitaire et à une société hostile. Films des États-Unis, de Suède, de Grande-Bretagne et du Canada.
Self empowerment has become the key to living with AIDS. These videos investigate the lives of those affected by HIV infection and examine alternative means of coping with the hazards of a weakened immune system and a hostile society. Presentations from the United States, Sweden, Britain and Canada.

Trois films, trois situations, trois techniques visuelles : illustration du SIDA au travail et des dilemmes qui en découlent, un regard personnel sur une famille aux prises avec une infection par le VIH et une analyse documentaire des effets négatifs de la réaction de la société au SIDA. Ces documents offrent une vision éclairante des problèmes inhérents à un monde dominé par la peur et les préjugés et présentent les diverses manières dont des personnes atteintes font face à ces difficultés.

Three videos, three situations and three visual techniques: 2 dramatizations of AIDS in the workplace and resulting dilemmas, a personal look at a family dealing with HIV infection, and a documentary analysis of the negative effects of society's response to AIDS. Each gives an insightful look at the problems inherent in a world of fear and prejudice and the various ways by which PWAs cope with these difficulties.

Le militantisme artistique et la résistance culturelle face au SIDA ont entraîné une prolifération de films et de vidéos. Cette séance en présente parmi les meilleurs. Des défilés de mode provocateurs aux vidéos musicaux subversifs, de la désobéissance civile à l'analyse critique des médias, les stratégies esthétiques illustrées prouvent qu'il ne faut pas seulement réinventer la politique du SIDA mais aussi le langage du SIDA.

Aesthetic activism and cultural resistance in response to AIDS has meant a proliferation of videos. This session is a sampling of some of the best. From guerrilla fashion shows to subversive music videos, from civil disobedience to media deconstruction, the aesthetic strategies illustrated show that not just the politics of AIDS but the politics of language related to AIDS needs to be reinvented.

Les clips Clips

16:00 Introduction: René Lavoie

16:15 W.I.V.15

Clips télévisés du monde entier
Television spots from around the world

Les campagnes de prévention restent le principal moyen d'informer le grand public. Beaucoup d'organismes, gouvernementaux et communautaires, ont essayé d'intervenir en utilisant les techniques médiatiques existantes comme les messages télévisés d'intérêt public ou des clips spécialisés pour les lieux publics.

Ces clips sont réservés ou conservateurs, explicites ou hilarants, réactionnaires ou fascinants. Ils sont juxtaposés à dessein pour amener le public à choisir activement entre la peur et la prise en charge de soi.

Prevention campaigns remain the primary means of getting information to the general public. Many organizations, both government and community-based, have tried to intervene using existing media techniques such as Television Public Service Announcements (PSA's) or community-specific shorts intended for use in public venues.

These clips vary from coy to conservative, explicit to hilarious, reactionary to riveting. They are purposefully juxtaposed to force the audience to actively participate in choosing between promotion of fear or of empowerment.

La prévention reste le noyau fondamental de toute intervention contre le SIDA. Puisant dans le déluge de films vidéos proposés, cette séance présente un aperçu général des techniques de prévention mises en oeuvre pour de nombreux groupes cibles : toxicomanes, travailleurs du secteur de la santé et des services sociaux, personnels paramédicaux, prostituées, homosexuels et jeunes.

The nucleus of AIDS work remains prevention. From the deluge of videos submitted on the subject, this session provides an overview of prevention techniques for many target groups: drug users, health care workers, paramedics, prostitutes, gay men and youth.

Le Ministère de la Santé nationale et du Bien-être social est responsable des questions relatives à la promotion et au maintien de la santé, à la sécurité sociale et au bien-être social des Canadiens qui relèvent du Parlement du Canada. Des exemples de ses responsabilités sont l'application des lois touchant à la santé, à la sécurité sociale et au bien-être social des Canadiens; la conduite d'enquêtes et de recherches dans les domaines de la santé publique et du bien-être social; les services d'information sur les conditions et les pratiques sanitaires; les services de santé pour les Indiens et les Inuits, les habitants du Yukon et des Territoires du Nord-Ouest, les fonctionnaires fédéraux, les immigrants et le personnel de l'aviation civile; la coopération et la coordination avec les gouvernements provinciaux sur les questions de santé, de sécurité sociale et de bien-être social; et la collecte, la publication et la diffusion d'informations sur la santé, la sécurité sociale et le bien-être social.

Une importante partie des efforts que déploie le Ministère pour préserver et améliorer la santé et le bien-être social de tous les Canadiens exige la collaboration avec les autorités provinciales et territoriales. La nécessité de mener des activités conjointes dans certains secteurs découle de la division constitutionnelle des responsabilités et de l'existence de programmes fédéraux dont l'objet est d'aider les provinces et les territoires à assurer leurs propres programmes de services sanitaires et sociaux.

Les responsabilités et les activités du Ministère sont concentrées dans les principaux secteurs suivants : la sécurité du revenu pour les particuliers et les familles; les services sociaux de base, particulièrement pour les Canadiens défavorisés sur le plan socio-économique; l'universalité d'accès à des services de santé adéquats pour tous les Canadiens; la protection contre la maladie et les risques liés à l'environnement; la promotion de modes de vie sains; l'essor, l'encouragement et le développement de la condition physique et du sport amateur.

Les principales stratégies par lesquelles le Ministère s'acquitte de ses responsabilités sont les suivantes : transferts aux particuliers, transferts aux gouvernements provinciaux et territoriaux (sans oublier les groupes autochtones), recherche, réglementation et surveillance, services directs à des groupes particuliers, consultation, conseils, information et promotion.

Une brève description des divers programmes suit :

Services et promotion de la santé : Ce Programme assure un appui financier et technique aux provinces et territoires au titre des services de santé assurés et de certains services complémentaires de santé. Il encourage également l'adoption et la conservation de saines habitudes de vie, et stimule la recherche en santé publique.

Services sociaux : Ce Programme contribue à assurer de l'aide sociale et des services sociaux aux personnes qui n'ont pas les moyens financiers de satisfaire leurs besoins fondamentaux, ou qui, en raison de circonstances sur le plan social, sont exposés à la pauvreté, à l'isolement ou à la dépendance.

Services médicaux : Ce Programme assure des services de santé à plusieurs groupes de clients. Les principales activités s'adressent aux Indiens inscrits et aux Inuits de tout le pays, ainsi qu'à tous les habitants du Yukon et des Territoires du Nord-Ouest. Des services de santé sont également fournis aux fonctionnaires fédéraux, aux immigrants, aux résidents temporaires, aux voyageurs internationaux, au personnel de l'aviation civile, aux personnes physiquement handicapées et aux victimes de catastrophes.

Protection de la santé : Ce Programme vise à éliminer les risques pour la santé liés à des facteurs environnementaux, naturels ou artificiels, pouvant être cause de maladies et de décès prématurés. Les principales activités portent sur l'évaluation et le contrôle de la qualité et de la sécurité des aliments, ainsi que de la sécurité et de l'efficacité des médicaments et des appareils médicaux; l'identification et l'évaluation des risques liés au milieu; la surveillance des maladies; et la fourniture de services de laboratoire spécialisés.

Sécurité du revenu : Ce Programme a pour but de maintenir et d'améliorer la sécurité du revenu des Canadiens. Trois grands programmes de sécurité du revenu sont administrés : le Régime de pensions du Canada, la Sécurité de la vieillesse et des Allocations familiales. Un programme d'évaluation de l'invalidité est également appliqué dans le cadre de la Loi de l'impôt sur le revenu.

Condition physique et Sport amateur : Ce Programme contribue à améliorer la condition physique des Canadiens et à promouvoir l'excellence dans le sport amateur canadien sur les plans national et international.

Administration centrale : Ce Programme fournit au Ministère des services de direction et de gestion.

Health and Welfare Canada

The Department of National Health and Welfare is responsible for matters related to the promotion and preservation of the health, social security and social welfare of the people of Canada over which the Parliament of Canada has jurisdiction. Major examples of these responsibilities include administration of legislation relating to the health, social security, and welfare of the people of Canada; investigation and research into public health and welfare; information services relating to health conditions and practices; health services for Indian and Inuit people, residents of the Yukon and Northwest Territories, federal government employees, immigrants and civil aviation personnel; cooperation and coordination with provincial governments on matters of health, social security and welfare; and collection, publication and distribution of information relating to health, social security and welfare.

A significant amount of Departmental activity involves collaboration with provincial and territorial authorities in efforts to preserve and improve the health and social well-being of all Canadians. The need for joint activity in certain areas arises from the constitutional division of responsibilities and the existence of federal programs which assist provinces and territories to maintain their own health and social service programs.

Departmental responsibilities and activities are focused on the following principal objectives: income security for individuals and families; essential social services, particularly for socially and economically disadvantaged Canadians; universal access for all Canadians to quality health services; protection against disease and environmental hazards; promotion of healthy lifestyles; promotion, encouragement and development of fitness and amateur sport.

The major strategies through which the Department carries out its responsibilities are: transfers to individuals, transfers to provincial and territorial governments and to native groups, research, regulation and surveillance, direct service to specific groups, advice, consultation, information and promotion.

Following is a brief description of the various programs:

Health Services and Promotion: This Program provides financial and technical support to the provinces and territories for insured health care services and certain extended health care services. The Program also promotes the adoption and maintenance of healthy lifestyles and fosters public health research.

Social Services: This Program supports the provision of social assistance and services to persons whose economic circumstances are inadequate to meet their basic needs or whose social circumstances expose them to risk of poverty, isolation or dependency.

Medical Services: This Program provides health services to several client groups. The major activities are directed towards registered Indians and Inuit throughout Canada and residents of the Yukon and Northwest Territories. Clients also include federal public servants, immigrants and temporary residents, international travellers, civil aviation personnel, the physically handicapped and disaster victims.

Health Protection: This Program endeavors to eliminate health hazards associated with the natural and man-made environments that lead to illness and untimely death. Principal activities include: assessment and control of the quality and safety of food, and safety and effectiveness of drugs and medical devices; the identification and assessment of environmental hazards; the surveillance of diseases; and the provision of specialized laboratory services.

Income Security: This Program is responsible for maintaining and improving the income security of the people of Canada. It administers three major income security programs: The Canada Pension Plan, Old Age Security and Family Allowances. It also assists in the administration of the Income Tax Act through a disability certification.

Fitness and Amateur Sport: This Program contributes to the increased fitness of Canadians and the promotion of excellence in domestic and international amateur sport by Canadians.

Departmental Administration: This Program provides executive direction and management services to the Department.

ACDI

Créée en 1968, l'Agence canadienne de développement international (ACDI) est l'organisme du gouvernement fédéral responsable de la gestion d'environ 75 % de l'aide publique au développement accordée par le Canada aux pays en développement.

Depuis 1987, l'ACDI participe à la lutte contre le SIDA dans le monde en appuyant le Programme mondial de lutte contre le SIDA (PMLS) de l'Organisation mondiale de la santé ainsi que les programmes nationaux de lutte contre le SIDA. L'ACDI estime que les efforts déployés pour lutter contre le SIDA dans les pays en développement devraient également permettre d'améliorer et de renforcer les systèmes de soins de santé primaires établis dans ces pays.

L'aide de l'ACDI vise principalement à soutenir les cinq stratégies communes à la plupart des programmes nationaux de lutte contre le SIDA, notamment : le contrôle épidémiologique; la prévention contre la transmission de la maladie par relations sexuelles, par la transfusion sanguine ou autres produits sanguins, ou encore pendant la période périnatale; et la réduction des effets du SIDA sur les individus et sur la société.

À l'intérieur de ce cadre d'intervention très large, l'ACDI a apporté son soutien à la réalisation d'enquêtes sur la connaissance du SIDA, sur les attitudes à son égard et sur les pratiques sexuelles; à diverses initiatives en matière d'information, d'éducation et de communication; à la lutte contre les maladies transmises sexuellement; aux traitements palliatifs; aux services de conseils aux personnes infectées et à leurs partenaires; à la protection des réserves nationales de sang; au perfectionnement du personnel de laboratoire et des méthodes de diagnostic. Les compétences des universités canadiennes, d'autres organismes gouvernementaux et des organisations non gouvernementales ont rendu possible la mise en place d'un bon nombre de ces activités et continueront à favoriser la réalisation d'autres initiatives de ce genre.

Les engagements financiers de l'Agence en matière de lutte contre le SIDA, atteignent actuellement plus de \$45 millions. L'ACDI est l'un des plus importants donateurs au PMLS, lui ayant fourni la somme totale de \$14,5 millions de 1987 à 1989.

À travers ses programmes bilatéraux, l'ACDI appui des programmes pluriannuels dans de nombreux pays d'Afrique, des Antilles et de l'Amérique latine, dans le cadre de leurs programmes nationaux de lutte contre le SIDA. Ainsi, l'ACDI s'est engagée à verser \$6,3 millions à l'Afrique anglophone et \$22,8 millions à l'Afrique francophone : ces sommes permettront la réalisation de différents projets, dont la préparation d'une brochure d'information en portugais qui sera distribuée au Mozambique ainsi que d'un programme intensif de huit ans, mis en oeuvre en Afrique francophone. Les interventions réalisées dans le cadre de ce programme seront concentrées dans les domaines de l'information, de l'éducation, de la communication, du perfectionnement des ressources humaines, de l'épidémiologie et des études en anthropologie.

En Amérique latine et aux Antilles, l'ACDI a accordé \$3,2 millions pour l'exécution de programmes régionaux et nationaux de lutte contre le SIDA.

D'autre part, la Direction générale des Programmes spéciaux de l'ACDI a affecté \$1,4 million à la réalisation de trois projets de lutte et d'information administrés par des organisations non gouvernementales. Dans le cadre de ces projets, on préconise l'utilisation d'une bande dessinée conçue à l'intention des enfants de la rue ainsi que celle de documents d'information que distribuera la Fédération internationale de planning familial.

D'autres projets sont actuellement à l'étude et il est à prévoir que la contribution de l'ACDI à l'effort international de lutte contre le SIDA augmentera à la faveur de la naissance de nouvelles initiatives et de la mise en place de nouveaux programmes nationaux de lutte contre le SIDA.

CIDA

Created in 1968, the Canadian International Development Agency (CIDA) is the federal government agency responsible for approximately 75 per cent of Canada's official development assistance to developing countries.

Since 1987, CIDA has contributed to the global fight against AIDS by supporting the World Health Organization's Global Program on AIDS (GPA), and national AIDS control programs. The Agency sees AIDS-control efforts as opportunities to complement and strengthen existing primary health care systems in developing countries.

CIDA's assistance primarily supports five basic strategies common to most national AIDS control programs: epidemiological surveillance; prevention of sexual transmission; prevention of transmission through blood and blood products; prevention of perinatal transmission; and reduction of the impact of AIDS on the individual and society.

Within these broad approaches, CIDA has supported surveys of AIDS knowledge, attitudes concerning AIDS and sexual practices; information, education and communication initiatives; control of sexually transmitted diseases; palliative care; counselling of infected individuals and their partners; protection of national blood supplies; and upgrading of laboratory personnel and diagnostic procedures. The expertise of Canadian universities, other government agencies, and non-governmental organizations has been instrumental in many of these endeavors, and will contribute to future initiatives.

The Agency's spending commitments on AIDS control projects now total over 45\$ million. CIDA is among the largest donors to the GPA, having contributed a total of \$14.5 million from 1987 to 1989.

Through the bilateral channel, CIDA supports multi-year programs in many African, Caribbean and Latin American countries, within the context of their national AIDS control programs. CIDA has committed \$6.3 million in Anglophone Africa, and \$22.8 million in Francophone Africa. Projects range from the preparation of an AIDS information pamphlet in Portuguese for distribution in Mozambique, to an eight-year intensive project in Francophone Africa, focusing on information, education, communication, human resource training, epidemiology, and anthropological studies.

In Latin America and the Caribbean, CIDA has designated \$3.2 million for sub-regional and national AIDS control programs.

Through the Special Programs Branch, \$1.4 million has been allocated to three projects administered by non-governmental organizations involving AIDS control or information. These projects include an instructional cartoon for street children, and support for the dissemination of information by the international Planned Parenthood Federation.

A number of additional projects are in the discussion phase, and CIDA's contribution to international AIDS programming is expected to increase as new initiatives and more national programs develop.

Le CRDI est une société d'État créée par le Parlement du Canada en 1970. La mission du CRDI consiste à favoriser le développement du Tiers-Monde par la recherche et des activités connexes.

Par "développement", le CRDI désigne le processus d'évolution sociale et économique constant en vertu duquel les habitants d'un pays parviennent à déterminer quels changements ils devraient apporter à leur société et comment effectuer ceux-ci. Pour cela, les pays en développement doivent participer à la prise de décision sur un pied d'égalité avec les autres pays et doivent profiter pleinement des conséquences du changement. Cette forme de développement permet aux habitants du Tiers Monde d'améliorer leurs conditions de vie sans pour autant sacrifier leur dignité et le respect d'eux-mêmes.

Le CRDI est convaincu que cette forme de développement est plus susceptible de se manifester quand une population mange à sa faim, est en bonne santé, manifeste un esprit d'indépendance, est fière de ses réalisations, respecte les droits d'autrui et voit les autres respecter les siens. C'est pourquoi elle parraine les recherches destinées à faire naître ces conditions.

Objectifs

Le but principal poursuivi par le CRDI est de soutenir la recherche pertinente au développement et dont les résultats probables faciliteraient les activités dans ce domaine. Le Centre s'intéresse particulièrement aux projets qui se concentrent sur les problèmes liés à la pauvreté.

En deuxième lieu, il vise à consolider les capacités de recherche des pays en développement. Comme il préconise une intégration suffisante de ses activités, le Centre prend grand soin de rattacher l'aide qu'il prodigue en formation aux projets et aux programmes de recherche qu'il soutient.

Son troisième objectif est de promouvoir la diffusion, la vulgarisation et l'application des résultats des projets qu'il parraine.

Un quatrième objectif consiste à établir des liens entre les scientifiques des pays en développement et à aider ceux-ci à avoir accès aux résultats des travaux poursuivis un peu partout dans le monde.

Pour y parvenir, le CRDI finance des groupes et des établissements de recherche dans les pays en développement et soutient des réseaux et des organismes régionaux dans le Tiers Monde. Ainsi, il espère créer un noyau de chercheurs dans chaque pays et favoriser le développement de réseaux de personnes et d'établissements qui disposeront des ressources nécessaires à la réalisation des projets de recherche et à l'exploitation de leurs résultats.

Depuis 1970, le CRDI a ainsi contribué à plus de 3 500 projets auxquels participent au-delà de 10 000 scientifiques de 900 établissements répartis dans plus de 100 pays.

Bureaux

Le CRDI compte sept bureaux—le siège social, à Ottawa, et six bureaux desservant diverses régions des pays en développement : Bogota, Colombie; Le Caire, Égypte; Dakar, Sénégal; New Delhi, Inde; Nairobi, Kenya; Singapour.

Pour de plus amples renseignements sur le CRDI et les projets subventionnés par le CRDI dans les pays en développement, veuillez vous adresser à :

IDRC is a public corporation created by the Parliament of Canada in 1970. IDRC's mission is to contribute to development in the Third World through research and activities which support research.

IDRC uses the term "development" to mean a continuing process of social and economic change in which people have the power and ability to decide what changes to make in society, and how to make them. They must be able to participate equally in these decisions, and to share fully in the results of change. This kind of development makes people's lives materially better and encourages a sense of dignity and self-respect.

IDRC believes that this kind of development is most likely to happen when people eat properly, are healthy, have a sense of independence, are proud of their achievements, respect the rights of others and have their rights respected. It supports research which tries to foster these conditions.

Objectives

IDRC's main objective is to support research relevant to development and whose likely results could be used in development work. The Centre is especially concerned with research on the problems of poverty.

A second objective is to build up the research capacity and capability of developing countries. Since it wants its activities to be relatively well-integrated, the Centre very carefully links most of its support of training to research projects and programs it supports.

A third objective is to promote the diffusion, popularization and application of the results of the research which the Centre supports.

A fourth objective is to develop links among developing country researchers, and to provide them access to the results of world-wide research.

To achieve these objectives, IDRC funds research groups and institutions in developing countries, and provides some support to regional networks and institutions in the Third World. This support is designed to build a corps of researchers in each country, and to help develop the networks of people and institutions which provide the services needed to get research done and to use its results.

IDRC has supported more than 3,500 projects involving over 10,000 researchers in 900 institutions in more than 100 countries.

Offices

IDRC has its headquarters in Ottawa plus six regional bureaus to service particular regions of the developing world: Bogota, Colombia; Cairo, Egypt; Dakar, Sénégal; New Delhi, India; Nairobi, Kenya; Singapore.

Qu'est-ce que l'OMS?

L'Organisation mondiale de la Santé (OMS), institution spécialisée des Nations Unies créée en 1948, a 166 états membres. Elle agit en tant qu'autorité directrice et coordonnatrice, dans le domaine de la santé, des travaux ayant un caractère international. Les organes directeurs de l'OMS sont l'Assemblée mondiale de la Santé, "parlement" de la santé publique qui se réunit deux semaines par an, et le Conseil Exécutif, composé de 31 experts de la santé qui se réunissent deux fois par an.

Le secrétariat de l'OMS comprend environ 5 000 spécialistes opérant dans plus de 100 pays. Quelques-uns d'entre eux travaillent au siège de Genève et collaborent avec six bureaux régionaux en Afrique, dans les Amériques, en Méditerranée orientale, en Europe, en Asie du Sud-Est et dans le Pacifique occidental.

Les états membres contribuent directement au budget ordinaire de l'OMS—plus de 300 millions US \$ par an—et des contributions volontaires additionnelles, qui doublent pratiquement le budget de fonctionnement, financent des programmes spéciaux tels que le SIDA, la reproduction humaine, les maladies diarrhéiques et la recherche concernant les maladies tropicales.

La "Santé pour Tous" est le principal but de santé sociale que se sont fixés les gouvernements et l'OMS pour les décennies à venir. De nombreuses organisations non gouvernementales apportent leur appui et les individus sont encouragés à "s'aider eux-mêmes". La "Santé pour Tous" a été définie par l'Assemblée mondiale de la Santé comme "un niveau de santé qui permette aux gens de mener une vie socialement et économiquement productive".

Sous la tutelle impartiale de l'OMS, les pays ont au cours des 40 dernières années combattu ensemble les fléaux de l'humanité. Un exemple en est la variole, la première maladie mortelle jamais éradiquée de la surface du globe. L'OMS s'est maintenant engagée à éradiquer la poliomyélite, qui paralyse encore quelque 275 000 enfants chaque année. Grâce au programme de l'OMS de lutte contre la cécité des rivières, des millions d'enfants d'Afrique de l'Ouest ne deviendront plus aveugles. En 10 ans, le pourcentage des enfants vaccinés contre six maladies mortelles est passé de 5 à plus de 50%. À ce jour, plus de 100 gouvernements ont adopté la liste modèle de l'OMS des 200 médicaments considérés comme essentiels.

Les succès sont nombreux, mais les défis restent impressionnants. Des millions de gens sont encore pris dans un cercle vicieux de pauvreté, de malnutrition et de maladie et n'ont pas accès aux soins médicaux, à une eau saine et à des systèmes d'élimination des déchets. La pandémie de SIDA exigera pendant de nombreuses années une mobilisation mondiale. Pour relever ces défis, l'OMS souligne que l'engagement politique et la participation des populations seront des facteurs essentiels.

The World Health Organization (WHO), a specialized agency of the UN created in 1948, has 166 Member States. Its mandate is to act as the directing and coordinating authority on international health work. The two governing bodies of WHO are the World Health Assembly—a public health “parliament” which meets for two weeks every year—and the Executive Board, composed of 31 health experts who meet twice a year.

The Secretariat of WHO comprises some 5,000 specialists working in more than 100 countries. Of these, about 1,500 work at the headquarters in Geneva and there are six Regional Offices in Africa, the Americas, the Eastern Mediterranean, Europe, South-East Asia and the Western Pacific.

Member States contribute directly to the WHO regular budget—over US \$ 300 million per year—and additional voluntary contributions, which virtually double the working budget, support special programmes such as AIDS, human reproduction, diarrhoeal disease control and tropical disease research.

“Health for All” is the main social health target of governments and WHO for the coming decades. Valuable support to achieve this goal comes from numerous nongovernmental organizations, and much emphasis is placed on helping individuals to help themselves. Successive World Health Assemblies have defined “Health for All” as “a level of health that will permit people to lead a socially and economically productive life.”

Under the “neutral umbrella” of WHO, countries have, over the past 40 years, cooperated to combat together the scourges of humanity. An example is smallpox, the first killer disease ever to be eradicated from the world. Now WHO aims at eradicating polio, which still cripples about 275,000 children every year. As result of WHO’s river blindness control programme, millions of children in West Africa no longer risk going blind. Immunization coverage of children against six killer diseases—measles, tuberculosis, whooping cough, tetanus, polio and diphtheria has increased from 5% to over 50% in 10 years. To date, more than 100 governments have adopted the WHO model list of 200 drugs considered essential for good medical practice.

The list of achievements is very long but the challenges that remain are daunting. Millions of people are still trapped in a vicious cycle of poverty, malnutrition and disease, and have no access to medical care, clean water and safe waste disposal. The AIDS pandemic will require a global mobilization for many years to come. To meet these challenges, WHO underlines that the vital factors will be political commitment and people’s involvement.

Le Québec s'est doté d'un premier plan d'action sur le SIDA en 1987. Un groupe de travail, formé d'experts et de professionnels, a alors été constitué afin de fournir des éléments de réponse sur les questions éthiques et légales, la prévention, les soins, les aspects psychosociaux et la recherche.

La synthèse de ces travaux est devenue la principale source d'information à la base de la deuxième phase du plan d'action lancé par la Ministre de la Santé et des Services sociaux à l'occasion de la Journée mondiale du SIDA, le 1^{er} décembre 1988. Cette phase II comporte des mesures regroupées dans plusieurs champs d'activités avec prédominance de la prévention.

La prévention, par l'information et l'éducation, demeure encore le moyen le plus efficace de lutte contre le SIDA. Le Québec a identifié plus particulièrement quatre clientèles auprès desquelles devront s'articuler les efforts: la population en général, le milieu scolaire et la jeunesse, les personnes susceptibles de contracter le SIDA et celles avec lesquelles elles ont été en contact, et enfin certains groupes-cibles.

Le plan prévoit aussi des mécanismes d'information et de support pour toute personne désireuse de connaître sa situation par rapport au SIDA, des services de dépistage et de counseling, des subventions à des organismes communautaires pour des fins de support et d'entraide, des modalités pour la surveillance épidémiologique et des mécanismes de surveillance éthique relativement aux enquêtes de séroprévalence. Par ailleurs, des activités de formation et d'information sont prévues pour le personnel du réseau de la santé et des services sociaux, qui regroupe plus de 900 établissements.

En matière de soins hospitaliers, le plan d'action prévoit l'accessibilité à des services dans l'ensemble des centres hospitaliers québécois ainsi que la mise en place d'unités SIDA d'un maximum de 20 lits.

Pour les services complémentaires, l'orientation qui a été développée consiste à répondre aux attentes des malades qui souhaitent demeurer le plus possible dans leur milieu de vie ou dans un contexte qui lui ressemble. Ainsi, des projets pilotes de maisons d'hébergement ou de familles d'accueil spéciales et un programme de soins et d'aide à domicile sont mis en place.

L'évolution rapide de la maladie et l'état précaire des connaissances sur ce sujet nécessitent un accroissement des efforts en matière de recherche. Des fonds seront donc investis dans le développement de la recherche psychosociale et biomédicale et dans le perfectionnement des chercheurs.

Enfin, toutes les interventions seront l'objet d'une coordination et d'une évaluation visant à mesurer leur pertinence eut égard aux objectifs visés et aux résultats escomptés.

SANDOZ

SANDOZ Ltd., dont le siège social est situé à Bâle en Suisse, emploie plus de 43 000 personnes dans le monde entier dans des domaines aussi divers que la recherche et le développement, la fabrication de produits pharmaceutiques, chimiques et de matières colorantes, la nutrition et les produits agricoles.

Les recherches effectuées par Sandoz touchent cinq domaines de la médecine : neurologie, cardiologie, endocrinologie, immunologie et dermatologie. Cette entreprise investit, à l'échelle mondiale, plus de 700 \$ millions par an dans la recherche fondamentale et la recherche clinique. Les spécialités pharmaceutiques Sandoz comprennent des produits tels que le Parlodel (bromocriptine) et le Sandimmune (cyclosporine) qui représentent de grands progrès scientifiques. Ce dernier produit, en particulier, a ouvert la voie à la transplantation et à la maîtrise du système immunologique.

Sandoz contribue aux travaux de recherche des professionnels de la santé en parrainant des colloques sur la science et la médecine. Depuis plus d'un siècle, des hommes et des femmes chez Sandoz ont participé activement à une véritable révolution sociale. Grâce à leur esprit innovateur et leur désir de partager leurs connaissances scientifiques, leurs travaux ont permis des améliorations importantes dans les sciences médicales et la santé. C'est ainsi que certains médicaments les plus remarquables du XX^e siècle sont des produits provenant de la recherche entreprise par Sandoz.

Sandoz Ltd., with headquarters in Bâle, Switzerland, employs over 43,000 people around the world in research, development and manufacture of pharmaceuticals, chemicals and dye stuffs, nutrition and agricultural products.

SANDOZ directs its medical research into five main areas; Neurology, Cardiology, Endocrinology, Immunology, and Dermatology. The company invests more than \$700 million annually in basic and clinical research worldwide. SANDOZ medications include such breakthrough products as Parlodel (bromocriptine) and Sandimmune (cyclosporine). The discovery of Sandimmune has opened the road to organ transplantation and, ultimately, to control of the immune system.

SANDOZ contributes to the work of the health care community through the sponsorship of medical and scientific education forums. In fact, some of the most notable and advanced medications of the 20th Century are products of Sandoz research. For over a century now, the men and women of Sandoz have been active participants in a veritable social revolution. Through their spirit of innovation and desire to share knowledge, their endeavors have contributed to major improvements in medical science and human health.

Chaque année, la Société canadienne de la Croix-Rouge vient en aide à un Canadien sur six. Elle dessert la population à partir de plus de 1 000 postes non officiels, 608 sections, 10 bureaux divisionnaires provinciaux et territoriaux, et 17 centres de transfusion sanguine au Canada. C'est le siège social à Ottawa qui est responsable du Programme du sang et des Services internationaux, et qui coordonne 16 services de santé et d'action communautaire au pays. Toujours au siège social, le Laboratoire central constitue le centre de consultation du système canadien de transfusion sanguine et veille à l'élaboration et au respect des normes établies à l'égard du sang et des produits sanguins. La Société canadienne de la Croix-Rouge désire remercier la "Vancouver PWA Society" et le Comité des personnes atteintes du virus de l'immunodéficience humaine (CPAVIH) du Comité SIDA Aide Montréal (CSAM), pour leur aide au centre d'accueil et de repos pour les personnes atteintes du SIDA.

The Canadian Red Cross Society touches the lives of one in six Canadians every year. Its services are delivered through more than 1,000 informal units, 608 branches, 10 provincial/territorial divisions, and 17 blood centres across Canada. The National Office in Ottawa is responsible for the national blood program and international services, and co-ordinates 16 health and community initiatives across the country. The National Office includes the NRL (National Reference Laboratory), the reference centre for the national blood system, developing and monitoring the standards and quality of blood and blood products. The Canadian Red Cross Society gratefully acknowledges the assistance of the Vancouver PWA Society and the PWA Committee of CSAM (Comité SIDA Aide Montréal) in the operation of the PWA Rest and Welcome Centre.

**The Life and
Health Insurance
Companies in
Canada**

Cent soixante-cinq sociétés d'assurance-vie offrent leurs services aux Canadiens. En coordonnant ses efforts et en allouant des ressources financières, l'industrie canadienne des assurances de personnes est en mesure d'apporter une aide importante à la lutte contre le SIDA et de faire ainsi preuve d'initiative dans ce domaine.

En 1987, elle a mis sur pied un Groupe de travail des chefs de direction sur les projets concernant le SIDA pour faire face à la menace que constitue cette maladie dévastatrice pour l'industrie et l'ensemble de la société.

Le plus sûr moyen d'enrayer la propagation du SIDA étant la prévention, l'objectif principal des projets parrainés par l'industrie est donc l'information, en particulier celle diffusée en milieu de travail et auprès des jeunes. L'industrie a financé un certain nombre de projets à cet égard et est constamment à la recherche d'autres projets dignes d'intérêt.

Canadians are served by 165 active life insurance companies. Through collective action and funding, the life and health insurance companies in Canada have the opportunity to make a significant contribution to the fight against AIDS and to show leadership on this issue in this country.

In 1987, the life and health insurance industry formed a CEO Task Force on AIDS Projects in response to the threat this devastating disease poses to business and to society.

The life and health insurance companies in Canada consider prevention the one sure way to curb the spread of AIDS. Therefore, the primary focus for industry-sponsored projects is on education, especially among young people and in the workplace. The industry has funded a number of projects in this area and is continually seeking other projects appropriate for consideration.

One of the companies that make up AKZO's Pharma Division, ORGANON TEKNIKA focuses its activities on the R&D, manufacturing and marketing of high-tech products for hospitals, blood banks and laboratories.

From its headquarters in Turnhout, Belgium, ORGANON TEKNIKA serves a worldwide market via 40 local companies in all important geographical regions and production sites in the Netherlands, Ireland and the United States of America.

ORGANON TEKNIKA provides a range of HIV diagnostics for a range of applications. The latest contributions to the diagnosis, monitoring or confirmation, of HIV-infection are VIRONOSTIKA ANTI-HIV UNI-FORM (compatible with testing procedures for HBsAg and anti-HBc),

VIRONOSTIKA HIV antigen, VIRONOSTIKA anti-Core and VIRONOSTIKA anti-ENV, which will be introduced at the V International Conference on AIDS together with HIV-LIA. Accomplishments diagnostic system, which also includes for instance the HEPANOSTIKA line of HAV and HBV assays and an extensive series of modern tests and dedicated equipment for still other viral, bacterial, parasital and endocrinological parameters.

With more than 25 years of experience in the field—including the invention of worldwide accepted standards like ELISA—ORGANON TEKNIKA has become a trendsetter in the systematizing of diagnostic praxis.
